Let A B C D (in the first figure) be any Ponderant whatsoever; and in it let E F be a Plain of Equiponderation; parallel to which, let any other Plain be drawn, as G H. I say G H is not a Plain of Equiponderation. For seeing the parts A E F D and E B C F of the Ponderant A B C D, are equally pois'd; and the weight E G H F is added to the part A E F D, and nothing is added to the part E B C F, but the weight E G H F is taken from it; therefore (by the first Supposition) the parts A G H D and G B C H will not be equally pois'd; and consequently G H is not a Plain of Equiponderation. Wherefore, No two Plains of Equiponderation, &c. Which was to be proved.

3 The Center of Equiponderation is in every Plain of Equiponderation.

For if another Plain of Equiponderation be taken, it will not (by the last Article) be parallel to the former Plain; and therefore both those Plains will cut one another. Now that Section (by the 6th Definition) is the Diameter of Equiponderation. Again, if another Diameter of Equiponderation be taken, it will cut that former Diameter; and in that Section (by the 7th Definition)

is the Center of Equiponderation. Wherefore the Center of Equiponderation is in that Diameter which lies in the said Plain of Equiponderation.

4 The Moment of any Ponderant applyed to one point of the Beam, to the Moment of the same, or an equal Ponderant applyed to any other point of the Beam, is as the distance of the former point from the Center of the Scale, to the distance of the later point from the same Center. Or thus, Those Moments are to one another, as the Arches of Circles which are made upon the Center of the Scale through those points, in the same time. Or lastly thus; They are, as the parallel bases of two Triangles, which have a common angle at the Center of the Scale.

Let A (in the 2d figure) be the Center of the Scale; and let the equal Ponderants D and E press the Beam A B in the points B and C; also let the straight lines B D and C E be Diameters of Equiponderation; and the points D and E in the Ponderants D and E be their Centers of Equiponderation. Let A G F be drawn howsoever, cutting D B produced in F, and E C in G; and lastly, upon the common Center A, let the two arches B H and C I be described, cutting A G F in H and I. I say the Moment of the Ponderant D to the Moment of the Ponderant E, is as A B to A C, or as B H to C I, or as B F to C G. For the effect of the Ponderant D in the point B, is circular motion in the arch B H; and the effect of the Ponderant E in the point C, circular motion in the arch C I; and by reason of the equality of the Ponderants D and E, these motions are to one another as the Quicknesses or Velocities with which the points B and C describe the arches B H and C I, that is, as the arches themselves B H and C I, or as the straight parallels B F and C G, or as the parts of the Beam A B and A C; for $A B. A C :: B F. C G :: B H. C I$. are proportionals; and therefore the effects, that is, (by the 4th Definition) the Moments of the equal Ponderants applyed to several points of the Beam, are to one another, as A B and A C; or as the distances of those points from the center of the Scale; or as the parallel bases of the Triangles which have a

common angle at A; or as the concentrick arches B H and C I; which was to be demonstrated.

5 Unequal Ponderants, when they are applyed to several points of the Beam, and hang at liberty (that is, so as the line by which they hang be the Diameter of Equiponderation, whatsoever be the figure of the Ponderant), have their Moments to one another in proportion compounded of the proportions of their distances from the center of the Scale, and of their Waights.

Let A (in the 3d figure) be the center of the Scale, and A B the Beam; to which let the two Ponderants C & D be applied at the points B and E. I say the proportion of the Moment of the Ponderant C, to the Moment of the Ponderant D, is compounded of the proportions of A B to A E and of the Waight C to the Waight D; or (if C and D be of the same species) of the magnitude C to the magnitude D.

Let either of them, as C, be supposed to be bigger then the other D. If therefore by the addition of F, F and D together be as one Body equal to C, the Moment of C to the Moment of F + D will be (by the last article) as B G is to E H. Now as F + D is to D, so let E H be to another E I; and the moment of F + D, that is of C, to the moment of D, will be as B G to E I. But the proportion of B G to E I is compounded of the proportions (of B G to E H that is) of A B to A E, and (of E H to E I, that is) of the waight C to the waight D. Wherefore unequal Ponderants, when they are applied, &c. which was to be proved.

6 The same figure remaining, if I K be drawn parallel to the Beame A B, and cutting A G in K; and K L be drawn parallel to to B G, cutting A B in L, the distances A B and A L from the center, will be proportional to the moments of C and D. For the moment of C is B G, and the moment of D is E I, to which K L is equal. But as the distance A B from the center, is to the

distance A L from the center, so is B G the moment of the Ponderant C, to L K, or E I the moment of the Ponderant D.

7 If two Ponderants have their waights and distances from the center in reciprocal proportion, and the center of the Scale be between the points to which the Ponderants are applied, they will be equally poised. And contrarily, if they be equally poised, their waights and distances from the center of the Scale will be in reciprocall proportion.

Let the center of the Scale (in the same 3d figure) be A, the Beam A B; and let any Ponderant C, having B G for its moment, be applied to the point B; also let any other Ponderant D, whose moment is E I, be applied to the point E. Through the point I, let I K be drawn parallel to the Beam A B, cutting A G in K; also let K L be drawn parallel to B G. K L will then be the Moment of the Ponderant D; and (by the last Article) it will be as B G the Moment of the Ponderant C in the point B, to L K the Moment of the Ponderant D in the point E so A B to A L. On the other side of the center of the Scale, let A N be taken equal to A L; and to the point N let there be applyed the Ponderant O, having to the Ponderant C the proportion of A B to A N. I say the Ponderants in B and N will be equally poised. For the proportion of the Moment of the Ponderant O in the point N, to the Moment of the Ponderant C in the point B, is (by the 5th Article) compounded of the proportions of the waight O to the waight B, & of the distance (from the center of the Scale) A N or A L to the distance (from the center of the Scale) A B. But seeing we have supposed, that the distance A B to the distance A N, is in reciprocal proportion of the Waight O to the waight C, the proportion of the Moment of the Ponderant O in the point N, to the Moment of the Ponderant C in the point B, will be compounded of the proportions of A B to A N, and of A N to A B. Wherefore, setting in order A B, A N, A B, the Moment of O to the Moment of C will be as the first to the last, that is, as A B to A B. Their Moments therefore are equal; and consequently the

Plain which passes through A, will (by the fifth Definition) be a Plain of Equiponderation. Wherefore they will be equally poised; as was to be proved.

Now the converse of this is manifest. For if there be Equiponderation, and the proportion of the Waights and Distances be not reciprocal, then both the Waights will always have the same Moments, although one of them have more waight added to it, or its distance changed.

Corollary. When Ponderants are of the same Species, and their Moments be equal; their Magnitudes and Distances from the center of the Scale will be reciprocally proportional. For in Homogeneous Bodies, it is as Waight to Waight, so Magnitude to Magaltude.

8 If to the whole length of the Beam there be applyed a Parallelogram, or a Parallelopipedum, or a Prisma, or a Cylinder, or the Superficies of a Cylinder, ot of a Sphere, or of any portion of a Sphere or Prisma; the parts of any of them cut off with plains parallel to the base, will have their Moments in the same proportion with the parts of a Triangle which has its Vertex in the center of the Scale, and for one of its sides the Beam it self, which parts are cut off by Plains parallel to the base.

First, let the rectangled Parallelogram A B C D (in the 4th figure) be applyed to the whole length of the Beam A B; and producing C B howsoever to E, let the Triangle A B E be described. Let now any part of the Parallelogram, as A F, be cut off by the plain F G, parallel to the base C B; and let F G be produced to A E in the point H. I say the Moment of the whole A B C D to the Moment of its part A F, is as the Triangle A B E to the Triangle A G H, that is, in proportion duplicate to that of the distances from the center of the Scale.

For, the Parallelogram A B C D being divided into equal parts infinite in number, by straight lines drawn parallel to the base; and supposing the Moment of the straight line C B to be B E; the Moment of the straight line F

G, will (by the 7th Article) be G H; and the Moments of all the straight lines of that Parallelogram, will be so many straight lines in the Triangle A B E drawn parallel to the base B E; all which parallels together taken are the Moment of the whole Parallelogram A B C D; and the same parallels do also constitute the superficies of the Triangle A B E. Wherefore the Moment of the Parallelogram A B C D, is the Triangle A B E; and for the same reason, the Moment of the Parallelogram A F, is the Triangle A G H; and therefore the Moment of the whole Parallelogram, to the Moment of a Parallelogram which is part of the same, is as the Triangle A B E, to the Triangle A G H, or in proportion duplicate to that of the Beams to which they are applied. And what is here demonstrated in the case of a Parallelogram, may be understood to serve for that of a Cylinder, and of a Prisma, and their Superficies; as also for the Superficies of a Sphere, of an Hemisphere, or any portion of a Sphere, (for the parts of the Superficies of a Sphere, have the same proportion with that of the parts of the Axis cut off by the same parallels by which the parts of the Superficies are cut off, as Archimedes has demonstrated); and therefore when the parts of any of these figures are equal and at equal distances from the Center of the Scale, their Moments also are equal, in the same manner as they are in Parallelograms.

Secondly, let the Parallelogram A K I B not be rectangled; the straight line I B wil nevertheless press the point B perpendicularly in the straight line B E; & the straight line L G wil press the point G perpendicularly in the straight line G H; and all the rest of the straight lines which are parallel to I B will do the like. Whatsoever therefore the Moment be which is assigned to the straight line I B, as here (for example) it is supposed to be B E, if A E be drawn, the Moment of the whole Parallelogram A I will be the Triangle A B E; and the Moment of the part A L will be the Triangle A G H. Wherefore the Moment of any Ponderant, which has its sides equally applied to the Beam, (whether they be applied perpendicularly or

obliquely) will be always to the Moment of a part of the same, in such proportion, as the whole Triangle has to a part of the same cut off by a plain which is parallel to the base.

9 The Center of Equiponderation of any figure which is deficient according to commensurable proportions of the altitude and base diminished, and whose complete figure is either a Parallelogram, or a Cylinder, or a Parallelopipedum, divides the Axis, so, that the part next the Vertex, to the other part, is as the complete figure to the deficient figure.

For let C I A P E (in the 5th figure) be a deficient figure, whose Axis is A B, and whose complete figure is C D F E; and let the Axis A B be so divided in Z, that A Z be to Z B as C D F E is to C I A P E. I say the center of Equiponderation of the figure C I A P E will be in the point Z.

First, that the Center of Equiponderation of the figure C I A P E is somewhere in the Axis A B, is manifest of it self; and therefore A B is a Diameter of Equiponderation. Let A E be drawn, and let B E be put for the Moment of the straight line C E; the Triangle A B E will therefore (by the 3d Article) be the Moment of the complete figure C D F E. Let the Axis A B be equally divided in L, and let G L H be drawn parallel and equal to the straight line C E, cutting the crooked line C I A P E in I and P, and the straight lines A C and A E in K and M. Moreover, let Z O be drawn parallel to the same C E; and let it be, as L G to L I, so L M to another L N; and let the same be done in all the rest of the straight lines possible, parallel to the base; and through all the points N, let the line A N E be drawn; the three-sided figure A N E B will therefore be the Moment of the figure C I A P E. Now the Triangle A B E is (by the 9th Article of the 17th Chapter) to the three-sided figure A N E B, as A B C D + A I C B is to A I C B twice taken, that is, as C D F E + C I A P E is to C I A P E twice taken. But as C I A P E is to C D F E, that is, as the waight of the deficient figure, is to the waight of the complete figure, so is C I A P E twice taken, to C D F E twice taken.

Wherefore, setting in order $C D F E + C I A P E . 2 C I A P E . 2 C D F E$; the proportion of $C D F E + C I A P E$ to $C D F E$ twice taken, will be compounded of the proportion of $C D F E + C I A P E$ to $C I A P E$ twice taken, that is, of the proportion of the Triangle $A B E$ to the threesided figure $A N E B$, that is, of the Moment of the complete figure to the Moment of the deficient figure, and of the proportion of $C I A P E$ twice taken, to $C D F E$ twice taken, that is, to the proportion reciprocally taken of the waight of the deficient figure to the waight of the complete figure.

Again, seeing by supposition $A Z . Z B :: C D F E . C I A P E$ are proportionals; $A B . A Z :: C D F E + C I A P E . C D F E$ will also (by compounding) be proportionals. And seeing $A L$ is the half of $A B$, $A L . A Z :: C D F E + C I A P E . 2 C D F E$ will also be proportionals. But the proportion of $C D F E + C I A P E$ to $2 C D F E$ is compounded (as was but now shewn) of the proportions of Moment to Moment &c. and therefore the proportion of $A L$ to $A Z$ is compounded of the proportion of the Moment of the complete figure $C D F E$ to the Moment of the deficient figure $C I A P E$, and of the proportion of the waight of the deficient figure $C I A P E$, to the waight of the complete figure $C D F E$; But the proportion of $A L$ to $A Z$ is compounded of the proportions of $A L$ to $B Z$ and of $B Z$ to $A Z$. Now the proportion of $B Z$ to $A Z$ is the proportion of the Waights reciprocally taken, that is to say, of the waight $C I A P E$ to the waight $C D F E$. Therefore the remayning proportion of $A L$ to $B Z$, that is, of $L B$ to $B Z$ is the proportion of the Moment of the waight $C D F E$ to the Moment of the waight $C I A P E$. But the proportion of $A L$ to $B Z$ is compounded of the proportions of $A L$ to $A Z$ and of $A Z$ to $Z B$; of which proportions that of $A Z$ to $Z B$ is the proportion of the waight $C D F E$ to the waight $C I A P E$. Wherefore (by the 5th Article of this Chapter) the remayning proportion of $A L$ to $A Z$ is the proportion of the distances of the points Z and L from the center of the Scale, which is A . And therefore (by the 6th Article) the waight $C I A P E$

shall hang from O in the straight line O Z. So that O Z is one Diameter of Equiponderation of the waight C I A P E. But the straight line A B is the other Diameter of Equiponderation of the same waight C I A P E. Wherefore (by the 7th Definition) the point Z is the center of the same Equiponderation; which point (by construction) divides the axis so, that the part A Z which is the part next the vertex, is to the other part Z B, as the complete figure C D F E is to the deficient figure C I A P E; which is that which was to be demonstrated.

- Corollary. The Center of Equiponderation of any of those plain three-sided figures, which are compared with their complete figures in the Table of the third Article of the 17th Chapter, is to be found in the same Table, by taking the Denominator of the fraction for the part of the axis cut off next the vertex, and the Numerator for the other part next the base. For example, if it be required to find the Center of Equiponderation of the second threesided figure of foure Meanes, there is in the concourse of the second columnne with the row of three-sided figures of four Meanes this fraction $\frac{5}{7}$, which signifies that that figure is to its parallelogram or compleat figure as $\frac{5}{7}$ to Unity, that is, as $\frac{5}{7}$ to $\frac{7}{7}$, or as 5 to 7; and therefore the Center of Equiponderation of that figure, divides the axis, so, that the part next the vertex is to the other part as 7 to 5.
- 2 Corollary. The Center of Equiponderation of any of the Solids of those figures which are contained in the Table of the 8th Article of the same 17th Chapter, is exhibited in the same Table. For example, if the Center of Equiponderation of a Cone be sought for; the Cone will be found to be $\frac{1}{3}$ of its Cylinder; and therefore the Center of its Equiponderation will so divide

the axis, that the part next the vertex, to the other part, will be as 3 to 1. Also the Solid of a three-sided figure of one Meane, that is, a parabolical Solid, seeing it is $\frac{2}{4}$, that is $\frac{1}{2}$ of its Cylinder, will have its Center of Equiponderation in that point, which divides the axis, so, that the part towards the vertex be double to the part towards the base.

10 The Diameter of Equiponderation of the Complement of the half of any of those figures which are contained in the Table of the 3d article of the 17th Chapter, divides that line which is drawne through the Vertex parallel and equall to the base, so, that the part next the Vertex, will be to the other part, as the Complete figure to the Complement.

For let A I C B (in the same 5 fig.) be the halfe of a Parabola, or of any other of those three-sided figures which are in the Table of the 3d article of the 17th Chap whose Axis is A B, and base B C; having A D drawn from the Vertex, equall and parallel to the base B C; and whose complete figure is the parallelogramme A B C D. Let I Q be drawne, at any distance from the side C D, but parallel to it; and let A D be the altitude of the Complement A I C D, and Q I a line ordinately applied in it. Wherefore the altitude A L in the deficient figure A I C B, is equal to Q I the line ordinately applied in its Complement; and contrarily, L I the line ordinately applied in the figure A I C B, is equall to the altitude A Q in its Complement; and so in all the rest of the ordinate lines and altitudes, the mutation is such, that that line which is ordinately applied in the figure, is the altitude of its Complement. And therefore the proportion of the altitudes decreasing, to that of the ordinate lines decreasing, being multiplicate according to any number in the deficient figure, is submultiplicate according to the same number in its Complement. For example, if A I C B be a Parabola, seeing the proportion of A B to A L is duplicate to that of B C to L I, the proportion of A D to A Q in the Complement A I C D (which

is the same with that of B C to L I) will be subduplicate to that of C D to Q I (which is the same with that of A B to A L); and consequently, in a Parabola, the Complement will be to the Parallelogramme as 1 to 3; in a three-sided figure of two Meanes, as 1 to 4; in a three-sided figure of three Meanes, as 1 to 5, &c. But all the ordinate lines together in A I C D are its moment; and all the ordinate lines in A I C B are its moment. Wherefore the moments of the Complements of the halves of Deficient figures in the Table of the 3d article of the 17th Chap. being compared, are as the Deficient figures themselves; and therefore the Diameter of Equiponderation will divide the straight line A D in such proportion, that the part next the Vertex be to the other part, as the complete figure A B C D is to the Complement A I C D.

Coroll. The diameter of Equiponderation of these halves, may be found by the Table of the d article of the 17th Chapter in this manner. Let there be propounded any deficient figure, namely the second three-sided figure of two Meanes. This figure is to the complete figure as $\frac{3}{5}$ to 1, that is as 3 to 5. Wherefore the Complement to the same complete figure is as 2 to 5; and therefore the diameter of Equiponderation of this Complement will cut the straight line drawne from the Vertex parallel to the base, so, that the part next the Vertex will be to the other part as 5 to 2. And in like manner, any other of the said three-sided figures being propounded, if the numerator of its fraction (found out in the Table) be taken from the denominator, the straight line drawn from the Vertex is to be divided, so, that the part next the Vertex be to the other part, as the denominator is to the remainder which that subtraction leaves.

11 The center of Equiponderation of the halfe of any of those crooked-lined figures which are in the first row of the Table of the 3d article of the 17th chapter, is in that straight line, which being parallel to the Axis, divides the base according to the numbers of the fraction next below it in

the second row, so, that the Numerator be answerable to that part which is towards the Axis.

For example, let the first figure of three Means be taken, whose half is A B C D (in the 6th figure), and let the rectangle A B E D be completed. The Complement therefore will be B C D E. And seeing A B E D is to the figure A B C D (by the Table) as 5 to 4, the same A B E D will be to the Complement B C D E as 5 to 1. Wherefore if F G be drawn parallel to the base D A, cutting the axis, so, that A G be to G B as 4 to 5, the center of Equiponderation of the figure A B C D, will (by the precedent article) be somewhere in the same F G. Again, seeing (by the same article) the complete figure A B E D, is to the Complement B C D E as 5 to 1, therefore if B E and A D be divided in H and I as 5 to 1, the center of Equiponderation of the Complement B C D E will be somewhere in the straight line which connects H and I. Let now the straight line L K be drawn through M the center of the complete figure, parallel to the base; and the straight line N O, through the same center M, perpendicular to it; and let the straight lines L K and F G cut the straight line H I in P and Q. Let P R be taken quadruple to P Q; and let R M be drawn and produced to F G in S. R M therefore will be to M S as 4 to 1, that is, as the figure A B C D to its Complement B C D E. Wherefore seeing M is the center of the Complete figure A B E D, and the distances of R and S from the center M be in proportion reciprocally to that of the weight of the Complement B C D E to the weight of the figure A B C D, R and S will either be the centers of Equiponderation of their own figures, or those centers will be in some other points of the diameters of Equiponderation H I and F G. But this last is impossible. For no other straight line can be drawn through the point M terminating in the straight lines H I and F G, and retaining the proportion of M R to M S, that is, of the figure A B C D to its complement B C D E. The center therefore of Equiponderation of the figure A B C D is in the point S.

Now seeing P M hath the same proportion to Q S which R P hath to R Q, Q S will be 5 of those parts of which P M is 4, that is, of which I N is 4. But I N or P M is 2 of those parts of which E B or F G is 6; and therefore if it be, as 4 to 5, so 2 to a fourth, that fourth will be $2\frac{1}{2}$. Wherefore Q S is $2\frac{1}{2}$ of those parts of which F G is 6. But F Q is 1; and therefore F S is $3\frac{1}{2}$. Wherefore the remaying part G S is $2\frac{1}{2}$. So that F G is so divided in S, that the part towards the Axis, is in proportion to the other part as $2\frac{1}{2}$ to $3\frac{1}{2}$, that is, as 5 to 7; which answereth to the fraction $\frac{5}{7}$ in the second row, next under the fraction $\frac{4}{5}$ in the first row. Wherefore drawing S T parallel to the Axis, the base will be divided in like manner.

By this Method it is manifest, that the base of a Semiparabola will be divided into 3 and 5; and the base of the first three-sided figure of two Means, into 4 and 6; and of the first three-sided figure of four Means, into 6 and 8. The fractions therefore of the second row denote the proportions into which the bases of the figures of the first row are divided by the diameters of Equiponderation. But the first row begins one place higher then the second row.

12 The center of Equiponderation of the half of any of the figures in the second row of the same Table of the 3d article of the 17th Chapter, is in a straight line parallel to the Axis, and dividing the base according to the numbers of the fraction in the fourth row, two places lower, so, as that the Numerator be answerable to that part which is next the Axis.

Let the half of the second three-sided figure of two Means be taken; and let it be A B C D (in the 7th Figure); whose complement is B C D E, and the rectangle completed A B E D. Let this rectangle be divided by the two straight lines L K & N O, cutting one another in the center M at right angles; and because A B E D is to A B C D as 5 to 3, let A B be divided in G, so, that A G to B G be as 3 to 5; and let F G be drawn parallel to the base. Also because A B E D is (by the 9th article) to B C D E as 5 to 2, let

B E be divided in the point I, so, that B I be to I E as 5 to 2; and let I H be drawn parallel to the Axis, cutting L K and F G in P and Q. Let now P R be so taken, that it be to P Q as 3 to 2, and let R M be drawn and produced to F G in S. Seeing therefore R P is to R Q, that is, R M to M S, as A B C D is to its complement B C D E, and the centers of Equiponderation of A B C D and B C D E are in the straight lines F G and H I, and the center of Equiponderation of them both together in the point M; R will be the center of the Complement B C D E, and S the center of the Figure A B C D. And seeing P M, that is I N, is to Q S, as R P is to R Q; and I N, or P M is 3 of those parts, of which B E, that is, F G is 14; therefore Q S is 5 of the same parts; and E I, that is F Q, 4; and F S, 9; and G S, 5. Wherefore the straight line S T being drawn parallel to the Axis, will divide the base A D into 5 and 9. But the fraction $\frac{5}{9}$ is found in the fourth row of the Table, two places below the fraction $\frac{9}{5}$ in the second row.

By the same method, if in the same second row, there be taken the second three-sided Figure of three Meanes, the center of Equiponderation of the half of it, will be found to be in a straight line parallel to the Axis, dividing the base according to the numbers of the fraction $\frac{6}{10}$, two places below in the fourth row. And the same way serves for all the rest of the Figures in the second row. In like manner, the center of Equiponderation of the third three-sided Figure of three Means, will be found to be in a straight line parallel to the Axis, dividing the base, so, that the part next the Axis, be to the other part, as 7 to 13, &c.

Coroll. The Centers of Equiponderation of the halves of the said Figures are known, seeing they are in the intersection of the straight lines S T and F G, which are both known.

13 The center of Equiponderation of the half of any of the Figures, which (in the Table of the 3d Article of the 17th Chap.) are compared with

their Parallelograms, being known; the center of Equiponderation of the excess of the same Figure above its triangle, is also known.

For example, let the Semiparabola A B C D (in the 8th Fig.) be taken; whose Axis is A B; whose complete Figure is A B E D; and whose excess above its triangle is B C D B. Its center of Equiponderation may be found out in this manner. Let F G be drawn parallel to the base, so, that A F be a third part of the Axis; and let H I be drawn parallel to the Axis, so, that A H be a third part of the base. This being done, the center of Equiponderation of the triangle A B D, will be I. Again, let K L be drawn parallel to the base, so, that A K be to A B as 2 to 5; and M N parallel to the Axis, so, that A M be to A D as 3 to 8; and let M N terminate in the straight line K L. The center therefore of Equiponderation of the Parabola A B C D is N; and therefore we have the centers of Equiponderation of the Semiparabola A B C D, and of its part the triangle A B D. That we may now finde the Center of Equiponderation of the remaying part B C D B, let I N be drawn and produced to O, so, that N O be triple to I N; and O will be the center sought for. For seeing the waight of A B D, to the waight of B C D B is in proportion reciprocally to that of the straight line N O to the straight line I N; and N is the center of the whole, and I the center of the triangle A B D; O will be the center of the remaining part, namely, of the figure B D C B; which was to be found.

Coroll. The Center of Equiponderation of the figure B D C B, is in the concourse of two straight lines, whereof one is parallel to the base, and divides the Axis, so, that the part next the base be $\frac{2}{5}$ or $\frac{6}{15}$ of the whole Axis; the other is parallel to the Axis, and so divides the base, that the part towards the Axis be $\frac{1}{2}$ or $\frac{12}{24}$ of the whole base. For drawing O P parallel to the base, it will be as I N to N O, so F K to K P, that is, so 1 to 3, or 5 to 15. But A F is $\frac{5}{15}$ or $\frac{1}{3}$ of the whole A B; and A K is $\frac{6}{15}$ or $\frac{2}{5}$; and F K $\frac{1}{15}$; and K P $\frac{3}{15}$; and therefore A P is $\frac{9}{15}$ of the Axis A B. Also A H is $\frac{1}{3}$

or $8/24$; and $A M \frac{3}{8}$ or $9/24$ of the whole base; and therefore $O Q$ being drawn parallel to the Axis, $M Q$ (which is triple to $H M$) will be $3/24$. Wherefore $A Q$ is $12/24$ or $\frac{1}{2}$ of the base $A D$.

The excesses of the rest of the three-sided figures in the first row of the Table of the 3d article of the 17th Chapter, have their centers of Equiponderation in two straight lines which divide the Axis and base according to those fractions, which adde 4 to the numerators of the fractions of a Parabola $9/15$ and $12/24$; and 6 to the denominators, in this manner,

- In a Parabola, The Axis $9/15$, The Base $12/24$
- In the first three-sided figure, The Axis $13/21$, The Base $16/30$
- In the second three-sided figure, The Axis $17/27$, The Base $20/36$ &c.

And by the same method, any man (if it be worth the paines) may find out the centers of Equiponderation of the excesses above their triangles of the rest of the figures in the second & third row, &c.

14 The center of Equiponderation of the Sector of a Sphere (that is, of a figure compounded of a right Cone whose Vertex is the center of the Sphere, and the portion of the Sphere whose base is the same with that of the Cone), divides the straight line which is made of the Axis of the Cone and halfe the Axis of the portion together taken, so, that the part next the Vertex be triple to the other part, or to the whole straight line, as 3 to 4.

For let $A B C$ (in the 9th fig.) be the Sector of a Sphere, whose Vertex is the center of the Sphere A ; whose Axis is $A D$; and the circle upon $B C$ is the common base of the portion of the Sphere and of the Cone whose Vertex is A ; the Axis of which portion is $E D$, and the halfe thereof $F D$; and the Axis of the Cone, $A E$. Lastly let $A G$ be $\frac{3}{4}$ of the straight line $A F$. I say G is the center of Equiponderation of the Sector $A B C$.

Let the straight line $F H$ be drawne of any length, making right angles with $A F$ at F ; and drawing the straight line $A H$, let the triangle $A F H$ be

made. Then upon the same center A let any arch I K be drawne, cutting A D in L; and its chord, cutting A D in M; and dividing M L equally in N, let N O be drawne parallel to the straight line F H, and meeting with the straight line A H in O.

Seeing now B D C is the Spherical Superficies of the portion cut off with a plain passing through B C, and cutting the Axis at right angles; and seeing F H divides E D the Axis of the portion into two equal parts in F; the center of Equiponderation of the Superficies B D C will be in F (by the 8th article); and for the same reason the center of Equiponderation of the Superficies I L K (K being in the straight line A C) will be in N. And in like manner, if there were drawne between the center of the Sphere A and the outermost Spherical Superficies of the Sector, arches infinite in number, the centers of Equiponderation of the Sphericall Superficies in which those arches are,, would be found to be in that part of the Axis, which is intercepted between the Superficies it selfe and a plaine passing along by the chord of the arch, and cutting the Axis in the middle at right angles.

Let it now be supposed that the moment of the outermost sphericall Superficies B D C is F H. Seeing therefore the Superficies B D C is to the Superficies I L K in proportion duplicate to that of the arch B D C to the arch I L K, that is, of B E to I M, that is, of F H to N O; let it be as F H to N O, so N O to another N P; and again, as N O to N P, so N P to another N Q; and let this be done in all the straight lines parallel to the base F H that can possibly be drawn between the base and the vertex of the triangle A F H. If then through all the points Q there be drawn the crooked line A Q H, the figure A F H Q A will be the complement of the first three-sied figure of two Meanes; and the same will also be the moment of all the Sphericall Superficies of which the Solid Sector A B C D is compounded; and by consequent, the moment of the Sector it selfe. Let now F H be understood to be the semidiameter of the base of a right Cone, whose side is A H, and

Axis A F. Wherefore seeing the bases of the Cones which passe through F and N and the rest of the points of the Axis, are in proportion duplicate to that of the straight lines F H and N O, &c. the moment of all the bases together, that is, of the whole Cone, will be the figure it self A F H Q A; and therefore the center of Equiponderation of the Cone A F H is the same with that of the solid Sector. Wherefore seeing A G is $\frac{3}{4}$ of the Axis A F, the center of Equiponderation of the Cone A F H is in G; and therefore the center of the solid Sector is in G also, and divides the part A F of the Axis, so, that A G is triple to G F; that is, A G is to A F as 3 to 4; which was to be demonstrated.

Note, that when the Sector is a Hemisphere, the Axis of the Cone vanisheth into that point which is the center of the Sphere; and therefore it addeth nothing to half the Axis of the portion. Wherefore, if in the Axis of the Hemisphere, there be taken from the center, $\frac{3}{4}$ of halfe the Axis, that is, $\frac{3}{8}$ of the Semidiameter of the Sphere, there will be the center of Equiponderation of the Hemisphere.

CHAP. XXIV. OF REFRACTION AND REFLECTION.

1 DEFINITIONS.

2 In perpendicular Motion there is no Refraction.

3 Things thrown out of a thinner into a thicker Medium, are so refracted, that the Angle Refracted is greater then the Angle of Inclination.

4 Endeavour which from one point tendeth every way, will be so Refracted, at that the sine of the Angle Refracted, will be to the sine of the Angle of Inclination, as the Density of the first Medium is to the Density of the second Medium, reciprocally taken.

5 The sine of the Refracted Angle in one Inclination is to the sine of the Refracted Angle in another Inclination, as the sine of the Angle of that Inclination is to the sine of the Angle of this Inclination.

6 If two lines of Incidence, having equal Inclination, be the one in a thinner, the other in a thicker Medium, the sine of the angle of Inclination will be a Mean proportional between the two sines of the Refracted angles.

7 If the angle of Inclination be semirect, and the line of Inclination be in the thicker Medium, and the proportion of their Densities be the same with that of the Diagonal to the side of a Square, and the separating Superficies be plain, the Refracted line will be in the separating Superficies.

8 If a Body be carried in a straight line upon another Body, and do not penetrate the same, but be reflected from it, the angle of Reflexion will be equal to the Angle of Incidence.

9 The same happens in the generation of Motion in the line of Incidence.

DEFINITIONS.

1 REFRACTION, IS the breaking of that straight Line, in which a Body is moved, or its Action would proceed in one and the same Medium, into two straight lines, by reason of the different natures of the two Mediums.

2 The former of these is called the Line of Incidence; the later the Refracted Line.

3 The Point of Refraction, is the common point of the Line of Incidence and of the Refracted Line.

4 The Refracting Superficies, which also is the Separating Superficies of the two Mediums, is that in which is the point of Refraction.

5 The Angle Refracted, is that which the Refracted Line makes in the point of Refraction, with that Line which from the same point is drawn perpendicular to the separating Superficies in a different Medium.

6 The Angle of Refraction, is that which the Refracted line makes with the Line of Incidence produced.

7 The Angle of Inclination, is that which the Line of Incidence makes with that Line which from the point of Refraction is drawn perpendicular to the separating Superficies.

8 The Angle of Incidence, is the Complement to a right Angle of the Angle of Inclination.

And so, (in the first Figure) the Refraction is made in A B F. The Refracted Line is B F. The Line of Incidence is A B. The Point of Incidence, and of Refraction is B. The Refracting or Separating Superficies is D B E. The Line of Incidence produced directly is A B C The

Perpendicular to the separating Superficies is B H. The Angle of Refraction is C B F. The Angle Refracted is H B F. The Angle of Inclination is A B G or H B C. The Angle of Incidence is A B D.

9 Moreover the Thinner Medium, is understood to be that in which there is less resistance to Motion or to the generation of Motion; & the Thicker, that wherein there is greater resistance.

10 And that Medium in which there is equal resistance every where, is a Homogeneous Medium. All other Mediums are Heterogeneous.

2 If a Body pass, or there be generation of Motion, from one Medium to another of different Density, in a line perpendicular to the Separating Superficies; there will be no Refraction.

For seeing on every side of the perpendicular all things in the Mediums are supposed to be like and equal; if the Motion it self be supposed to be perpendicular, the Inclinations also will be equal, or rather none at all; and therefore there can be no cause, from which Refraction may be inferred to be on one side of the perpendicular, which will not conclude the same Refraction to be on the other side. Which being so, Refraction on one side will destroy Refraction on the other side; and consequently, either the Refracted line will be every where, (which is absurd), or there will be no Refracted line at all; which was to be demonstrated.

Corol. It is manifest from hence, that the cause of Refraction consisteth onely in the obliquity of the line of Incidence, whether the Incident Body penetrate both the Mediums, or without penetrating, propagate motion by Pressure onely.

3 If a Body, without any change of situation of its internal parts, as a stone, be moved obliquely out of the thinner Medium, and proceed penetrating the thicker Medium; and the thicker Medium be such, as that its

internal parts being moved, restore themselves to their former situation; the angle Refracted will be greater then the angle of Inclination.

For let D B E (in the same first figure) be the separating Superficies of two Mediums; and let a Body, as a stone thrown, be understood to be moved as is supposed in the straight line A B C; and let A B be in the thinner Medium, as in the Aire; and B C in the thicker, as in the Water. I say the stone, w^{ch} being thrown, is moved in the line A B, will not proceed in the line B C, but in some other line, namely that, with which the perpendicular B H makes the Refracted angle H B F greater then the angle of Inclination H B C.

For seeing the stone coming from A, and falling upon B, makes that which is at B proceed towards H, and that the like is done in all the straight lines which are parallel to B H; and seeing the parts moved restore themselves by contrary motion in the same line; there will be contrary motion generated in H B, and in all the straight lines which are parallel to it. Wherefore the motion of the stone will be made by the concurrence of the motions in A G, that is, in D B, and in G B, that is, in B H, and lastly, in H B, that is, by the concurrence of three motions. But by the concurrence of the motions in A G and B H, the stone will be carried to C; and therefore by adding the motion in H B, it will be carried higher in some other line, as in B F, and make the angle H B F greater then the angle H B C.

And from hence may be derived the cause, why Bodies which are thrown in a very oblique line, if either they be any thing flat, or be thrown with great force, will when they fall upon the water, be cast up again from the water into the aire.

For let A B (in the 2d figure) be the superficies of the water; into which from the point C, let a stone be thrown in the straight line C A, making with the line B A produced a very little angle C A D; and producing B A indefinitely to D, let C D be drawn perpendicular to it, and A E parallel to C

D. The stone therefore will be moved in C A by the concurrence of two motions in C D and D A, whose velocities are as the lines themselves C D and D A. And from the motion in C D and all its parallels downwards, as soon as the stone falls upon A, there will be Reaction upwards, because the water restores it self to its former situation. If now the stone be thrown with sufficient obliquity, that is, if the straight line C D be short enough, that is, if the endeavour of the stone downwards be less then the Reaction of the water upwards, that is, less then the endeavour it hath from its own gravity, (for that may be), the stone will (by reason of the excess of the endeavour which the water hath to restore it self, above that which the stone hath downwards) be raised again above the Superficies A B, and be carried higher, being reflected in a line which goes higher, as the line A G.

4 If from a point, whatsoever the Medium be, Endeavour be propagated every way into all the parts of that Medium; and to the same Endeavour there be obliquely opposed another Medium of a different nature, that is, either thinner or thicker; that Endeavour will be so refracted, that the sine of the angle Refracted, to the sine of the angle of Inclination, will be as the density of the first Medium to the density of the second Medium, reciprocally taken.

First, let a Body be in the thinner Medium in A (Figure 3d.); and let it be understood to have endeavour every way, and consequently that its endeavour proceed in the lines A B and A b; to which let B b the superficies of the thicker Medium be obliquely opposed in B and b, so that A B and A b be equal; and let the straight line B b be produced both wayes. From the points B and b let the perpendiculars B C and b c be drawn; and upon the centers B and b, and at the equal distances B A and b A, let the Circles A C and A c be described, cutting B C and b c in C and c, and the same C B and c b produced in D and d, as also A B and A b produced in E and e. Then from the point A to the straight lines B C and b c let the perpendiculars A F

and Af be drawn. AF therefore will be the sine of the angle of Inclination of the straight line AB , and Af the sine of the angle of Inclination of the straight line Ah , which two Inclinations are by construction made equal. I say, as the density of the Medium in which are BC and bc , is to the density of the Medium in which are BD and bd , so is the sine of the angle Refracted, to the sine of the angle of Inclination.

Let the straight line FG be drawn parallel to the straight line AB , meeting with the straight line bB produced in G .

Seeing therefore AF and BG are also parallels, they will be equal; and consequently, the endeavour in AF is propagated in the same time, in which the endeavour in BG would be propagated if the Medium were of the same density. But because BG is in a thicker Medium, that is, in a Medium which resists the endeavour more then the Medium in which AF is, the endeavour will be propagated less in BG then in AF , according to the proportion which the density of the Medium in which AF is, hath to the density of the Medium in which BG is. Let therefore the density of the Medium in which BG is, be to the density of the Medium in which AF is, as BG is to BH ; and let the measure of the time be the Radius of the Circle. Let HI be drawn parallel to BD , meeting with the circumference in I ; and from the point I let IK be drawn perpendicular to BD ; which being done, BH and IK will be equal; and IK will be to AF , as the density of the Medium in which is AF , is to the density of the Medium in which is IK . Seeing therefore in the time AB (which is the Radius of the Circle) the endeavour is propagated in AF in the thinner Medium, it will be propagated in the same time, that is, in the time BI in the thicker Medium from K to I . Therefore BI is the Refracted line of the line of Incidence AB ; and IK is the sine of the angle Refracted; and AF , the sine of the angle of Inclination. Wherefore seeing IK is to AF , as the density of the Medium in which is AF to the density of the Medium in which is IK ; it will be as the density of

the Medium in which is A F, (or B C) to the density of the Medium in which is I K (or B D), so the sine of the angle Refracted to the sine of the angle of Inclination. And by the same reason it may be shewn, that as the density of the thinner Medium is to the density of the thicker Medium, so will K I the sine of the angle Refracted be to A F the sine of the Angle of Inclination.

Secondly, let the Body which endeavoureth every way, be in the thicker Medium at I. If therefore both the Mediums were of the same density, the endeavour of the Body in I B would tend directly to L; and the sine of the angle of Inclination L M would be equal to I K or B H. But because the density of the Medium in which is I K, to the density of the Medium in which is L M, is as B H to B G, that is, to A F, the endeavour will be propagated further in the Medium in which L M is, then in the Medium in which I K is, in the proportion of density to density, that is, of M L to A F. Wherefore B A being drawn, the angle Refracted will be C B A, and its sine A F. But L M is the sine of the angle of Inclination; and therefore again, as the density of one Medium is to the density of the different Medium, so reciprocally is the sine of the angle Refracted to the sine of the angle of Inclination, which was to be demonstrated.

In this Demonstration, I have made the separating Superficies B b plain by construction. But though it were concave or convex, the Theoreme would nevertheless be true. For the Refraction being made in the point B of the plain separating Superficies, if a crooked line, as P Q be drawn, touching the separating line in the point B; neither the Refracted line B I, nor the perpendicular B D will be altered; and the Refracted angle K B I, as also its sine K I will be still the same they were.

5 The sine of the angle Refracted in one Inclination, is to the sine of the angle Refracted in another Inclination, as the sine of the angle of that Inclination to the sine of the angle of this Inclination.

For seeing the sine of the Refracted angle is to the sine of the angle of Inclination, (whatsoever that Inclination be) as the density of one Medium, to the density of the other Medium; the proportion of the sine of the Refracted angle, to the sine of the angle of Inclination, will be compounded of the proportions of density to density, and of the sine of the angle of one Inclination to the sine of the angle of the other Inclination. But the proportions of the densities in the same Homogeneous Body, are supposed to be the same. Wherefore Refracted angles in different Inclinations, are as the sines of the angles of those Inclinations; which was to be demonstrated.

6 If two lines of Incidence having equal inclination, be the one in a thinner, the other in a thicker Medium; the sine of the angle of their Inclination, will be a mean proportional between the two sines of their angles Refracted.

For let the straight line AB (in the same 3d figure) have its Inclination in the thinner Medium, and be refracted in the thicker Medium in B I; and let E B have as much Inclination in the thicker Medium, and be refracted in the thinner Medium in B S; and let R S the sine of the angle Refracted be drawn. I say the straight lines R S, A F and I K are in continual proportion. For it is, as the density of the thicker Medium to the density of the thinner Medium, so R S to A F. But it is also, as the density of the same thicker Medium, to that of the same thinner Medium, so AF to IK. Wherefore R S. A F : : A F. I K are propoortionals; that is, R S, A F and I K are in continual proportion, and A F is the Mean proportional; which was to be proved.

7 If the angle of Inclination be semirect, and the line of Inclination be in the thicker Medium, and the proportion of the Densities be as that of a Diagonal to the side of its Square, and the separating Superficies be plain, the Refracted line will be in that separating Superficies.

For in the Circle A C (in the 4th figure) let the angle of Inclination A B C be an angle of 45 degrees. Let C B be produced to the Circumference in

D; & let C E (the sine of the angle B C) be drawn to which, let B F be taken equal in the separating line B G. B C E F will therefore be a Parallelogram, & F E & B C, that is, F E and B G equal. Let A G be drawn, namely, the Diagonal of the Square whose side is B G; and it will be, as A G to E F, so B G to B F; & so (by supposition) the density of the Medium in which C is, to the density of the Medium in which D is; and so also the sine of the angle Refracted to the sine of the angle of Inclination. Drawing therefore F D, & from D the line D H perpendicular to A B produced, D H will be the sine of the angle of Inclination. And seeing the sine of the angle Refracted is to the sine of the angle of Inclination, as the density of the Medium in which is C, is to the density of the Medium in which is D, that is, (by supposition) as A G is to F E, that is, as D H is to B G; and seeing D H is the sine of the angle of Inclination, B G will therefore be the sine of the angle Refracted. Wherefore B G will be the Refracted line, and lye in the plain separating Superficies; which was to be demonstrated.

Coroll. It is therefore manifest, that when the Inclination is greater then 45 degrees, as also when it is less, provided the density be greater, it may happen that the Refraction will not enter the thinner Medium at all.

8 If a Body fall in a straight line upon another Body, and do not penetrate it, but be reflected from it, the angle of Reflexion will be equal to the angle of Incidence.

Let there be a Body at A (in the 5th figure), which falling with straight motion in the line A C upon another Body at C, passeth no further, but is reflected; and let the angle of Incidence be any angle, as A C D. Let the straight line C E be drawn, making with D C produced the angle E C F equall to the angle A C D; and let A D be drawn perpendicular to the straight line D F. Also in the same straight line D F let C G be taken equall to C D; and let the perpendicular G E be raised, cutting C E in E. This being done, the triangles A C D and E C G will be equall and like. Let C H be

drawn equal and parallel to the straight line AD ; and let HC be produced indefinitely to I . Lastly let EA be drawn, which will passe through H , and be parallel and equall to GD . I say the motion from A to C in the straight line of Incidence AC , will be reflected in the straight line CE .

For the motion from A to C is made by two coefficient or concurrent motions, the one in AH parallel to DG , the other in AD perpendicular to the same DG ; of which two motions, that in AH workes nothing upon the Body A after it has been moved as farre as C , because (by supposition) it doth not passe the straight line DG ; whereas the endeavour in AD , that is in HC , worketh further towards I . But seeing it doth onely presse and not penetrate, there will be reaction in H , which causeth motion from C towards H ; and in the mean time the motion in HE remaines the same it was in AH ; and therefore the Body will now be moved by the concourse of two motions in CH and HE , which are equall to the two motions it had formerly in AH and HC . Wherefore it will be carried on in CE . The angle therefore of Reflection will be ECG , equall (by construction) to the angle ACD ; which was to be demonstrated.

Now when the Body is considered but as a point, it is all one, whether the Superficies or line in which the Reflection is made, be straight or crooked; for the point of Incidence and Reflexion C , is as well in the crooked line which toucheth DG in C , as in DG it selfe.

9 But if we suppose that not a Body be moved, but some Endeavour onely be propagated from A to C , the Demonstration will neverthelesse be the same. For all Endeavour is motion; and when it hath reached the Solid Body in C , it presseth it, and endeavoureth further in CI . Wherefore the reaction will proceed in CH ; and the endeavour in CH concurring with the endeavour in HE , will generate the endeavour in CE , in the same manner as in the repercussion of Bodies moved.

If therefore Endeavour be propagated from any point to the concave Superficies of a Spherical Body, the Reflected line with the circumference of a great circle in the same Sphere, will make an angle equall to the angle of Incidence.

For if Endeavour be propagated from A (in the 6 fig.) to the circumference in B, and the center of the Sphere be C, and the line C B be drawne, as also the Tangent D B E; and lastly if the angle F B D be made equall to the angle A B E, the Reflexion will be made in the line B F, as hath been newly shewn. Wherefore the angles which the straight lines A B and F B make with the circumference, will also be equall. But it is here to be noted that if C B be produced howsoever to G, the endeavour in the line G B C will proceed onely from the perpendicular reaction in G B; and that therefore there will be no other endeavour in the point B towards the parts which are within the Sphere, besides that which tends towards the center.

And here I put an end to the third part of this Discourse; in which I have considered Motion and Magnitude by themselves in the abstract. The fourth and last part, concerning the Phaenomena of Nature, that is to say, concerning the Motions and Magnitudes of the Bodies which are parts of the World, reall and existent, is that which followes.

**THE FOURTH PART, OF PHYSIQUES, OR THE
PHAENOMENA OF NATURE.**

CHAP. XXV. OF SENSE AND ANIMAL MOTION.

- 1 THE CONNEXION of what hath been said with that which followeth.
- 2 The investigation of the nature of Sense, and the Definition of Sense.
- 3 The Subject and Object of Sense.
- 4 The Organ of Sense.
- 5 All Bodies are not indued with Sense.
- 6 But one Phantasme at one and the same time.
- 7 Imagination, the Remayns of past Sense, (which also is Memory). Of Sleep.
- 8 How Phantasmes succeed one another.
- 9 Dreames, whence they proceed.
- 10 Of the Senses, their kindes, their Organs, and Phantasmes proper and common.
- 11 The Magnitude of Images, how and by what it is determined.
- 12 Pleasure, Pain, Appetite, and Aversion, what they are.
- 13 Deliberation and Will, what.

1 I Have (in the first Chapter) defined Philosophy to be Knowledge of Effects acquired by true Ratiocination, from knowledge first had of their

Causes and Generation; and of such Causes or Generations as may be, from former knowledge of their Effects or Appearances. There are therefore two Methods of Philosophy, One from the Generation of things to their possible Effects, and the other from their Effects or Appearances to some possible Generation of the same. In the former of these, the Truth of the first Principles of our ratiocination (namely Definitions) is made and constituted by our selves, whilst we consent and agree about the Appellations of things. And this part I have finished in the foregoing Chapters; in which (if I am not deceived) I have affirmed nothing (saving the Definitions themselves) which hath not good coherence with the Definitions I have given; that is to say, which is not sufficiently demonstrated to all those that agree with me in the use of Words and Appellations; for whose sake onely I have written the same. I now enter upon the other part; which is the finding out by the Appearances or Effects of Nature which we know by Sense, some wayes and means by which they may be (I do not say, they are) generated. The Principles therefore, upon which the following discourse depends, are not such as we our selves make and pronounce in general terms, as Definitions; but such, as being placed in the things themselves by the Authour of Nature, are by us observed in them; and we make use of them in single and particular, not universal propositions. Nor do they impose upon us any necessity of constituting Theoremes; their use being onely (though not without such general Propositions as have been already demonstrated) to shew us the possibility of some production or generation. Seeing therefore the Science which is here taught, hath its Principles in the Appearances of Nature, and endeth in the attayning of some knowledge of Natural causes, I have given to this Part, the title of PHYSIQUES, or the PHAENOMENA of NATURE. Now such things as appear, or are shewn to us by Nature, we call Phaenomena or Appearances.

Of all the Phaenomena, or Appearances which are neer us, the most admirable is Apparition it self, ; namely, that some Natural Bodies have in themselves the patterns almost of all things, and others of none at all. So that if the Appearances be the Principles by which we know all other things, we must needs acknowledge Sense to be the Principle by which we know those Principles; & that all the knowledge we have is derived from it. And as for the causes of Sense, we cannot begin our search of them from any other Phaenomenon then that of Sense it self. But you will say, by what Sense shall we take notice of Sense? I answer, by Sense it self, namely, by the Memory which for some time remains in us of things sensible, though they themselves pass away. For he that perceives that he hath perceived, remembers.

In the first place therefore the causes of our Perception, that is, the causes of those Ideas and Phantasmes which are perpetually generated within us whilst we make use of our Senses, are to be enquired into; and in what manner their generation proceeds. To help which Inquisition, we may observe first of all, that our Phantasmes or Ideas are not alwayes the same; but that new ones appear to us, and old ones vanish, according as we apply our Organs of Sense, now to one Object, now to another. Wherefore they are generated, and perish. And from hence it is manifest, that they are some change or mutation in the Sentient.

2 Now that all Mutation or Alteration is Motion, or Endeavour (and Endeavour also is Motion) in the internal parts of the thing that is altered, hath been proved (in the 9th Article of the 8th Chapter) from this, that whilst even the least parts of any Body remain in the same situation in respect of one another, it cannot be said that any alteration (unless perhaps that the whole Body together hath been moved) hath hapned to it; but that it both appeareth and is the same it appeared & was before. Sense therefore in the Sentient, can be nothing else but motion in some of the internal parts of

the Sentient; and the parts so moved, are parts of the Organs of Sense. For the parts of our Body by which we perceive any thing, are those we commonly call the Organs of Sense. And so we find what is the Subject of our Sense, namely, that in which are the Phantasmes; and partly also we have discovered the nature of Sense, namely, that it is some internal Motion in the Sentient.

I have shewn besides (in the 8th Chap. at the 7th Article) that no Motion is generated but by a Body contiguous and Moved. From whence it is manifest, that the immediate cause of Sense or Perception consists in this, that the first Organ of Sense is touched and pressed. For when the uttermost part of the Organ is pressed, it no sooner yeilds, but the part next within it, is pressed also; and in this manner, the pressure or Motion is propagated through all the parts of the Organ to the innermost. And thus also the pressure of the uttermost part proceeds from the pressure of some more remote Body, and so continually, till we come to that from which, as from its fountain we derive the Phantasme or Idea that is made in us by our Sense. And this, whatsoever it be, is that we commonly call the Object. Sense therefore is some internal Motion in the Sentient, generated by some internal Motion of the parts of the Object, and propagated through all the Media to the innermost part of the Organ. By which words I have almost defined what Sense is.

Moreover, I have shewn (in the 2d Article of the 15 Chapter) that all Resistance is Endeavour opposite to another Endeavour, that is to say, Reaction. Seeing therefore there is in the whole Organ by reason of its own internal natural Motion; some Resistance or Reaction against the Motion which is propagated from the Object to the innermost part of the Organ, there is also in the same Organ an Endeavour opposite to the Endeavour which proceeds from the Object; so that when that Endeavour inwards is the last action in the act of Sense, then from the Reaction, how little soever the

duration of it be, a Phantasme or Idea hath its being; which by reason the Endeavour is now outwards, doth alwayes appear as something situate without the Organ. So that now I shall give you the whole Definition of Sense, as it is drawn from the explication of the causes thereof, and the order of its generation, thus; SENSE is a Phantasme, made by the Reaction and endeavour outwards in the Organ of Sense, caused by an Endeavour inwards from the Object, remayning for some time more or less.

3 The Subject of Sense, is the Sentient it self, namely, some living Creature; and we speak more correctly, when we say a Living Creature seeth, then when we say the Eye seeth. The Object, is the thing Perceived; and it is more accurately said, that we see the Sun, then that we see the Light. For Light & Colour & Heat & Sound, and other qualities which are commonly called Sensible, are not Objects, but Phantasms in the Sentients. For a Phantasm is the act of Sense, and differs no otherwise from Sense then fieri (that is, Being a doing) differs from Factum esse, (that is, Being done;) which difference, in things that are done in an Instant, is none at all; and a Phantasme is made in an Instant. For in all Motion which proceeds by perpetual propagation, the first part being moved moves the second, the second the third, and so on to the last, and that to any distance how great soever. And in what point of time the first or formost part proceeded to the place of the second, which is thrust on; in the same point of time the last save one proceeded into the place of the last yeilding part; which by reaction, in the same instant, if the reaction be strong enough, makes a Phantasme; and a Phantasme being made, Perception is made together with it,

4 The Organs of Sense, which are in the Sentient, are such parts thereof, that if they be hurt, the very generation of Phantasmes is thereby destroyed, though all the rest of the parts remain intire. Now these parts in the most of Living Creatures are found to be certain Spirits and Membranes, which

proceeding from the Pia Mater, involve the Brain and all the Nerves; also the Brain it self, and the Arteries which are in the Brain; and such other parts, as being stirred, the Heart also, which is the fountain of all Sense is stirred together with them. For whensoever the action of the Object reacheth the Body of the Sentient, that action is by some Nerve propagated to the Brain; and if the Nerve leading thither be so hurt or obstructed, that the Motion can be propagated no further, no Sense follows. Also if the motion be intercepted between the Brain and the Heart by the defect of the Organ by which the action is propagated, there will be no perception of the Object.

5 But though all Sense, as I have said, be made by Reaction, nevertheless it is not necessary that every thing that Reacteth should have Sense. I know there have been Philosophers, & those learned men, who have maintained that all Bodies are endued with Sense. Nor do I see how they can be refuted, if the nature of Sense be placed in Reaction onely. And, though by the Reaction of Bodies inanimate a Phantasme might be made, it would nevertheless cease, as soon as ever the Object were removed. For unless those Bodies had Organs, (as living Creatures have) fit for the retaining of such Motion as is made in them, their Sense would be such, as that they should never remember the same. And therefore this hath nothing to do with that Sense which is the subject of my discourse. For by Sense we commonly understand the judgement we make of Objects by their Phantasmes; namely, by comparing and distinguishing those Phantasmes; which we could never do, if that motion in the Organ, by which the Phantasme is made, did not remain there for some time, and make the same Phantasme return. Wherefore Sense, as I here understand it, and which is commonly so called, hath necessarily some memory adhering to it, by which former and later Phantasmes may be compared together, and distinguished from one another.

Sense therefore properly so called, must necessarily have in it a perpetual variety of Phantasmes, that they may be discerned one from

another. For if we should suppose a man to be made with cleer Eyes, and all the rest of his Organs of Sight well disposed, but endued with no other Sense; and that he should look onely upon one thing, which is alwayes of the same colour and figure without the least appearance of variety, he would seem to me, whatsoever others may say, to see, no more then I seem to my self to feel the Bones of my own Limbs by my Organs of Feeling; and yet those Bones are alwayes, and on all sides touched by a most sensible Membrane. I might perhaps say he were astonished, and looked upon it; but I should not say he saw it; it being almost all one for a man to be alwayes sensible of one and the same thing, and not to be sensible at all of any thing.

6 And yet such is the nature of Sense, that it does not permit a man to discern many things at once. For seeing the nature of Sense consists in Motion; as long as the Organs are employed about one Object, they cannot be so Moved by another at the same time, as to make by both their Motions one sincere Phantasme of each of them at once. And therefore two several Phantasmes will not be made by two Objects working together, but onely one Phantasme compounded from the action of both.

Besides, as when we divide a Body, we divide its place; and when we reckon many Bodies, we must necessarily reckon as many places; and contrarily, as I have shewn in the first Article of the 7th Chapter; so what number soever we say there be of Times, we must understand the same number of Motions also; and as oft as we count many Motions, so oft we reckon many times. For though the object we looke upon be of diverse colours, yet with those diverse colours it is but one varied Object, and not variety of Objects.

Moreover, whilst those Organs which are common to all the Senses (such as are those parts of every Organ which proceed (in Men) from the root of the Nerves, to the Hart) are vehemently stirred by a strong action from some one Object, they are (by reaof the contumacy which the motion

they have already gives them against the reception of all other motion) made the lesse fit to receive any other impression from whatsoever other Objects, to what sense soever those Objects belong. And hence it is, that an earnest studying of one Object, takes away the Sense of all other Objects for the present. For Study is nothing else but a possession of the mind, that is to say, a vehement motion made by some one Object in the Organs of Sense, which are stupid to all other motions as long as this lasteth; according to what was said by Terence, *Populus studio stupidus in funambulo animum occuparat*. For what is Stupor but that which the Greekes call *Stupor*, that is, a cessation from the Sense of other things? Wherefore at one and the same time, we cannot by Sense perceive more then one single Object; as in reading, we see the letters successively one by one, and not all together, though the whole Page be presented to our eye; and though every severall letter be distinctly written there, yet when we looke upon the whole page at once, we read nothing.

From hence it is manifest, that every endeavour of the Organ utwards, is not to be called Sense, but that onely which at severall times is by Vehemence made stronger and more praedominant than the rest; which deprives us of the Sense of other Phantasmes, no otherwise then the Sun deprives the rest of the starres of light, not by hindering their action, but by obscuring and hiding them with his excesse of brightnesse.

7. But the motion of the Organ, by which a Phantasme is made, is not commonly called Sense, except the Object be present. And the Phantasme remaining after the Object is removed or past by, is called Fancy, and in latine *Imaginatio*; which word (because all Phantasmes are not Images) doth not fully answer the signification of the word Fancy in its generall acceptation. Neverthelesse I may use it safely enough, by understanding it for the Greek *Phantasia*.

IMAGINATION therefore is nothing else but Sense decaying, or weakned, by the absence of the Object. But what may be the cause of this decay or weakning? Is the Motion the weaker because the Object is taken away? If it were, then Phantasmes would alwayes and necessarily be less cleare in the Imagination, then they are in Sense; which is not true. For in Dreams (which are the Imaginations of those that sleep) they are no less clear then in Sense it self. But the reason why in men Waking the Phantasms of things past are more obscure then those of things present, is this, that their Organs being at the same time moved by other present Objects, those Phantasmes are the lesse praedominant. Whereas in Sleep, the passages being shut up, externall action doth not at all disturbe or hinder internall motion.

If this be true, the next thing to be considered, will be, whether any cause may be found out, from the supposition whereof it will follow, that the passage is shut up from the externall Objects of Sense to the internall Organ. I suppose therefore, that by the continuall action of Objects, (to which a Reaction of the Organ, and more especially of the Spirits, is necessarily consequent) the Organ is wearied, that is, its parts are no longer moved by the Spirits without some pain; and consequently the Nerves being abandoned and grown slack, they retire to their fountain which is the cavity either of the Brain or of the Heart; by which means the action which proceeded by the Nerves is necessarily intercepted For Action, upon a Patient that retires from it, makes but little Impression at the first; and at last, when the Nerves are by little and little slacked, none at all. And therefore there is no more Reaction, that is, no more Sense, till the Organ being refreshed by Rest, and by a supply of new Spirits recovering strength and motion, the Sentient awaketh. And thus it seems to be alwayes, unless some other praeternatural cause intervene; as Heat in the internal parts from

lassitude, or from some disease stirring the Spirits and other parts of the Organ in some extraordinary manner.

8 Now it is not without cause, nor so casual a thing as many perhaps think it, that Phantasmes in this their great variety, proceed from one another; and that the same Phantasmes sometimes bring into the mind other Phantasmes like themselves, and at other times extreemly unlike. For in the motion of any continued Body, one part followes another by cohaesion; and therefore, whilst we turne our Eies and other Organs successively to many Objects, the motion which was made by every one of them remayning, the Phantasmes are renewed as often as any of those motions comes to be praedominant above the rest; and they become praedominant in the same order, in which at any time formerly they were generated by Sense. So that when by length of time very many Phantasmes have been generated within us by Sense, then almost any thought may arise from any other thought; in so much that it may seeme to be a thing indifferent and casuall, which thought shall follow which. But for the most part this is not so uncertain a thing to waking as to sleeping men. For the thought or Phantasme of the desired End, brings in all the Phantasmes that are meanes conducing to that end, and that in order backwards from the last to the first, and againe forwards from the beginning to the End: But this supposes both Appetite, and Judgement to discern what meanes conduce to the end; which is gotten by Experience; and Experience is store of Phantasmes, arising from the sense of very many things. For and Meminisse, Fancy and Memory differ onely in this, that Memory supposeth the time past, which Fancy doth not. In Memory, the Phantasmes we consider are as if they were worne out with time; but in our Fancy we consider them as they are; which distinction is not of the things themselves, but of the considerations of the Sentient. For there is in Memory, something like that which happens in looking upon things at a great distance; in which, as the small parts of the Object are not

discerned by reason of their remotenesse; so in Memory, many accidents and places and parts of things, which were formerly perceived by Sense, are by length of time decayed and lost.

The perpetuall arising of Phantasmes, both in Sense and Imagination, is that which we commonly call Discourse of the Mind, and is common to men with other living Creatures. For he that thinketh, compareth the Phantasmes that passe, that is, taketh notice of their likenesse or unlikenesse to one another. And as he that observes readily the likenesses of things of different natures, or that are very remote from one another, is said to have a good Fancy; so he is said to have a good Judgement, that finds out the unlikenesses or differences of things that are like one another. Now this observation of differences, is not perception made by a common Organ of Sense, distinct from Sense or Perception properly so called; but is Memory of the differences of particular Phantasmes remaining for some time; as the distinction between Hot and Lucid, is nothing else but the Memory both of a Heating, and of an Enlightning Object.

9 The Phantasmes of men that sleep, are DREAMS. Concerning which we are taught by experience these five things. First, that for the most part there is neither order nor coherence in them. Secondly, that we dream of nothing but what is compounded and made up of the Phantasmes of Sense past. Thirdly, that sometimes they proceed (as in those that are drowsy) from the interruption of their Phantasmes by little and little broken and altered through sleepiness; and sometimes also they begin in the midst of sleep. Fourthly, that they are clearer then the Imaginations of waking men, except such as are made by Sense itself, to which they are equal in clearness. Fifthly, that when we dream, we admire neither the places nor the looks of the things that appear to us. Now from what hath been said, it is not hard to shew what may be the causes of these Phaenomena. For as for the first, seeing all Order and Coherence proceeds from frequent looking back to the

End, that is, from Consultation; it must needs be, that seeing in sleep we lose all thought of the End, our Phantasmes succeed one another, not in that order which tends to any End, but as it hapneth, and in such manner, as Objects present themselves to our Eyes when we look indifferently upon all things before us, and see them, not because we would see them, but because we do not shut our Eyes; for then they appear to us without any order at all. The second proceeds from this, that in the silence of Sense, there is no new motion from the Objects, and therefore no new Phantasme, unless we call that new, which is compounded of old ones, as a Chimaera, a golden Mountain, and the like. As for the third, why a Dream is sometimes as it were the continuation of Sense, made up of broken Phantasmes, as in men distempered with sickness, the reason is manifestly this, that in some of the Organs Sense remains, and in others it faileth. But how some Phantasmes may be revived, when all the exterior Organs are benumbed with sleep, is not so easily shewn. Nevertheless, that which hath already been said, contains the reason of this also. For whatsoever strikes the Pia Mater, reviveth some of those Phantasmes that are still in motion in the Brain; and when any internal motion of the Heart reacheth that Membrane, then the predominant motion in the Brain makes the Phantasme. Now the Motions of the Heart are Appetites and Aversions, of which I shall presently speak further. And as Appetites and Aversions are generated by Phantasmes, so reciprocally Phantasmes are generated by Appetites and Aversions. For example, Heat in the Heart proceeds from Anger and Fighting; and again from Heat in the Heart, (whatsoever be the cause of it) is generated Anger, and the Image of an Enemy in Sleep. And as Love and Beauty stirre up heat in certain Organs; so Heat in the same Organs, from whatsoever it proceeds, often causeth Desire, and the Image of an unresisting Beauty. Lastly, Cold doth in the same manner generate Feare in those that sleep, and causeth them to dream of Ghosts, and to have Phantasmes of horreur and danger; as

Fear also causeth Cold in those that wake; so reciprocal are the motions of the Heart and Brain. The fourth, namely, that the things we seem to see and feel in sleep, are as clear as in sense it self, proceeds from two causes; one, that having then no sense of things without us, that internal motion which makes the Phantasme, in the absence of all other impressions, is praedominant; and the other, that the parts of our Phantasms which are decayed and worn out by time, are made up with other fictitious parts. To conclude, when we dream, we do not wonder at strange places, and the appearances of things unknown to us, because Admiration requires that the things appearing be new and unusual, which can happen to none but those that remember former appearances; whereas in sleep, all things appear as present.

But it is here to be observed, that certain Dreams, especially such as some men have when they are between sleeping and waking, and such as happen to those that have no knowledge of the nature of Dreams, and are with all superstitious, were not heretofore, nor are now accounted Dreams. For the Apparitions men thought they saw, and the Voices they thought they heard in sleep, were not believed to be Phantasmes, but things subsisting of themselves, and Objects without those that dreamed. For to some men, as well sleeping as waking, but especially to guilty men, and in the night, and in hallowed places, Feare alone, helped a little with the stories of such Apparitions, hath raised in their minds terrible Phantasmes, which have been, and are still deceitfully received for things really true, under the names of Ghosts and Incorporeal Substances.

10 In most living Creatures there are observed five kinds of Senses, which are distinguished by their Organs, and by their different kinds of Phantasmes; namely, Sight, Hearing, Smell, Tast and Touch; and these have their Organs partly peculiar to each of them severally, and partly common to them all. The Organ of Sight is partly animate, and partly inanimate. The

inanimate parts, are the three Humours; namely, the Watry Humour, which by the interposition of the Membrane called Uea, (the perforation whereof is called the Apple of the Eye) is contained on one side by the first concave superficies of the Eye, and on the other side by the Ciliary processes and the Coat of the Cristalline humour; the Cristalline, which (hanging in the midst between the Ciliary processes, and being almost of Spherical figure, and of a thick consistence) is inclosed on all sides with its own transparent Coat; and the Vitreous or Glassie Humour, which filleth all the rest of the Cavity of the Eye, and is somewhat thicker then the Watry Humour, but thinner then the Cristalline. The animate part of the Organ is, first, the Membrane Choroeides, which is a part of the Pia Mater, saving that it is covered with a Coat derived from the marrow of the Optique Nerve, which is called the Retina; and this Choroeides, seeing it is part of the Pia Mater, is continued to the beginning of the Medulla Spinalis within the Scull, in which all the Nerves which are within the Head have their roots. Wherefore all the Animal Spirits that the Nerves receive, enter into them there, for it is not imaginable that they can enter into them any where else. Seeing therefore Sense is nothing else but the action of Objects propagated to the furthest part of the Organ; and seeing also that Animal Spirits are nothing but Vital Spirits purified by the Hart and carried from it by the Arteries; it follows necessarily, that the action is derived from the Heart by some of the Arteries to the roots of the Nerves which are in the Head, whether those Arteries be the Plexus Retiformis, or whether they be other Arteries which are inserted into the substance of the Brain. And therefore those Arteries are the Complement, or the remaying part of the whole Organ of Sight. And this last part is a common Organ to all the Senses; whereas that which reacheth from the Eye to the roots of the Nerves is proper onely to Sight. The proper Organ of Hearing is the Tympanum of the Eare, and its own Nerve; from which to the Heart the Organ is Common. So the proper Organs of Smell &

Tast are Nervous Membranes, in the Palate and Tongue for the Taste, and in the Nostrils for the Smell; and from the roots of those Nerves to the Heart all is common. Lastly, the proper Organ of Touch are Nerves and Membranes dispersed through the whole Body; which Membranes are derived from the root of the Nerves. And all things else belonging alike to all the Senses seem to be administred by the Arteries, and not by the Nerves.

The proper Phantasme of Sight is Light; and under this name of Light, Colour also (which is nothing but perturbed Light) is comprehended. Wherefore the Phantasme of a Lucid Body, is Light; and of a coloured Body, Colour. But the Object of Sight, properly so called is neither Light nor Colour, but the Body itself which is lucid, or enlightned, or coloured. For Light and Colour being Phantasmes of the Sentient, cannot be Accidents of the Object. Which is manifest enough from this, that Visible things appear oftentimes in places, in which we know assuredly they are not, and that in different places they are of different colours, and may at one and the same time appear in divers places. Motion, Rest, Magnitude and Figure are common both to the Sight and Touch; and the whole appearance together of Figure, and Light or Colour, is by the Greeks commonly called and by the Latines, Species and Imago; all which names signifie no more but Appearance.

The phantasme which is made by Hearing, is Sound; by Smell, Odour; by Tast, Savour; and by Touch, Hardness and Softness, Heat and Cold, Wetness, Oiliness, and many more, which are easier to be distinguished by sense then words. Smoothness, Roughness, Rarity and Density refer to Figure, and are therefore common both to Touch and Sight. And as for the Objects of Hearing, Smel, Tast, and Touch, they are not Sound, Odour, Savour, Hardness, &c. but the Bodies themselves from which Sound,

Odour, Savour, Hardness, &c. proceed; Of the causes of which, and of the manner how they are produced, I shall speak hereafter.

But these Phantasmes, though they be effects in the Sentient, (as Subject) produced by Objects working upon the Organs; yet there are also other effects besides these, produced by the same Objects, in the same Organs; namely, certain Motions proceeding from Sense, which are called Animal Motions. For seeing in all Sense of external things, there is mutual Action and Reaction, that is, two Endeavours opposing one another, it is manifest, that the motion of both of them together will be continued every way, especially to the confines of both the Bodies. And when this happens in the internal Organ, the Endeavour outwards will proceed in a solid Angle, which will be greater, and consequently the Idea greater, then it would have been if the impression had been weaker.

11 From hence the Natural cause is manifest, First, why those things seem to be greater, which (*caeteris paribus*) are seen in a greater Angle. Secondly, why in a serene cold night when the Moon doth not shine, more of the fixed Stars appear, then at another time. For their action is less hindred by the serenity of the Aire, and not obscured by the greater Light of the Moon, which is then absent; and the Cold making the Air more pressing, helpeth or strengtheneth the action of the Stars upon our Eies, in so much as Stars may then be seen which are seen at no other time. And this may suffice to be said in general concerning Sense made by the Reaction of the Organ. For, as for the place of the Image, the deceptions of Sight, and other things of which we have experience in our selves by Sense, being they depend for the most part upon the Fabrick it self of the Eie of Man, I shall speak of them then when I come to speak of Man.

12 But, there is another kind of Sense, of which I will say something in this place, namely, the Sense of Pleasure and Pain, proceeding, not from the Reaction of the Heart outwards, but from continual action from the

outermost part of the Organ towards the Heart. For the original of Life being in the Heart, that motion in the Sentient which is propagated to the Heart, must necessarily make some alteration or diversion of Vital Motion, namely, by quickning or slackening, helping or hindering the same. Now when it helpeth, it is Pleasure, and when it hindereth, it is Pain, Trouble, Grief, &c. And as Phantasmes seem to be without, by reason of the Endeavour outwards; so Pleasure and Pain by reason of the Endeavour of the Organ inwards seem to be within, namely, there where the first Cause of the Pleasure or Pain is; as when the Pain proceeds from a Wound, we think the Pain and the Wound are both in the same place.

Now Vital Motion, is the Motion of the Bloud, perpetually circulating (as hath been shewn from many infallible signes and marks by Doctor Harvey, the first Observer of it) in the Veins and Arteries. Which Motion, when it is hindered by some other Motion made by the action of sensible Objects, may be restored again either by bending or setting straight the parts of the Body; which is done when the Spirits are carried now into these, now into other Nerves, till the Pain (as farre as is possible) be quite taken away. But if Vital Motion be helped by Motion made by Sense, then the parts of the Organ will be disposed to guide the Spirits in such manner, as conduceth most to the preservation and augmentation of that motion by the help of the Nerves. And in animal motion this is the very first Endeavour, and found even in the Embrio; which while it is in the wombe, moveth its limbes with voluntary motion, for the avoiding of whatsoever troubleth it, or for the pursuing of what pleaseth it. And this first Endeavour, when it tends towards such things as are known by experience to be pleasant, is called APPETITE, (that is, an Approaching;) and when it shuns what is troublesome, AVERSION, or Flying from it. And little Infants, at the beginning, and as soon as they are born, have appetite to very few things, as also they avoid very few, by reason of their want of Experience and Memory; & therefore they have not

so great a variety of animal Motion as we see in those that are more grown. For it is not possible, without such knowledge as is derived from Sense, that is, without Experience and Memory, to know what will prove pleasant, or hurtful; onely there is some place for conjecture from the looks or aspects of things. And hence it is, that though they do not know what may do them good or harm, yet sometimes they approach, and sometimes retire from the same thing as their doubt prompts them. But afterwards by accustoming themselves by little and little, they come to know readily what is to be pursued, and what to be avoided; and also to have a ready use of their Nerves and other Organs in the pursuing and avoiding of good and bad. Wherefore Appetite and Aversion are the first Endeavours of Animal Motion.

Consequent to this first Endeavour, is the Impulsion into the Nerves, and Retraction again of Animal Spirits, of which it is necessary there be some Receptacle on place neer the original of the Nerves; and this Motion or Endeavour is followed by a swelling and Relaxation of the Muscles; and lastly, these are followed by Contraction and Extension of the limbes, which is Animal Motion.

13 The Considerations of Appetites and Aversions are divers. For seeing Living Creatures have sometimes Appetite, and sometimes Aversion to the same thing, as they think it will either be for their good or their hurt, while that vicissitude of Appetites and Aversions remains in them they have that series of Thoughts which is called DELIBERATION; which lasteth as long as they have it in their power to obtain that which pleaseth, or to avoid that which displeaseth them. Appetite therefore and Aversion are simply so called as long as they follow not Deliberation. But if Deliberation have gone before, then the last act of it, if it be Appetite, is called WILL; if Aversion, UNWILLINGNESSE; so that the same thing is called both Will and Appetite; but the consideration of them (namely, before and after

Deliberation) is divers. Nor is that which is done within a Man whilst he Willeth any thing, different from that which is done in other living Creatures, whilst (Deliberation having preceded) they have Appetite.

Neither is the freedome of Willing, or not willing, greater in Man, then in other living Creatures. For where there is Appetite, the entire cause of Appetite hath preceded; and consequently the act of Appetite could not choose but follow, that is, hath of necessity followed, (as is shewn Chapt. 9th Article 5.) And therefore such a Liberty as is free from Necessity, is not to be found in the Will either of Men or Beasts. But if by Liberty we understand the faculty or power, not of Willing, but of Doing what they Will, then certainly that Liberty is to be allowed to both; and both may equally have it, whensoever it is to be had.

Again, when Appetite and Aversion do with celerity succeed one another, the whole series made by them, hath its name sometimes from one, sometimes from the other. For the same Deliberation (whilst it inclines sometimes to one, sometimes to the other) is from Appetite called HOPE, and from Aversion FEAR. For where there is no Hope, it is not to be called Fear, but HATE; and where no Fear, not Hope, but DESIRE. To conclude, all the Passions, called Passions of the Minde, consist of Appetite and Aversion (except pure Pleasure and Pain, which are a certain Fruition of good or Evil;) as Anger, is Aversion from some imminent evil, but such as is joyned with Appetite of avoiding that evil by force. But because the Passions and Perturbations of the Minde are innumerable; and many of them not to be discerned in any Creatures besides Men; I will speak of them more at large in that Section which is concerning Man. As for those Objects (if there be any such) which do not at all stir the Mind, we are said to Contemn them.

And thus much of Sense in general. In the next place I shall speak of Sensible Objects.

CHAP. XXVI. OF THE WORLD, AND OF THE STARRES.

1 THE MAGNITUDE and Duration of the World, inscrutable.

2 No place in the World Empty.

3 The arguments of Lucretius for Vacuum, invalid.

4 Other arguments for the establishing of Vacuum, invalid.

5 Six suppositions for the salving of the Phaenomena of Nature.

6 Possible causes of the Motions Annual and Diurnal; and of the apparent Direction, Station and Retrogradation of the Planets.

7 The supposition of Simple Motion, why likely.

8 The cause of the Excentricity of the annual motion of the Earth.

9 The cause why the Moon hath always one and the same face turned towards the Earth.

10 The cause of the Tides of the Ocean.

11 The cause of the Praecession of the Equinoxes.

1 CONSEQUENT to the Contemplation of Sense is the contemplation of Bodies, which are the efficient causes or Objects of Sense. Now every Object is either a part of the whole World, or an Aggregate of parts. The greatest of all Bodies, or sensible Objects, is the World it self, which we behold when we look round about us from this point of the same which we

call the Earth. Concerning the World, as it is one Aggregate of many parts, the things that fall under inquiry are but few; and those we can determine, none. Of the whole World we may inquire what is its Magnitude, what its Duration, and how many there be; but nothing else. For as for Place and Time, that is to say, Magnitude and Duration, they are only our own fancies of a Body simply so called, that is to say of a Body indefinitely taken, as I have shewne before in the 7 chapter. All other Phantasmes, are of Bodies or Objects as they are distinguished from one another; as Colour, the Phantasme of coloured Bodies; Sound, of Bodies that move the Sense of Hearing, &c. The questions concerning the Magnitude of the World, are, whether it be Finite or Infinite, Full or not Full; Concerning its Duration, whether it had a Beginning, or be Eternall; and concerning the number, whether there be One or Many (though as concerning the Number, if it were of infinite Magnitude, there could be no controversy at all.) Also if it had a beginning, then by what Cause and of what Matter it was made; and againe, from whence that Cause and that Matter had their being, will be new questions; till at last we come to one or many eternall Cause or Causes. And the determination of all these things belongeth to him that professeth the universal doctrine of Philosophy, in case as much could be known as can be sought. But the knowledge of what is Infinite can never be attained by a finite Inquirer. Whatsoever we know that are Men, we learn it from our Phantasmes; and of Infinite (whether Magnitude or Time) there is no Phantasme at all; so that it is impossible either for a man, or any other creature to have any conception of Infinite. And though a man may from some Effect proceed to the immediate Cause thereof, & from that to a more remote Cause, and so ascend continually by right ratiocination from Cause to Cause; yet he will not be able to proceed eternally; but wearied, will at last give over, without knowing whether it were possible for him to proceed to an end, or not. But whether we suppose the World to be Finite, or

Infinite, no absurdity will follow. For the same things which now appear, might appear, whether the Creator had pleased it should be Finite or Infinite. Besides, though from this, that nothing can move it self, it may rightly be inferred that there was some first eternal Movent; yet it can never be inferred (though some use to make such inference) that that Movent was eternally Immoveable, but rather eternally Moved. For as it is true, that nothing is moved by it self; so it is true also that nothing is moved but by that which is already moved. The questions therefore about the Magnitude and Beginning of the World, are not to be determined by Philosophers, but by those that are lawfully authorised to order the Worship of God. For as Almighty God, when he had brought his People into Judaea, allowed the Priests the first fruits reserved to himself; so when he had delivered up the World to the disputations of Men, it was his pleasure, that all Opinions concerning the nature of Infinite and Eternal, known onely to himself, should (as the first-fruits of Wisdom) be judged by those whose Ministry he meant to use in the ordering of Religion. I cannot therefore commend those that boast they have demonstrated by reasons drawn from natural things, that the World had a Beginning. They are contemned by Idiots, because they understand them not; and by the Learned, because they understand them; by both deservedly. For who can commend him that demonstrates thus? If the World be Eternal, then an infinite number of dayes (or other measures of Time) preceded the birth of Abraham. But the birth of Abraham preceded the birth of Isaac; and therefore one Infinite is greater then another Infinite, or one Eternal then another Eternal; which (he sayes) is absurd. This Demonstration is like his, who from this, that the number of even Numbers is infinite, would conclude, that there are as many even Numbers, as there are Numbers simply, that is to say, the even Numbers are as many, as all the even and od together. They which in this manner take away Eternity from the World, do they not by the same means take away

Eternity from the Creator of the World? From this absurdity therefore they run into another, being forced to call Eternity Nunc stans, a standing still of the present Time, or an abiding Now; and (which is much more absurd) to give to the infinite number of Numbers, the name of Unity. But why should Eternity be called an Abiding Now, rather than an Abiding Then? Wherefore there must either be many Eternities, or Now and Then must signifie the same. With such Demonstrators as these, that speak in another language, it is impossible to enter into disputation. And the men that reason thus absurdly, are not Idiots, but (which makes the absurdity unpardonable) Geometricians, and such as take upon them to be Judges (impertinent, but severe Judges) of other mens Demonstrations. The reason is this, that as soon as they are entangled in the Words Infinite and Eternal, (of which we have in our mind no Idea, but that of our own insufficiency to comprehend them) they are forced either to speak something absurd, or (which they love worse) to hold their peace. For Geometry hath in it somewhat like Wine; which when new, is windy; but afterwards though less pleasant, yet more wholesome. Whatsoever therefore is true, young Geometricians think Demonstrable; but elder not. Wherefore I purposely pass over the Questions of Infinite and Eternal; contenting my self with that Doctrine concerning the Beginning and Magnitude of the World, which I have been perswaded to by the holy Scriptures, and fame of the Miracles which confirm them; and by the Custome of my Country, and reverence due to the Laws. And so I pass on to such things as it is not unlawful to dispute of.

2 Concerning the World it is further questioned, whether the parts thereof be contiguous to one another, in such manner, as not to admit of the least empty space between; and the disputation both for & against it, is carried on with probability enough. For the taking away of Vacuum, I will instance in onely one experiment, a common one, but (I think) unanswerable.

Let AB (in the first fig.) represent a vessel (such as Gardiners use to water their Gardens withal;) whose bottom B is full of little holes; & whose mouth A may be stopt with ones finger when there shall be need. If now this vessel be filled with water, the hole at the top A being stopt, the water will not flow out at any of the holes in the bottom B. But if the finger be removed to let in the air above, it will run out at them all; and as soon as the finger is applied to it again, the water will suddenly & totally be stayed again from running out. The cause whereof seems to be no other but this, that the Water cannot by its natural endeavour to descend, drive down the air below it, because there is no place for it to go into, unless either by thrusting away the next contiguous air it proceed by continual endeavour to the hole A, where it may enter and succeed into the place of the water that floweth out; or else by resisting the endeavour of the water Downwards, penetrate the same, and pass up through it. By the first of these ways (while the hole at A remains stopped) there is no possible passage; nor by the second, unless the holes be so great, that the water flowing out at them, can by its own weight force the Air at the same time to ascend into the vessel by the same holes; as we see it does in a vessel whose mouth is wide enough, when we turn suddenly the bottom upwards to pour out the water; for then the Air being forced by the weight of the water, enters (as is evident by the sobbing and resistance of the water) at the sides or circumference of the orifice. And this I take for a sign that all Space is full; for without this the natural motion of the water (which is a heavy Body) downwards, would not be hindered.

3 On the contrary, for the establishing of Vacuum, many & specious arguments and experiments have been brought. Nevertheless there seems to be something wanting in all of them to conclude it firmly. These arguments for Vacuum are partly made by the followers of the doctrine of Epicurus; who taught that the World consists of very small Spaces not filled

by any Bodie, and of very small Bodies that have within them no empty Space, (which by reason of their hardnesse he calls Atomes); and that these small Bodies and Spaces are every where intermingled. Their arguments are thus delivered by Lucretius.

And first he sayes that unlesse it were so, there could be no motion; For the office and property of Bodies is to withstand and hinder motion. If therfore the Universe were filled with Body, motion would every where be hindered, so, as to have no beginning any where; & consequently there would be no motion at all. It is true that in whatsoever is full, and at rest in all its parts, it is not possible motion should have beginning. But nothing is drawn from hence for the proving of Vacuum. For though it should be granted that there is Vacuum; yet if the Bodies which are intermingled with it, should all at once and together be at rest, they would never be moved again. For it has been demonstrated above (in the 9th Chapter 7th Article) that nothing can be moved but by that which is contiguous and already moved. But supposing that all things are at rest together, there can be nothing contiguous and moved; and therefore no beginning of motion. Now the denying of the beginning of motion, doth not take away present motion, unless beginning be taken away from Body also. For motion may be either coeternal, or concreated with Body. Nor doth it seem more necessary that Bodies were first at rest, and afterwards moved, then that they were first moved, and rested (if ever they rested at all) afterwards. Neither doth there appear any cause, why the matter of the World should for the admission of motion, be intermingled with empty spaces, rather then full; I say full, but withall fluid. Nor lastly, is there any reason why those hard Atomes may not also by the motion of intermingled fluid matter be congregated & brought together into compounded Bodies of such bigness as we see. Wherefore nothing can by this argument be concluded, but that motion was either coeternal, or of the same duration with that which is moved; neither of

which conclusions consisteth with the doctrine of Epicurus, who allows neither to the World nor to Motion any Beginning at all. The necessity therefore of Vacuum is not hitherto demonstrated. And the cause (as far as I understand from them that have discoursed with me of Vacuum) is this, that whilst they contemplate the nature of Fluid, they conceive it to consist as it were of small grains of hard matter, in such manner as meal is fluid, made so by grinding of the Corn; when nevertheless it is possible to conceive Fluid to be of its own nature as homogeneous, as either an Atome, or as Vacuum, it self.

The second of their arguments is taken from waight, and is contained in these Verses of Lucretius,

Corporis officium est quoniam premere omnia deorsum;

Contrà autem natura manet sine Pondere Inanis;

Ergo quod magnum est aequè, Leviusque videtur,

Nimirum plus esse sibi declarat Inanis.

That is to say, Seeing the office and property of Body is to press all things downwards; and on the contrary, seeing the nature of Vacuum is to have no waight at all; Therefore when of two Bodies of equal magnitude, one is lighter then the other, it is manifest that the lighter Body hath in it more Vacuum then the other.

To say nothing of the Assumption concerning the endeavour of Bodies downwards, which is not rightly assumed, because the World hath nothing to do with Downwards, which is a mere fiction of ours; Nor of this, that if all things tended to the same lowest part of the World, either there would be no coalescence at all of Bodies, or they would all be gathered together into the same place. This onely is sufficient to take away the force of the argument, that Aire intermingled with those his Atomes, had served as well for his purpose, as his intermingled Vacuum.

The third argument is drawn from this, That Lightning, Sound, Heat and Cold do penetrate all Bodies (except Atomes) how solid soever they be. But this reason, except it be first demonstrated that the same things cannot happen (without Vacuum) by perpetual generation of Motion, is altogether invalid. But that all the same things may so happen, shall in due place be demonstrated.

Lastly, the fourth argument is set down by the same Lucretius in these Verses.

Duo de concursu corpora lata
Si citò dissiliant, nempe aer omne necesse est
Inter corpora quod fuerat, possidat Inane.
Is porro quamvis circum celerantibus auris
Confluat, haud poterit tamen uno tempore totum
Compleri spatium; nam primum quemque necesse est
Occupet ille locum, deinde omnia possideantur.

That is, If two flat Bodies be suddenly pulled asunder, of necessity the Air must come between them to fill all the space they left empty. But with what celerity soever the Air flow in, yet it cannot in one instant of time fill the whole space, but first one part of it, then successively all.

Which nevertheless is more repugnant to the opinion of Epicurus, then of those that deny Vacuum. For though it be true, that if two Bodies were of infinite hardness, and were joyned together by their Superficies which were most exactly plain, it would be impossible to pull them asunder, in regard it could not be done but by Motion in an instant; yet, if as the greatest of all Magnitudes cannot be given, nor the swiftest of all Motions, so neither the hardest of all hard Bodies; it might be, that by the application of very great force, there might be place made for a successive flowing in of the Aire, namely by separating the parts of the joyned Bodies by succession, beginning at the outermost and ending at the innermost part. He ought

therefore first to have proved, that there are some Bodies extreamly hard, not relatively, as compared with softer Bodies, but absolutely, that is to say, infinitely hard; which is not true. But if we suppose (as Epicurus doth) that Atomes are indivisible, and yet have small superficies of their own; then if two Bodies should be joyned together by many, or but one onely small superficies of either of them, then I say this argument of Lucretius would be a firme demonstration, that no two Bodies made up of Atomes (as he supposes) could ever possibly be pulled asunder by any force whatsoever. But this is repugnant to daily experience.

And thus much of the arguments of Lucretius. Let us now consider the arguments which are drawn from the experiments of later Writers.

4 The first experiment is this, That if a hollow vessel be thrust into water with the bottom upwards, the water will ascend into it; which they say it could not do, unless the Aire within were thrust together into a narrower place; and that this were also impossible except there were little empty places in the Aire. Also that when the Aire is compressed to a certain degree, it can receive no further compression, its small particles not suffering themselves to be pent into less room. This reason, if the Aire could not pass through the Water as it ascends within the vessel, might seem valid. But it is sufficiently known, that Aire will penetrate Water by the application of a force equal to the gravity of the Water. If therefore the force by which the Vessel is thrust down, be greater, or equal to the endeavour by which the water naturally tendeth downwards, the Aire will go out that way where the resistance is made, namely, towards the edges of the Vessel. For, by how much the deeper is the water which is to be penetrated, so much greater must be the depressing force. But after the Vessel is quite under water, the force by which it is depressed, that is to say, the force by which the water riseth up, is no longer encreased. There is therefore such an equilibration between them, as that the natural endeavour of the water

downwards, is equal to the endeavour by which the same water is to be penetrated to the encreased depth.

The second experiment is, That if a concave Cylinder of sufficient length (made of Glass, that the experiment may be the better seen) having one end open, and the other close shut, be filled with Quicksilver, and the open end being stopped with ones finger, be together with the finger dipped into a dish or other vessel in which also there is Quicksilver, and the Cylinder be set upright, we shall, the finger being taken away (to make way for the descent of the Quicksilver) see it descend into the Vessel under it, till there be onely so much remayning within the Cylinder as may fill about 26 Inches of the same; and thus it will alwayes happen whatsoever be the Cylinder, provided that the length be not less then 26 Inches. From whence they conclude that the cavity of the Cylinder above the Quicksilver remayns empty of all Body. But in this experiment I finde no necessity at all of Vacuum. For when the Quicksilver which is in the Cylinder descends, the Vessel under it must needs be filled to a greater height, and consequently so much of the contiguous Air must be thrust away as may make place for the Quicksilver which is descended. Now if it be asked whether that Aire goes, what can be answered but this, that it thrusteth away the next Aire, & that the next, & so successively, till there be a return to the place where the propulsion first began? and there, the last Aire thus thrust on will press the Quicksilver in the Vessel with the same force with which the first Aire was thrust away; and if the force with which the Quicksilver descends be great enough (which is greater or less, as it descends from a place of greater or less height) it will make the Aire penetrate the Quicksilver in the vessel, and go up into the Cylinder to fill the place which they thought was left empty. But because the Quicksilver hath not in every degree of height force enough to cause such penetration, therefore in descending it must of necessity stay somewhere, namely there, where its endeavour downwards, and the

resistance of the same to the penetration of the Aire come to an aequilibrium. And by this experiment it is manifest, that this aequilibrium will be at the height of 26 Inches, or thereabouts.

The third experiment is, That when a Vessel hath as much Air in it as it can naturally contain, there may nevertheless be forced into it as much water as will fill three quarters of the same Vessel. And the experiment is made in this manner. Into the glass bottle, represented (in the 2d figure) by the Sphere F G, whose center is A, let the pipe B A C be so fitted, that it may precisely fill the mouth of the bottle; and let the end B, be so neer the bottom, that there may be onely space enough left for the free passage of the water which is thrust in above. Let the upper end of this pipe have a Cover at D, with a spout at E, by which the water (when it ascends in the pipe) may run out. Also let H C be a Cock, for the opening or shutting of the passage of the water between B and D, as there shall be occasion. Let the Cover D E be taken off; and the Cock H C being opened, let a Syringe full of water be forced in; and before the Syringe be taken away, let the Cock be turned to hinder the going out of the Aire. And in this manner let the injection of water be repeated as often as it shall be requisite, till the water rise within the bottle, for example, to G F. Lastly, the Cover being fastened on again, and the Cock H C opened, the water will run swiftly out at E, and sink by little and little from G F to the bottom of the pipe B.

From this Phaenomenon they argue for the necessity of Vacuum in this manner. The Bottle from the beginning was full of Aire; which Aire could neither go out by penetrating so great a length of water as was injected by the pipe, nor by any other way. Of necessity therefore all the water as high as F G, as also all the Aire that was in the bottle before the water was forced in, must now be in the same place, which at first was filled by the Aire alone; which were impossible, if all the space within the bottle were formerly filled with Aire precisely, that is, without any Vacuum. Besides,

though some man perhaps may think the Air, being a thinne Body, may pass through the Body of the water contained in the pipe, yet from that other Phaenomenon, (namely, that all the water which is in the space B F G, is cast out again by the spout at E, for which it seems impossible that any other reason can be given besides the force by which the Aire frees it self from compression) it follows, that either there was in the bottle some space empty, or that many Bodies may be together in the same place. But this last is absurd; and therefore the former is true, namely, that there was Vacuum.

This argument is infirm in two places. For first that is assumed which is not to be granted; and in the second place an experiment is brought, which I think is repugnant to Vacuum. That which is assumed is, that the Aire can have no passage out through the pipe. Nevertheless we see daily that Aire easily ascends from the bottom to the Superficies of a River (as is manifest by the bubbles that rise); nor doth it need any other cause to give it this motion, then the natural endeavour downwards of the Water. Why therefore may not the endeavour upwards of the same Water acquired by the injection (which endeavour upwards is greater then the natural endeavour of the water downwards) cause the aire in the bottle to penetrate in like manner the water that presseth it downwards; especially seeing the water as it riseth in the bottle, doth so press the Aire that is above it, as that it generateth in every part thereof an endeavour towards the external superficies of the pipe, and consequently maketh all the parts of the enclosed aire to tend directly towards the passage at B? I say this is no less manifest, then that he aire which riseth up from the bottom of a River should penetrate the water, how deep soever it be. Wherefore I do not yet see any cause why the force by which the water is injected, should not at the same time eject the aire.

And as for their arguing the necessity of Vacuum from the rejection of the water; In the first place, supposing there is Vacuum, I demand by what principle of motion that ejection is made. Certainly, seeing this motion is

from within outwards, it must needs be caused by some Agent within the bottle; that is to say, by the aire it self. Now the motion of that aire, being caused by the rising of the water, begins at the bottom, and tends upwards; whereas the motion by which it ejecteth the water ought to begin above, and tend downwards. From whence therefore hath the enclosed aire this endeavour towards the bottom. To this question I know not what answer can be given, unless it be said, that the aire descends of its own accord to expel the water. Which because it is absurd, and that the aire after the water is forced in, hath as much room as its magnitude requires, there will remain no cause at all why the water should be forced out. Wherefore the assertion of Vacuum is repugnant to the very experiment which is here brought to establish it,

Many other Phaenomena are usually brought for Vacuum, as those of Weather-glasses, Aeolipiles, Wind-guns, &c. Which would all be very hard to be salved, unless water be penetrable by aire, without the intermixture of empty space. But now, seeing aire may with no great endeavour pass through, not onely water, but any other fluid Body, though never so stubborn, as Quicksilver, these Phaenomena prove nothing. Nevertheless, it might in reason be expected, that he that would take away Vacuum, should without Vacuum shew us such causes of these Phaenomena, as should be at least of equal, if not greater probability. This therefore shall be done in the following discourse, when I come to speak of these Phaenomena in their proper places. But first the most general Hypotheses of natural Philosophy are to be premised.

And seeing that Suppositions are put for the true Causes of apparent Effects, every Supposition, except such as be absurd, must of necessity consist of some supposed possible Motion (for Rest can never be the Essicent Cause of any thing), & Motion supposeth Bodies Moveable; of which there are three kinds, Fluid, Consistent, and mixt of both. Fluid are

those, whose parts may by very weak endeavour be separated from one another; and Consistent those, for the separation of whose parts greater force is to be applied. There are therefore degrees of Consistency; which degrees, by comparison with more or less Consistent, have the names of Hardness, or Softness. Wherefore a Fluid Body is always divisible into Bodies equally Fluid, as Quantity into Quantities; and Soft Bodies, of whatsoever degree of Softness, into Soft Bodies of the same degree. And though many men seem to conceive no other difference of Fluidity, but such as ariseth from the different magnitudes of the parts (in which Sense, Dust, though of Diamonds, may be called Fluid); Yet I understand by Fluidity, that which is made such by Nature equally in every part of the Fluid Body; not as Dust is Fluid, for so a House which is falling in pieces may be called Fluid; but in such manner as Water seems Fluid, and to divide it self into parts perpetually Fluid. And this being well understood, I come to my Suppositions.

5 First, therefore I suppose, That the Immense Space which we call the World, is the Aggregate of all Bodies; which are either Consistent & Visible, as the Earth and the Starres; or Invisible, as the small Atomes which are disseminated through the whole space between the Earth and the Stars; and lastly, that most Fluid Aether, which so fills all the rest of the Universe, as that it leaves in it no empty place at all.

Secondly, I suppose with Copernicus, That the greater Bodies of the World, which are both consistent and permanent, have such order amongst themselves, as that the Sunne hath the first place, Mercury the second, Venus the third, The Earth (with the Moon going about it) the fourth, Mars the fifth, Jupiter (with his Attendants) the sixth, Saturne the seventh, and after these the Fixed Starres have their several distances from the Sunne.

Thirdly, I suppose, That in the Sunne & the rest of the Planets, there is and always has been a Simple Circular Motion.

Fourthly, I suppose, That in the Body of the Aire there are certain other Bodies intermingled, which are not Fluid; but withal that they are so small, that they are not preceptible by Sense, and that these also have their proper Simple Motion; and are some of them more, some less hard or consistent.

Fifthly, I suppose with Kepler, That as the distance between the Sunne and the Earth, is to the distance between the Moon and the Earth; so the distance between the Moon and the Earth, is to the Semidiameter of the Earth.

As for the Magnitude of the Circles, and the Times in which they are described by the Bodies which are in them, I will suppose them to be such as shall seem most agreeable to the Phaenomena in question,

6 The causes of the different Seasons of the Year, and of the several variations of Dayes and Nights in all the parts of the superficies of the Earth, have been demonstrated first by Copernicus, and since by Kepler, Galilaeus and others, from the supposition of the Earths diurnal revolution about its own Axis, together with its Annual motion about the Sunne, in the Ecliptick according to the order of the Signes; and thirdly, by the annual revolution of the same Earth about its own center contrary to the order of the Signs. I suppose with Copernicus, That the diurnal revolution is from the motion of the Earth, by which the Aequinoctial Circle is described about it. And as for the other two annual motions, they are the efficient cause of the Earths being carried about in the Ecliptick in such manner, as that its Axis is alwayes kept parallel to it self. Which parallelisme was for this reason introduced, lest by the Earths annual revolution, its Poles should seem to be necessarily carried about the Sunne, contrary to experience. I have (in the 10th Artic. of the th Chap.) demonstrated from the supposition of Simple Circular Motion in the Sun, that the Earth is so carried about the Sunne, as that its Axis is thereby kept always parallel to it self. Wherefore, from these two supposed motions in the Sunne, the one Simple Circular

Motion; the other Circular Motion about its own Center, it may be demonstrated, that the Year hath both the same variations of Dayes and Nights, as have been demonstrated by Copernicus.

For if the Circle *abcd* (in the 3d Figure) be the Ecliptick, whose Center is *e*, and Diameter *aec*; and the Earth be placed in *a*, & the Sunne be moved in the little Circle *fghi*, namely, according to the order *f*, *g*, *h* & *i*, it hath been demonstrated, that a Body placed in *a*, will be moved in the same order through the points of the Ecliptick *a*, *b*, *c* & *d*, and will alwayes keep its Axis parallel to its self.

But if (as I have supposed) the Earth also be moved with Simple Circular Motion in a plain that passeth through *a*, cutting the plain of the Ecliptick so, as that the common section of both the plains be in *ac*, thus also the Axis of the Earth will be kept alwayes parallel to it self. For let the Center of the Earth be moved about in the Circumference of the Epicycle whose Diameter is *lak*, which is a part of the straight line *lac*. Therefore *lak* the Diameter of the Epicycle, passing through the Center of the Earth, will be in the plain of the Ecliptick. Wherefore seeing that by reason of the Earths Simple Motion both in the Ecliptick and in its Epicycle, the straight line *lak* is kept alwayes parallel to it self, every other straight line also taken in the Body of the Earth, and consequently its Axis, will in like manner be kept alwayes parallel to it self; so that in what part soever of the Ecliptick the Center of the Epicycle be found, and in what part soever of the Epicycle the Center of the Earth be found at the same time, the Axis of the Earth will be parallel to the place where the same Axis would have been, if the Center of the Earth had never gone out of the Ecliptick.

Now as I have demonstrated the simple annual motion of the Earth from the supposition of Simple Motion in the Sunne; so from the supposition of Simple Motion in the Earth may be demonstrated the monethly Simple

Motion of the Moon. For if the names be but changed the Demonstration will be the same, and therefore need not be repeated.

7 That which makes this supposition of the Sunnes Simple Motion in the Epicycle fghi probable, is First, that the Periods of all the Planets are not onely described about the Sunne, but so described, as that they are all contained within the Zodiack, that is to say, within the latitude of about 16 degrees; for the cause of this seems to depend upon some power in the Sunne, especially in that part of the Sunne which respects the Zodiack. Secondly, that in the whole copasse of the heavens there appears no other Body, from which the cause of this Phaenomenon can in probability be derived. Besides, I could not imagine, that so many and such various motions of the Planets should have no dependance at all upon one another. But by supposing motive power in the Sunne, we suppose motion also; for power to move, without motion, is no power at all. I have therefore supposed that there is in the Sunne for the governing of the primary Planets, and in the Earth for the governing of the Moon, such motion, as being received by the primary Planets and by the Moon, makes them necessarily appear to us in such manner as we see them; Whereas, that circular motion (which is commonly attributed to them) about a fixed Axis, (which is called Conversion) being a motion of their parts onely, and not of their whole Bodies, is insufficient to salve their Appearances. For seeing whatsoever is so moved, hath no endeavour at all towards those parts which are without the circle, they have no power to propagate any endeavour to such Bodies as are placed without it. And as for them that suppose this may be done by Magnetical Virtue, or by incorporeall and immateriall Species, they suppose no naturall cause; nay no cause at all. For there is no such thing as an Incorporeal Movent; and Magnetical Virtue is a thing altogether unknown; and whensoever it shall be known, it will be found to be a motion of Body. It remaines therefore, that if the primary Planets be carried about by the

Sunne, and the Moon by the Earth, they have the simple circular motions of the Sunne and the Earth for the causes of their circulations. Otherwise, if they be not carried about by the Sunne and the Earth, but that every Planet hath been moved as it is now moved ever since it was made, there will be of their motions no cause naturall. For either these motions were concreated with their Bodies, and their cause is supernatural; or they are coeternal with them, and so they have no cause at all. For whatsoever is Eternall was never generated.

I may add besides, to confirme the probability of this simple motion, that almost all learned men are now of the same opinion with Copernicus concerning the parallelisme of the Axis of the Earth, it seemed to me to be more agreeable to truth, or at least more handsome, that it should be caused by simple Circular Motion alone, than by two motions, one in the Ecliptick, and the other about the Earths own Axis the contrary way, neither of them Simple, nor either of them such as might be produced by any motion of the Sunne. I thought best therefore to retain this Hypothesis of Simple Motion; and from it to derive the causes of as many of the Phaenomena as I could, and to let such alone as I could not deduce from thence.

It will perhaps be objected, that although by this supposition the reason may be given of the Parallelisme of the Axis of the Earth, and of many other Appearances; nevertheless, seeing it is done by placing the Body of the Sunne in the Center of that Orbe which the Earth describes with its annual motion, the supposition it self is false, because this annual Orbe is excentrique to the Sunne. In the first place therefore let us examine what that Excentricity is, and whence it proceeds.

8 Let the annual Circle of the Earth abcd (in the same 3d figure) be divided into four equal parts by the straight lines ac & bd, cutting one another in the Center e; and let a be the beginning of Libra, b of Capricorn, c of Aries, and d of Cancer; and let the whole Orbe abcd be understood

(according to Copernicus) to have every way so great distance from the Zodiack of the fixed Starres, that it be in comparison with it but as a point. Let the Earth be now supposed to be in the beginning of Libra at a. The Sunne therefore will appear in the beginning of Aries at c. Wherefore if the Earth be moved from a to b, the apparent motion of the Sunne will be from c to the beginning of Cancer in d; and the Earth being moved forwards from b to c, the Sunne also will appear to be moved forwards to the beginning of Libra in a; Wherefore cda will be the Summer Arch, and the Winter Arch will be abc. Now in the time of the Suns apparent motion in the Summer Arch, there are numbred $186\frac{3}{4}$ dayes; and consequently the Earth makes in the same time the same number of diurnal conversions in the Arch abc; and therefore the Earth in its motion through the Arch cda will make onely $178\frac{1}{2}$ diurnal conversions, Wherefore the Arch a b c ought to be greater then the Arch c d a by $8\frac{1}{4}$ dayes, that is to say, by almost so many degrees. Let the Arch a r, as also c s, be each of them an Arch of two degrees and $\frac{1}{16}$. Wherefore the Arch r b s will be greater then the Semicircle a b c by 4 degrees and $\frac{1}{8}$, and greater then the Arch s d r by 8 degrees and $\frac{1}{4}$. The Equinoxes therefore will be in the points r & s; and therefore also when the Earth is in r, the Sunne will appear in s. Wherefore the true place of the Sunne will be in t, that is to say, without the Center of the Earths annual motion by the quantity of the Sine of the Arch a r, or the Sine of two degrees and 16 minutes. Now this Sine, putting 100000 for the Radius, will be neer 3580 parts thereof. And so much is the Excentricity of the Earths annual motion, provided that that motion be in a perfect circle; and s & r are the Equinoctial points; and the straight lines s r & c a produced both wayes till they reach the Zodiack of the fixed Starres, wil fall stil upon the same fixed Starres, because the whole Orbe a b c d is supposed to have no magnitude at all in respect of the great distance of the fixed Starres.

Supposing now the Sun to be in c, it remains that I shew the cause why the Earth is neerer to the Sunne, when in its annual motion it is found to be in d, then when it is in b. And I take the cause to be this. When the Earth is in the beginning of Capricorn at b, the Sunne appears in the beginning of Cancer at d; & then is the midst of Summer. But in the midst of Summer, the Northern parts of the Earth are towards the Sunne, which is almost all dry land, containing all Europe, and much the greatest part of Asia and America. But when the Earth is in the beginning of Cancer at d, it is the midst of Winter, and that part of the Earth is towards the Sunne, which contains those great Seas called the South Sea and the Indian Sea, which are of farre greater extent then all the dry Land in that Hemisphere. Wherefore (by the last Article of the 21 Chapter) when the Earth is in d, it will come neerer to its first Movent, that is, to the Sunne which is in t; that is to say, the Earth is neerer to the Sunne in the midst of Winter when it is in d, then in the midst of Summer when it is b; and therefore during the Winter the Sunne is in its Perigaeum, and in its Apogaeum during the Summer. And thus I have shewn a possible cause of the Excentricity of the Earth; which was to be done.

I am therefore of Keplers opinion, in this, that he attributes the Excentricity of the Earth to the difference of the parts thereof, and supposes one part to be affected, and another disaffected to the Sunne. And I dissent from him in this, that he thinks it to be by Magnetick virtue, and that this Magnetick virtue, or attraction and thrusting back of the Earth is wrought by immateriate Species; which cannot be; because nothing can give motion, but a Body moved and contiguous. For if those Bodies be not moved which are contiguous to a Body unmoved, how this Body should begin to be moved is not imaginable; as has been demonstrated in the 7th Article of the 9th Chapter, and often inculcated in other places, to the end that Philosophers might at last abstain from the use of such unconceivable

connexions of words. I dissent also from him in this, that he says the similitude of Bodies is the cause of their mutual attraction, For if it were so, I see no reason why one Egg should not be attracted by another. If therefore one part of the Earth be more affected by the Sunne, then another part, it proceeds from this, that one part hath more water, the other more dry land. And from hence it is, (as I shewed above) that the Earth comes neerer to the Sunne when it shines upon that part where there is more water, then when it shines upon that where there is more dry Land.

9 This Excentricity of the Earth is the cause why the way of its annual motion is not a perfect Circle, but either an Elliptical, or almost an Elliptical line; as also why the Axis of the Earth is not kept exactly parallel to it self in all places, but onely in the Equinoctial points.

Now seeing I have said that the Moon is carried about by the Earth, in the same manner that the Earth is by the Sunne; and that the Earth goeth about the Sunne in such manner as that it shews sometimes one Hemisphere, sometimes the other to the Sunne; it remains to be enquired, why the Moon has alwayes one and the same face turned towards the Earth.

Suppose therefore the Sunne to be moved with Simple Motion in the little Circle f g h i, (in the fourth figure) whose Center is t; and let     be the annuall Circle of the Earth; and a the beginning, of Libra. About the point a let the little Circle l k be described; and in it let the Center of the Earth be understood to be moved with Simple motion; and both the Sunne & the Earth to be moved according to the order of the Signes. Upon the Center a let the way of the Moon m n o p be described; and let q r be the Diameter of a Circle cutting the Globe of the Moon into two Hemispheres, whereof one is seen by us when the Moon is at the full, and the other is turned from us.

The Diameter therefore of the Moon q o r will be perpendicular to the Straight Line t a. Wherefore the Moon is carried by reason of the Motion of

the Earth from o towards p. But by reason of the motion of the Sunne, if it were in p it would at the same time be carried from p towards o; and by these two contrary Movents the straight line q r will be turned about; and in a Quadrant of the Circle m n o p it will be turned so much as makes the fourth part of its whole conversion. Wherefore when the Moon is in p, q r will be parallel to the straight line m o. Secondly, when the Moon is in m, the straight line q r will by reason of the motion of the Earth be in m o. But by the working of the Suns motion upon it in the quadrant p m, to same q r will be turned so much as makes another quarter of its whole conversion. When therefore the Moon is in m, q r will be perpendicular to the straight line o m. By the same reason, when the Moon is in n, q r will be parallel to the straight line m o; and the Moon returning to o, the same q r will return to its first place; and the Body of the Moon will in one entire period make also one entire conversion upon her own Axis. In the making of which, it is manifest, that one and the same face of the Moon is always turned towards the Earth. And if any Diameter were taken in that little Circle, in which the Moon were supposed to be carried about with simple motion, the same effect would follow; for if there were no action from the Sun, every Diameter of the Moon would be carried about always parallel to it self. Wherefore I have given a possible cause, why one and the same face of the Moon is alwayes turned towards the Earth.

But it is to be noted, that when the Moon is without the Ecliptick, we do not alwayes see the same face precisely. For we see onely that part which is illuminated. But when the Moon is without the Ecliptick, that part which is towards us, is not exactly the same with that which is illuminated.

10 To these three simple motions, one of the Sunne, another of the Moon, and the third of the Earth, in their own little Circles f g h i, l k, & q r, together with the Diurnal conversion of the Earth (by which conversion all things that adhere to its superficies are necessarily carried about with it)

may be referred the three Phaenomena concerning the Tides of the Ocean. Whereof the first, is the alternate elevation and depression of the Water at the Shores, twice in the space of 24 houres and neer upon 52 minutes; for so it has constantly continued in all ages. The second, that at the New and Full Moons the elevations of the Water are greater, then at other times between. And the third, that when the Sunne is in the Equinoctial, they are yet greater then at any other time. For the salving of which Phaenomena, we have already the foure abovementioned Motions; to which I assume also this, that the part of the Earth which is called America, being higher then the Water, and extended almost the space of a whole Semicircle from North to South, gives a stop to the motion of the Water. This being granted,

In the same 4th figure, where $l b k c$ is supposed to be in the plain of the Moons monethly motion, let the little Circle $l d k e$ be described about the same Center a in the plain of the Equinoctial. This Circle therefore will decline from the Circle $l b k c$ in an angle of almost 28 degrees and $\frac{1}{2}$ (for the greatest declination of the Ecliptick is $23\frac{1}{2}$, to which adding 5 for the greatest declination of the Moon from the Ecliptick, the summe wil be 28 degrees and $\frac{1}{2}$). Seeing now the Waters which are under the Circle of the Moons course, are (by reason of the Earths Simple Motion in the plain of the same Circle) moved together with the Earth, (that is to say, together with their own bottoms) neither out-going nor out-gone; if we add the Diurnal motion, by which the other Waters which are under the Equinoctial are moved in the same order; and consider withall that the Circles of the Moon and of the Equinoctial intersect one another; it will be manifest, that both those Waters, which are under the Circle of the Moon, and under the Equinoctiall, will runne together under the Equinoctial; and consequently, that their Motion will not onely be swifter then the ground that carries them; but also that the waters themselves will have greater elevation whensoever

the Earth is in the Equinoctial. Wherefore, whatsoever the cause of the Tides may be, this may be the cause of their augmentation at that time.

Againe, seeing I have supposed the Moon to be carried about by the simple motion of the Earth in the little circle lbkc; and demonstrated (at the 4 article of the 21 chapter) that whatsoever is moved by a Movent that hath simple motion, will be moved allwayes with the same velocity; it follows, that the center of the Earth will be carried in the circumference lbkc with the same velocity, with which the Moon is carried in the circumference mnop. Wherefore the time in which the Moon is carried about in mnop, is to the time in which the Earth is carried about in lbkc, as one circumference to the other, that is, as ao to ak. But ao is observed to be to the Semidiameter of the Earth as 59 to 1; and therefore the Earth (if ak be put for its Semidiameter) will make 59 revolutions in lbkc, in the time that the Moon makes one monthly circuit in mnop. But the Moon makes her monthly circuit in little more then 29 dayes. Wherefore the Earth shal make its circuit in the circumference lbkc in 12 hours and a little more, namely about 26 minutes more; that is to say, it shall make two circuits in 24 hours and allmost 52 minutes; which is observed to be the time between the high water of one day and the high water of the day following. Now the course of the waters being hindered by the southern part of America, their motion will be interrupted there; and consequently, they will be elevated in those places, and sink down again by their own waight, twice in the space of 24 hours and 52 minutes. And thus I have given a possible cause of the diurnall reciprocation of the Ocean.

Now from this swelling of the Ocean in those parts of the Earth, proceed the Flowings and Ebbings in the Atlantick, Spanish, Brittish and German Seas; which though they have their set times, yet upon severall Shores they happen at severall hours of the day; and they receive some augmentation from the North, by reason that the shores of China and Tartaria, hindering

the generall course of the waters, makes them swell there and discharge themselves in part through the straight of Anian into the Northern Ocean, and so into the German Sea.

As for the Spring Tides which happen at the time of the New & Full Moons, they are caused by that simple motion which at the beginning I supposed to be allwayes in the Moone. For as, when I shewed the cause of the Excentricity of the Earth, I derived the elevation of the waters from the simple motion of the Sunne; so the same may here be derived from the simple motion of the Moon. For though from the generation of Clouds, there appeare in the Sunne a more manifest power of elevating the waters, then in the Moon; yet the power of encreasing moisture in Vegetables and living creatures appears more manifestly in the Moon then in the Sunne; which may perhaps proceed from this, that the Sunne raiseth up greater, and the Moon lesser drops of water. Neverthelesse, it is more likely, and more agreeable to common observation, that Raine is raised not only by the Sunne but also by the Moon; for almost all men expect change of weather at the time of the Conjunctions of the Sunne and Moon with one another, and with the Earth, more then in the time of their Quarters.

In the last place, the cause why the Spring Tides are greater at the time of the Aequinoxes, hath been already sufficiently declared in this Article, where I have demonstrated, that the two Motions of the Earth, namely, its Simple Motion in the little Circle lbkc, and its Diurnal motion in ldke, cause necessarily a greater elevation of Waters when the Sunne is about the Aequinoxes, then when he is in other places. I have therefore given possible causes of the Phaenomenon of the Flowing and Ebbing of the Ocean.

11 As for the explication of the yearly Praecession of the Aequinoctial points, we must remember, that (as I have already shewn) the annual motion of the Earth is not in the Circumference of a Circle, but of an Ellipsis, or a

line not considerably different from that of an Ellipsis. In the first place therefore this Elliptical line is to be described.

Let the Ecliptick     (in the 5th figure) be divided into four equal parts by the two straight lines ab and  , cutting one another at right angles in the Center c; and taking the Arch bd of 2 degrees and 16 minutes, let the straight line de be drawn parallel to ab and cutting   in f; which being done, the Excentricity of the Earth will be cf. Seeing therefore the annual motion of the Earth is in the Circumference of an Ellipsis, of which   is the greater Axis, ab cannot be the lesser Axis; for ab and   are equal. Wherefore the Earth passing through a & b, will either pass above  , as through g, or passing through  , will fall between c and a; it is no matter which. Let it pass therefore through g; and let gl be taken equal to the straight line  ; and dividing gl equally in i, gi will be equal to  , & il equal to f ; and consequently the point i will cut the Excentricity cf into two equal parts; and taking ih equal to if, hi will be the whole Excentricity. If now a straight line (namely, the line  i ) be drawn through i parallel to the straight lines ab and ed, the way of the Sunne in Summer (namely, the Arch  g ) will be greater then his way in Winter by 8 degrees and $\frac{1}{4}$. Wherefore the true Aequinoxes will be in the straight line  i ; and therefore the Ellipsis of the Earths annual motion will not pass through a, g, b & l; but through  , g,  & l. Wherefore the annual motion of the Earth is in the Ellipsis  g  l, and cannot be (the Excentricity being salved) in any other line. And this perhaps is the reason, why Kepler, against the opinion of all the Astronomers of former time, thought fit to bisect the Excentricity of the Earth, or (according to the Ancients) of the Sunne, not by diminishing the quantity of the same Excentricity, because the true measure of that quantity, is the difference by which the Summer Arch exceeds the Winter Arch, but by taking for the Center of the Ecliptick of the great Orbe the point c neerer to f, & so

placing the whole great Orbe as much neerer to the Ecliptick of the fixed Stars towards ♌, as is the distance between c & i. For seeing the whole great Orbe is but as a point in respect of the immense distance of the fixed Starres, the two straight lines ♈ ♎ and ab being produced both wayes to the beginnings of Aries and Libra, will fall upon the same points of the Sphere of the fixed Stars. Let therefore the Diameter of the Earth mn be in the plain of the Earths annual motion. If now the Earth be moved by the Sunnes simple motion in the Circumference of the Ecliptick about the Center i, this Diameter will bee kept alwayes parallel to itself and to the straight line gl. But seeing the Earth is moved in the Circumference of an Ellipsis without the Ecliptick, the point n, whilst it passeth through ♈ ♎ ♎ will go in a lesser Circumference then the point m; and consequently as soon as ever it begins to be moved, it will lose its parallelisme with the straight line ♎ ♌ so that mn produced will at last cut the straight line gl produced. And contrarily, as soon as mn is past ♎, (the Earth making its way in the internal Ellipticall line ♎ l ♈) the same mn produced towards m, will cut lg produced. And when the Earth hath allmost finished its whole circumference, the same mn shall againe make a right angle with a line drawn from the center i, a little short of the point from which the Earth began its motion. And there the next yeare shall be one of the Aequinoctial points, namely, neer the end of ♎; the other shall be opposite to it neer the end of ♈. And thus the points in which the Days and Nights are made equall, doe every year fall back; but with so slow a motion, that in a whole year, it makes but 51 first minutes. And this relapse being contrary to the order of the Signes, is commonly called the Praecession of the Aequinoxes. Of which I have from my former Suppositions deduced a possible cause; which was to be done.

According to what I have said concerning the cause of the Excentricity of the Earth; and according to Kepler, who for the cause thereof supposeth

one part of the Earth to be affected to the Sunne the other part to be disaffected, the Apogaeum & Perigaeum of the Sunne should be moved every year in the same order, and with the same velocity, with which the Aequinoctiall points are moved; and their distance from them should allwayes be the quadrant of a circle; which seems to be otherwise. For Astronomers say, that the Aequinoxes are now, the one about 28 degrees gone back from the first Star of Aries, the other as much from the beginning of Libra. So that the Apogaeum of the Sunne, or the Aphelium of the Earth ought to be about the 28th degree of Cancer; but it is reckoned to be in the 7th degree. Seeing therefore we have not sufficient evidence of the (that so it is), it is in vaine to seek for the (why it is so). Wherefore, as long as the motion of the Apogaeum is not observable by reason of the slownesse thereof; and as long as it remaiues doubtful whether their distance from the Aequinoctiall points be more or lesse then a quadrant precisely; so long it may be lawfull for me to thinke they proceed both of them with equall velocity.

Also, I doe not at all meddle with the causes of the Excentricities of Saturne, Jupiter, Mars, and Mercury. Neverthelesse, seeing the Excentricity of the Earth may (as I have shewne) be caused by the unlike constitution of the several parts of the Earth which are alternately turned towards the Sunne, it is credible also that like effects may be produced in these other Planets from their having their Superficies of unlike parts.

And this is all I shall say concerning Sidereal Philosophy. And though the causes I have here supposed be not the true causes of these Phaenomena, yet I have demonstrated that they are sufficient to produce them, according to what I at first propounded.

CHAP. XXVII. OF LIGHT, HEAT, AND OF COLOURS.

- 1 OF THE immense Magnitude of some Bodies, and the unspeakable Littleness of others.
- 2 Of the cause of the Light of the Sun.
- 3 How Light heateth.
- 4 The generation of Fire from the Sunne.
- 5 The generation of Fire from Collision.
- 6 The cause of Light in Glow-wormes, Rotten Wood, and the Bolonian Stone.
- 7 The cause of Light in the concussion of Sea-water.
- 8 The cause of Flame, Sparks, and Colliquation.
- 9 The cause why wet Hay sometimes burns of its own accord. Also the cause of Lightning.
- 10 The cause of the force of Gunpowder; and what is to be ascribed to the Coals, what to the Brimstone, and what to the Nitre.
- 11 How Heat is caused by Attrition.
- 12 The distinction of Light into First, Second, &c.
- 13 The causes of the Colours we see in looking through a Prisma of Glass, namely, of Red, Yellow, Blue and Violet Colour.

14 Why the Moon and the Starres appear redder in the Horizon then in the midst of the Heaven.

15 The cause of Whiteness.

16 The cause of Blackness.

1 BESIDES the Starres (of which I have spoken in the last Chapt.), whatsoever other Bodies there be in the World, they may be all comprehended under the name of Intersidereal Bodies. And these I have already supposed to be either the most fluid Aether, or such Bodies whose parts have some degree of cohaesion. Now these differ from one another in their several Consistencies, Magnitudes, Motions and Figures. In Consistency I suppose some Bodies to be Harder, others Softer through all the several degrees of Tenacity. In Magnitude, some to be Greater, others Less, and many unspeakably Little. For we must remember that by the Understanding, Quantity is divisible into divisibles perpetually. And therefore if a man could do as much with his hands as he can with his Understanding, he would be able to take from any given magnitude, a part which should be less then any other magnitude given. But the Omnipotent Creator of the World can actually from a part of any thing take another part, as farre as we by our Understanding can conceive the same to be divisible. Wherefore there is no impossible Smalness of Bodies. And what hinders but that we may think this likely? For we know there are some living Creatures so small that we can scarce see their whole Bodies. Yet even these have their young ones, their little Veins, and other Vessels, and their Eyes so small, as that no Microscope can make them visible. So that we cannot suppose any magnitude so little, but that our very supposition is actually exceeded by Nature. Besides, there are now such Microscopes commonly made, that the things we see with them appear a hundred thousand times bigger, then they would do if we looked upon them with our bare Eyes. Nor

is there any doubt but that by augmenting the power of these Microscopes (for it may be augmented as long as neither Matter nor the hands of Workmen are wanting) every one of those hundred thousandth parts might yet appear a hundred thousand times greater than they did before. Neither is the Smallness of some Bodies to be more admired, than the vast Greatness of others. For it belongs to the same infinite Power, as well to augment infinitely, as infinitely to diminish; To make the great Orbe, (namely, that whose Radius reacheth from the Earth to the Sunne) but as a point in respect of the distance between the Sunne and the fixed Starres; and on the contrary, to make a Body so little, as to be in the same proportion less than any other visible Body, proceeds equally from one and the same Authour of Nature. But this of the immense distance of the fixed Starres (which for a long time was accounted an incredible thing) is now believed by almost all the Learned. Why then should not that other of the smallness of some Bodies, become credible at some time or other? For the Majesty of God appears no less in small things than in great; and as it exceedeth humane sense in the immense greatness of the Universe; so also it doth in the smallness of the parts thereof. Nor are the first Elements of Compositions, nor the first Beginnings of Actions, nor the first Moments of Times more credible, than that which is now believed of the vast distance of the fixed Starres.

Some things are acknowledged by mortal men to be very Great, though Finite, as seeing them to be such. They acknowledge also, that some things which they do not see, may be of infinite magnitude. But they are not presently, nor without great study perswaded that there is any Mean between Infinite & the Greatest of those things which either they see or imagine. Nevertheless, when after meditation & contemplation, many things which we wondered at before are now grown more familiar to us, we then believe them, and transferre our admiration from the Creatures to the

Creator. But how little soever some Bodies may be; yet I will not suppose their quantity to be less, then is requisite for the salving of the Phaenomena. And in like manner I shall suppose their motion, namely, their Velocity and Slowness, and the Variety of their Figures, to be onely such as the explication of their natural causes requires. And lastly, I suppose, that the parts of the pure Aether (as if it were the First Matter) have no motion at all, but what they receive from Bodies which float in them, and are not themselves fluid.

2 Having laid these Grounds, let us come to speake of Causes, and in the first place let us inquire what may be the cause of the Light of the Sunne. Seeing therefore the Body of the Sunne doth by its simple circular motion thrust away the ambient aethereall substance sometimes one way sometimes another, so that those parts which are next the Sunne being moved by it, doe propagate that motion to the next remote parts, and these to the next, and so on continually; it must needs be, that notwithstanding any distance, the foremost part of the Eie will at last be pressed; and by the pressure of that part, the motion will be propagated to the innermost part of the Organ of Sight, namely to the Heart; and from the reaction of the Heart, there will proceed an endeavour back by the same way, ending in the endeavour outwards of the Coat of the Eie called the Retina. But this endeavour outwards (as has been defined in the 25 chapter) is the thing which is called Light, or the Phantasme of a Lucid Body. For it is by reason of this Phantasme that an Object is called Lucid. Wherefore we have a possible cause of the Light of the Sunne; which I undertook to find.

3 The generation of the Light of the Sunne is accompanied with the generation of Heat. Now every man knowes what Heat is in himselfe, by feeling it when he growes Hot; but what it is in other things he knowes onely by ratiocination. For it is one thing to grow Hot, and another thing to Heat, or make Hot. And therefore though we perceive that the Fire or the

Sunne Heateth, yet we doe not perceive that it is it selfe Hot. That other living creatures whilst they make other things Hot, are Hot themselves, we inferre by reasoning from the like sense in our selves. But this is not a necessary inference. For though it may truly be said of living Creatures, that They Heat, therefore they are themselves Hot; yet it cannot from hence be truly inferred, that Fire Heateth, therefore it is it selfe Hot; no more then this, Fire causeth Pain, therefore it is it self in Pain. Wherefore that is onely and properly called Hot, which when we feel, we are necessarily Hot.

Now when we grow Hot, we find that our Spirits and Blood, and whatsoever is fluid within us, is called out from the internall to the externall parts of our Bodies, more or lesse, according to the degree of the Heat; and that our Skin swelleth. He therefore that can give a possible cause of this Evocation and Swelling, and such as agreeth with the rest of the Phaenomena of Heat; may be thought to have given the cause of the Heat of the Sunne.

It hath been shewn (in the 5 article of the 21 chapter) that the fluid Medium which we call the Aire, is so moved by the simple circular motion of the Sunne, as that all its parts, even the least, do perpetually change places with one another; which change of places is that which there I called Fermentation. From this Fermentation of the Aire, I have (in the 8 article of the last chapter) demonstrated, that the water may be drawn up into the clouds.

And I shall now shew, that the fluid parts may in like manner by the same Fermentation be drawn out from the internall to the externall parts of our Bodies. For seeing that wheresoever the fluid Medium is contiguous to the Body of any living creature, there the parts of that Medium are by perpetuall change of place separated from one another; the contiguous parts of the living creature must of necessity endeavour to enter into the spaces of the separated parts. For otherwise those parts (supposing there is no

Vacuum) would have no place to go into. And therefore that which is most fluid and separable in the parts of the living creature which are contiguous to the Medium, will go first out; and into the place thereof will succeed such other parts as can most easily transpire through the pores of the skin. And from hence it is necessary, that the rest of the parts which are not separated, must all together be moved outwards, for the keeping of all places full. But this motion outwards of all parts together must of necessity press those parts of the ambient Aire which are ready to leave their places; and therefore all the parts of the Body endeavouring at once that way, makes the Body swell. Wherefore a possible cause is given of Heat from the Sunne; which was to be done.

4 We have now seen how Light and Heat are generated; Heat by the simple motion of the Medium, making the parts perpetually change places with one another; and Light by this, that by the same simple motion Action is propagated in a straight line. But when a Body hath its parts so moved, that it sensibly both Heats and Shines at the same time, then it is, that we say Fire is generated.

Now by Fire I do not understand a Body distinct from matter combustible or glowing, as Wood or Iron, but the matter it self, not simply and always, but then onely when it shineth and heateth. He therefore that renders a cause possible, and agreeable to the rest of the Phaenomena, namely, whence and from what action both the Shining and Heating proceed, may be thought to have given a possible cause of the generation of Fire.

Let therefore ABC (in the first Figure) be a Sphere, or the portion of a Sphere, whose Center is D; and let it be transparent and homogeneous, as Cristal, Glass, or Water, and objected to the Sunne. Wherefore the foremost part ABC, will by the simple motion of the Sunne, by which it thrusts forwards the Medium be wrought upon by the Sun-beams in the straight

lines EA, FB and GC; which straight lines may in respect of the great distance of the Sunne be taken for parallels. And seeing the Medium within the Sphere is thicker then the Medium without it, those Beams will be refracted towards their perpendiculars. Let the straight lines EA and GC be produced till they cut the Sphere in H and I; and drawing the perpendiculars AD and CD, the refracted Beams EA and GC will of necessity fall, the one between AH and AD, the other between CI and CD. Let those refracted Beams be AK and CL. And again, let the lines DKM & DLN be drawn perpendicular to the Sphere; and let AK and CL be produced till they meet with the straight line BD produced in O. Seeing therefore the Medium within the Sphere is thicker then that without it, the refracted line AK will recede further from the perpendicular KM, then KO will recede from the same. Wherefore KO will fall between the refracted line and the perpendicular. Let therefore the refracted line be KP, cutting FO in P, and for the same reason the straight line LP will be the refracted line of the straight line CL. Wherefore, seeing the Beams are nothing else but the Wayes in which the motion is propagated, the motion about P will be so much more vehement then the motion about ABC, by how much the base of the portion ABC is greater then the base of a like portion in the Sphere whose Center is P, and whose magnitude is equal to that of the little Circle about P, which comprehendeth all the Beams that are propagated from ABC; and this Sphere being much less then the Sphere ABC, the parts of the Medium, that is, of the Aire about P, will change places with one another with much greater celerity, then those about ABC. If therefore any matter Combustible, that is to say, such as may be easily dissipated, be placed in P, the parts of that matter (if the proportion be great enough between AC and a like portion of the little circle about P) will be freed from their mutual cohaesion, and being separated will acquire simple motion. But vehement simple motion generates in the beholder a Phantasm of Lucid and

Hot, as I have before deonstrated of the simple motion of the Sunne; and therefore the combustible matter which is placed in P will be made Lucid and Hot, that is to say, will be Fire. Wherefore I have rendered a possible cause of Fire; which was to be done.

5 From the manner by which the Sunne generateth Fire, it is easy to explaine the manner by which Fire may be generated by the collision of two Flints. For by that Collision, some of those particles of which the stone is compacted, are violently separated and thrown off; and being withall swiftly turned round, the Eie is moved by them, as it is in the generation of Light by the Sunne. Wherefore they shine; and falling upon matter which is already halfe dissipated, such as is Tinder, they throughly dissipate the parts thereof, and make them turn round. From whence (as I have newly shewn) Light and Heat, that is to say, Fire is generated.

6 The shining of Glow-worms, some kinds of Rotten Wood, and of a kinde of stone made at Bologna, may have one common cause, namely the exposing of them to the hot Sunne. We finde by experience that the Bolonian stone shines not unless it be so exposed; and after it has been exposed it shines but for a little time, namely, as long as it retains a certain degree of heat. And the cause may be, that the parts of which it is made, may together with heat have Simple Motion imprinted in them by the Sunne. Which if it be so, it is necessary, that it shine in the dark, as long as there is sufficient heat in it; but this ceasing, it will shine no longer. Also we find by experience, that in the Glow-worm there is a certain thick humour, like the Cristalline humour of the Eie; which if it be taken out, and held long enough in ones fingers, and then be carried into the dark, it will shine by reason of the warmth it received from the fingers; but as soon as it is cold, it will cease shining. From whence therefore can these creatures have their Light, but from lying all day in the Sun-shine, in the hottest time of Summer? In the same manner, Rotten Wood, except it grow rotten in the

Sunshine, or be afterwards long enough exposed to the Sunne, will not shine. That this doth not happen in every Worm, nor in all kinds of Rotten Wood, nor in all Calcined Stones, the cause may be, that the parts of which those Bodies are made, are different both in motion and figure from the parts of Bodies of other kinds.

7 Also the Sea-water shineth when it is either dashed with the strokes of Oares, or when a Ship in its course breaks strongly through it; but more or less according as the Winde blows from different points. The cause whereof may be this, that the particles of salt (though they never shine in the Salt-pits, where they are but slowly drawn up by the Sunne) being here beaten up into the aire in greater quantities, and with more force, are withall made to turn round, and consequently to shine, though weakly. I have therefore given a possible cause of this Phaenomenon.

8 If such matter as is compounded of hard little Bodies, be set on fire, it must needs be, that as they flye out in greater or lesse quantities, the Flame which is made by them, will be greater or less. And if the aethereal or fluid part of that matter fly out together with them, their motion will be the Swifter, as it is in Wood, and other things which flame with a manifest mixture of Winde. When therefore these hard particles by their flying out, move the Eye strongly, they shine bright; and a great quantity of them flying out together, they make a great shining Body. For Flame being nothing but an aggregate of shining particles, the greater the aggregate is, the greater and more manifest will be the Flame. I have therefore shewn a possible cause of Flame. And from hence the cause appears evidently, why Glass is so easily and quickly melted by the small Flame of a candle blown, which will not be melted without blowing, but by a very strong Fire.

Now if from the same matter, there be a part broken off (namely such a part as consisteth of many of the small particles), of this is made a Spark. For from the breaking off, it hath a violent turning round; and from hence it

shines. But though from this matter, there fly neither Flame nor Sparks; yet some of the smallest parts of it may be carried out as farre as to the Superficies, and remain there, as Ashes; the parts whereof are so extremely small, that it cannot any longer be doubted how farre Nature may proceed in Dividing.

Lastly, though by the application of fire to this matter, there fly little or nothing from it, yet there will be in the parts an endeavour to Simple motion; by which the whole Body will either be Melted, or (which is a degree of Melting) Softned. For all Motion has some effect upon all Matter whatsoever (as has been shewn at the 3d Article of the 16th Chapter). Now if it be softned to such a degree, as that the stubbornness of the parts be exceeded by their gravity, then we say it is Melted; otherwise, Softned, and made Pliant and Ductile.

Again, the matter having in it some particles hard, others aethereal or watery, if by the application of fire these later be called out, the former will thereby come to a more full contact with one another; and consequently will not be so easily separated; that is to say, the whole Body will be made Harder. And this may be the cause why the same Fire makes some things Soft, others Hard.

9 It is known by experience, that if Hay be laid wet together in a heap, it will after a time begin to smoke, and then burn as it were of it self. The cause whereof seems to be this, that in the Aire which is enclosed within the Hay, there are those little Bodies, which (as I have supposed) are moved freely with simple Motion. But this Motion being by degrees hindred more and more by the descending moisture, which at the last fills and stops all the passages, the thinner parts of the Aire ascend by penetrating the water; and those hard little Bodies being so thrust together that they touch and press one another, acquire stronger motion, till at last by the increased strength of this motion the watery parts are first driven outwards, from whence appears

Vapour; and by the continued increase of this motion, the smallest particles of the dried Hay are forced out, and recovering their natural simple Motion, they grow Hot and Shine, that is to say, they are set on Fire.

The same also may be the cause of Lightning; which happens in the hottest time of the yeare, when the water is raised up in greatest quantity, and carried highest. For after the first Clouds are raised, others after others follow them; and being congeled above, they happen (whilst some of them ascend and others descend) to fall upon another in such manner, as that in some places all their parts are joyned together, in others they leave hollow Spaces between them; and into these spaces (the aethereall parts being forced out by the compressure of the Clouds) many of the harder little Bodies are so pent together, as that they have not the liberty of such motion as is naturall to the Aire. Wherefore their endeavour growes more vehement, till at last they force their way through the Clouds, sometimes in one place, sometimes in another; and breaking through with great noise, they move the aire violently, & striking our Eies generate Light, that is to say, they Shine. And this Shining is that we call Lightning.

10 The most common Phaenomenon proceeding from Fire, and yet the most admirable of all others, is the force of Gunpowder fired; which being compounded of Niter, Brimstone and Coles beaten small, hath from the Coles its first taking fire; from the Brimstone its nourishment and flame, that is to say, Light and motion; and from the Niter the vehemence of both. Now if a piece of Niter, (before it is beaten) be laid upon a burning Cole, first it melts, and like water quencheth that part of the Cole it toucheth. Then Vapor or Aire flying out where the Cole and Niter joyne, bloweth the Cole with great swiftnesse and vehemence on all sides. And from hence it comes to passe, that by two contrary motions (the one, of the particles which go out of the burning Cole, the other, of those of the aethereall and watery substance of the Niter) is generated that vehement Motion and

Inflammation. And lastly, when there is no more action from the Niter (that is to say, when the volatile parts of the Niter are flown out) there is found about the sides a certain white substance, which being thrown again into the fire, will grow red hot again, but will not be dissipated, at least, unlesse the fire be augmented. If now a possible cause of this be found out, the same will also be a possible cause why a grain of Gunpowder set on fire doth expand it selfe with such vehement motion, and Shine. And it may be caused in this manner.

Let the particles of which Niter consisteth, be supposed to be some of them hard, others watery, and the rest aethereall. Also let the hard particles be supposed to be spherically hollow, like small bubbles, so that many of them growing together may constitute a Body whose little cavernes are filled with a substance which is either watery, or aethereal, or both. As soon therefore as the hard particles are dissipated, the watery and aethereal particles will necessarily fly out; and as they fly, of necessity blow strongly the burning Coles and Brimstone which are mingled together; whereupon there will follow a great expansion of Light, with vehement flame, and a violent dissipation of the particles of the Niter, the Brimstone and the Coles. Wherefore I have given a possible cause of the force of fired Gunpowder.

It is manifest from hence, that for the rendering of the cause why a bullet of lead or iron shot from a peece of Ordnance flies with so great velocity, there is no necessity to introduce such Rarefaction, as (by the common definition of it) makes the same Matter to have sometimes more, sometimes lesse Quantity; which is unconceivable. For every thing is said to be greater or lesse, as it hath more or lesse Quantity. The violence with which a bullet is thrust out of a Gun, proceeds from the swiftnesse of the small particles of the fired Powder; at least it may proceed from that cause without the supposition of any Empty Space.

11 Besides, by the attrition or rubbing of one Body against another, as of Wood against Wood, we find that not only a certaine degree of Heat, but Fire it selfe is sometimes generated. For such motion, is the reciprocation of pressure, sometimes one way sometimes the other; and by this reciprocation, whatsoever is fluid in both the peeces of Wood, is forced hither and thither; and consequently, to an endeavour of getting out; and at last by breaking out makes Fire.

12 Now Light is distinguished into, First, Second, Third, and so on infinitely. And we call that First Light, which is in the first Lucid Bodie; as the Sunne, Fire, &c. Second, that which is in such Bodies as being not transparent are illuminated by the Sunne; as the Moon, a Wall, &c. and Third, that which is in Bodies not transparent but illuminated by Second Light, &c.

13 Colour is Light, but troubled Light; namely, such as is generated by perturbed motion; as shall be made manifest by the Red, Yellow, Blew and Purple which are generated by the interposition of a Diaphanous Prisma (whose opposite bases are triangular) between the Light and that which is enlightened.

For let there be a Prisma of Glasse, or of any other transparent matter which is of greater density then Aire; and let the triangle ABC be the base of this Prisma. Also let the straight line DE be the diameter of the Sunnes Body, having oblique position to the straight line AB; and let the Sunne-beames passe in the lines DA and EBC. And lastly let the straight lines DA and EC be produced indefinitely to F and G. Seeing therefore the straight line DA, by reason of the density of the Glasse is refracted towards the perpendicular; let the line refracted at the point A be the straight line AH. And againe, seeing the Medium below AC is thinner then that above it, the other refraction which will be made there, will diverge from the perpendicular. Let therefore this second refracted line be AI. Also let the

same be done at the point C, by making the first refracted line to be CK, and the second CL. Seeing therefore the cause of the refraction in the point A of the straight line of AB, is the excess of the resistance of the Medium in AB above the resistance of the Aire, there must of necessity be reaction from the point A towards the point B; and consequently the Medium at A within the triangle ABC, will have its motion troubled; that is to say, the straight motion in AF and AH, will be mixed with the transverse motion between the same AF and AH, represented by the short transverse lines in the triangle AFH. Againe, seeing at the point A of the straight line AC, there is a second refraction from AH in AI, the motion of the Medium will again be perturbed by reason of the transverse reaction from A towards C, represented likewise by the short transverse lines in the triangle AHI. And in the same manner there is a double perturbation represented by the transverse lines in the triangles CGK and CKL. But as for the light between AI and CG, it will not be perturbed; because if there were in all the points of the straight lines AB and AC, the same action which is in the points A and C, then the plaine of the triangle CGK would be every where coincident with the plaine of the triangle AFH; by which meanes all would appear alike between A and C. Besides, it is to be observed, that all the reaction at A, tends towards the illuminated parts which are between A and C, and consequently perturbeth the First Light. And on the contrary, that all the reaction at C tends towards the parts without the triangle, or without the Prisma ABC, where there is none but Second Light; and that the triangle AFH shewes that perturbation of Light which is made in the Glasse it selfe; as the triangle AHI shewes that perturbation of Light which is made below the Glasse. In like manner, that CGK shewes the perturbation of Light within the Glasse; and CKL that which is below the Glasse. From whence there are four divers motions, or four different illuminations or Colours; whose differences appear most manifestly to the Sense in a Prisma (whose

base is an equilaterall triangle) when the Sunne-beames that passe through it are received upon a white paper. For the triangle AFH appears Red to the Sense; the triangle AHI Yellow; the triangle CGK Green, and approaching to Blew; and lastly the triangle CKL appears Purple. It is therefore evident, that when weak but First Light passeth through a more resisting diaphanous Body, as Glasse, the beames which fall upon it tranversly, make Rednesse; and when the same First Light is stronger, as it is in the thinner Medium below the straight line AC, the transverse beames make Yellownesse. Also when Second Light is strong, as it is in the triangle CGK (which is nearest to the First Light) the transverse beames make Greenesse; and when the same Second Light is weaker, as in the triangle CKL, they make a Purple colour.

14 From hence may be deduced a cause why the Moon and Starres appear bigger and redder neer the Horizon then in the Mid-heaven. For between the Eie and the apparent Horizon, there is more impure aire, such as is mingled with Watery and Earthy little Bodies, then is between the same Eie and the more elevated part of Heaven. But Vision is made by Beames which constitute a Cone, whose base, if we look upon the Moon, is the Moons Face, and whose vertex is in the Eie; and therefore many beams from the Moon must needs fall upon little Bodies that are without the Visual Cone, and be by them reflected to the Eie. But these reflected beams tend all in lines which are transverse to the Visual Cone, and make at the Eie an angle which is greater then the angle of the Cone. Wherefore the Moon appeares greater in the Horizon, then when she is more elevated. And because those reflected beames go transversely, there will be generated (by the last article) Rednesse. A possible cause therefore is shewne, why the Moon, as also the Starres appear Greater and Redder in the Horizon, then in the midst of heaven. The same also may be the cause why the Sunne appears in the Horizon, Greater, and of a colour more degenerating to

Yellow, then when he is higher elevated. For the reflection from the little Bodies between, and the transverse motion of the Medium are still the same. But the Light of the Sunne is much stronger then that of the Moon; and therefore (by the last article) his Splendor must needs by this perturbation degenerate into Yellownesse.

But for the generation of these four colours, it is not necessary that the figure of the Glass be a Prisma; for if it were Spherical it would doe the same. For in a Sphere the Sunne-beames are twice refracted and twice reflected. And this being observed by Des Cartes; and with all that a Rainebow never appears but when it rains; as also, that the drops of raine have their figures almost Spherical; he hath shewne from thence the cause of the colours in the Rainbow; which therefore need not be repeated.

15 Whiteness is Light; but Light perturbed by the reflexions of many beams of Light comming to the Eye together within a little space. For if Glass, or any other Diaphanous Body be reduced to very small parts by contusion or concussion; every one of those parts (if the Beams of a lucid Body be from any one point of the same reflected to the Eye) will represent to the beholder an Idea or Image of the whole lucid Body, that is to say, a Phantasme of White. For the strongest Light is the most White; and therefore many such parts will make many such Images. Wherefore if those parts lie thick and close together, those many Images will appear confusedly, and will by reason of the confused Light represent a White Colour. So that from hence may be deduced a possible cause, why Glass beaten, that is, reduced to powder, looks White. Also why Water and Snow are White; they being nothing but a heap of very small Diaphanous Bodies, namely, of little Bubbles, from whose several convex Superficies, there are by reflexion made several confused Phantasmes of the whole lucid Body; that is to say, Whiteness. For the same reason, Salt and Nitre are White; as consisting of small Bubbles which contain within them Water and Aire; as

is manifest in Nitre, from this, that being thrown into the fire, it violently blowes the same; which Salt also doth, but with less violence. But if a White Body be exposed, not to the Light of the Day, but to that of the Fire, or of a Candle, it will not at the first sight be easily judged whether it be White or Yellow; the cause whereof may be this, that the light of those things which burn and flame, is almost of a middle Colour between Whiteness and Yellowness.

16 As Whiteness is Light, so Blackness is the privation of Light, or Darkness. And from hence it is; First, that all Holes, from which no light can be reflected to the Eie, appear Black. Secondly, that when a Body hath little eminent particles erected straight up from the Superficies (so that the Beams of Light which fall upon them are reflected, not to the Eie, but to the Body it self) that Superficies appears Black, in the same manner as the Sea appears Black, when ruffled by the Wind. Thirdly, that any combustible matter is by the fire made to look Black before it shines. For the endeavour of the fire being to dissipate the smallest parts of such Bodies as are thrown into it, it must first raise and erect those parts, before it can work their dissipation. If therefore the fire be put out before the parts be totally dissipated, the Cole will appear Black; for the parts being onely erected, the Beams of Light falling upon them will not be reflected to the Eie, but to the Cole it self. Fourthly, that Burning Glasses do more easily burn Black things then White. For in a White Superficies, the eminent parts are convex, like little bubbles; and therefore the Beams of Light which fall upon them are reflected every way from the reflecting Body. But in a Black Superficies, where the eminent particles are more erected, the Beams of Light falling upon them, are all necessarily reflected towards the Body it self; and therefore Bodies that are Black are more easily set on fire by the Sun-beams, then those that are White. Fifthly, that all Colours that are made of the mixture of White and Black, proceed from the different position of

the particles that rise above the Superficies, and their different forms of asperity. For according to these differences, more or fewer Beams of Light are reflected from several Bodies to the Eye. But in regard those differences are innumerable, and the Bodies themselves so small, that we cannot perceive them, the explication and precise determination of the Causes of all Colours is a thing of so great difficulty, that I dare not undertake it.

CHAP. XXVIII. OF COLD, WIND, HARD, ICE, RESTITUTION OF BODIES BENT, DIAPHANOUS, LIGHTNING AND THUNDER; AND OF THE HEADS OF RIVERS.

- 1 WHY BREATH from the same mouth sometimes heats, and sometimes cools.
- 2 Wind, and the Inconstancy of Winds, whence.
- 3 Why there is a constant, though not a great Wind from East to West neer the Equator.
- 4 What is the effect of Aire pent in between the Clouds.
- 5 No change from Soft to Hard, but by motion.
- 6 What is the cause of Cold neer the Poles.
- 7 The cause of Ice; and why the Cold is more remiss in rainy then in clear weather. Why water doth not freeze in deep Wells, as it doth neer the Superficies of the Earth. Why Ice is not so heavy as Water; and why Wine is not so easily frozen as Water.
- 8 Another cause of Hardness from the fuller contact of Atomes. Also how Hard things are broken.
- 9 A third cause of Hardness from Heat.
- 10 A fourth cause of Hardness from the motion of Atomes enclosed in a narrow space.
- 11 How Hard things are Softned.
- 12 Whence proceeds the spontaneous Restitution of things Bent.

13 Diaphanous, and Opacous, what they are, and whence.

14 The cause of Lightning and Thunder.

15 Whence it proceeds that Clouds can fall again, after they are once elevated and frozen.

16 How it could be that the Moon was eclipsed, when she was not diametrically opposite to the Sunne.

17 By what means many Sunnes may appear at once.

18 Of the Heads of Rivers.

1 AS, when the motion of the ambient aethereal substance makes the Spirits and fluid parts of our Bodies tend outwards, we acknowledge Heat; so, by the endeavour inwards of the same spirits and humours, we feel Cold. So that to Cool, is to make the exterior parts of the Body endeavour inwards, by a motion contrary to that of Calefaction, by which the internal parts are called outwards. He therefore that would know the cause of Cold must find by what motion or motions, the exterior parts of any Body endeavour to retire inwards. To begin with those Phaenomena which are the most familiar; There is almost no man but knows, that breath blown strongly, and which comes from the mouth with violence, that is to say, the passage being straight, will Cool the hand; and that the same breath blown gently, that is to say, through a greater aperture, will warm the same. The cause of which Phaenomenon may be this. The breath going out, hath two motions; the one, of the whole and direct, by which the foremost parts of the hand are driven inwards, the other, simple motion of the small particles of the same breath, which (as I have shewn in the 3d Article of the last Chapter) causeth Heat. According therefore as either of these Motions is predominant, so there is the sense sometimes of Cold, sometimes of Heat. Wherefore, when the breath is softly breathed out at a large passage, that

simple Motion which causeth Heat prevaieth, and consequently Heat is felt; and when by compressing the lips the breath is more strongly blown out, then is the direct motion prevalent, which makes us feel Cold. For the direct motion of the breath or aire, is Wind; and all Wind Cools, or diminisheth former heat.

2 And seeing not onely great Wind, but almost any Ventilation and stirring of the Aire, doth refrigerate; the reason of many experiments concerning Cold cannot well be given, without finding first what are the causes of Wind. Now Wind is nothing else but the direct motion of the Aire thrust forwards; which nevertheless, when many Winds concur may be circular, or otherwise indirect, as it is in Whirle-winds. Wherefore in the first place we are to enquire into the Causes of Winds. Wind is Aire moved in a considerable quantity, and that either in the manner of Waves, which is both forwards & also up & down; or else forwards onely.

Supposing therefore the Aire both cleer and calm, for any time how little soever; yet the greater Bodies of the World, being so disposed and ordered as has been said, it will be necessary that a Wind presently arise some where. For seeing that motion of the parts of the Aire which is made by the Simple Motion of the Sunne in his own Epicycle, causeth an exhalation of the particles of water from the Seas and all other moist Bodies, and those particles make Clouds; it must needs follow, that whilst the particles of water pass upwards, the particles of Aire (for the keeping of all Spaces full) be justled out on every side, and urge the next particles, and these the next, till having made their circuit, there comes continually so much Aire to the hinder parts of the Earth, as there went water from before it. Wherefore the ascending Vapours move the Aire towards the sides every way; and all direct motion of the Aire being Wind, they make a Wind. And if this Wind meet often with other Vapours which arise in other places, it is manifest that the force thereof will be augmented, & the way or course of it changed.

Besides, according as the Earth by its diurnal motion turns sometimes the drier, sometimes the moister part towards the Sunne, so sometimes a greater, sometimes a less quantity of Vapours will be raised, that is to say, sometimes there will be a less, sometimes a greater Wind. Wherefore I have rendred a possible cause of such Winds, as are generated by Vapours; and also of their Inconstancy.

From hence it follows, that these Winds cannot be made in any place which is higher then that to which Vapours may ascend. Nor is that incredible which is reported of the highest Mountains, as the Pique of Tenariffe and the Andes of Peru, namely, that they are not at all troubled with these inconstant Winds. And if it were certain, that neither Rain nor Snow were ever seen in the highest tops of those Mountains, it could not be doubted but that they are higher then any place to which Vapours use to ascend.

3 Nevertheless, there may be Wind there, though not that which is made by the ascent of Vapours, yet a less & more constant Wind (like the continued blast of a pair of bellows) blowing from the East. And this may have a double cause; the one, the diurnal motion of the Earth; the other, its simple motion in its own Epicycle. For these Mountains being (by reason of their height) more eminent then all the rest of the parts of the Earth, do by both these Motions drive the Aire from the West Eastwards. To which though the diurnal Motion contribute but little; yet seeing I have supposed that the simple Motion of the Earth in its own Epicycle, makes two revolutions in the same time in which the diurnal Motion makes but one; and that the Semidiameter of the Epicycle is double to the Semidiameter of the diurnal Conversion, the Motion of every point of the Earth in its own Epicycle will have its velocity quadruple to that of the diurnal Motion; so that by both these Motions together, the tops of those Hills will sensibly be moved against the Aire; and consequently a Wind will be felt. For whether

the Air strike the Sentient, or the Sentient the Air, the perception of Motion will be the same. But this Wind, seeing it is not caused by the ascent of Vapours, must necessarily be very Constant.

4 When one Cloud is already ascended into the Aire, if another Cloud ascend towards it, that part of the Aire which is intercepted between them both, must of necessity be pressed out every way. Also when both of them, whilst the one ascends, and the other either stayes, or descends, come to be joyned in such manner as that the aethereal substance be shut within them on every side, it will by this compression also go out by penetrating the Water. But in the mean time, the hard particles which are mingled with the Aire, and are agitated (as I have supposed) with Simple Motion, will not pass through the water of the clouds, but be more straightly compressed within their cavities. And this I have demonstrated at the 4th and 5th Articles of the 22th Chapter. Besides, seeing the Globe of the Earth floateth in the Aire which is agitated by the Sunnes Motion, the parts of the Aire resisted by the Earth, will spread themselves every way upon the Earths Superficies; as I have shewn at the 8th Article of the 21th Chapter.

5 We perceive a Body to be Hard, from this, that when touching it we would thrust forwards that part of the same which we touch, we cannot do it otherwise then by thrusting forwards the whole Body. We may indeed easily and sensibly thrust forwards any particle of the Aire or Water which we touch, whilst yet the rest of its parts remain (to sense) unmoved. But we cannot do so to any part of a stone. Wherefore I define a Hard Body to be that, whereof no part can be sensibly moved, unless the whole be moved. Whatsoever therefore is Soft or Fluid, the same can never be made Hard but by such motion, as makes many of the parts together stop the motion of some one part, by resisting the same.

6 These things premised, I shall shew a possible cause why there is greater Cold neer the Poles of the Earth, then further from them. The

motion of the Sunne between the Tropicks, driving the Aire towards that part of the Earths Superficies which is perpendicularly under it, makes it spread it self every way; and the velocity of this expansion of the Aire grows greater and greater, as the Superficies of the Earth comes to be more and more straightned, that is to say, as the Circles which are parallel to the Aequator come to be less and less. Wherefore this expansive motion of the Aire, drives before it the parts of the Aire which are in its way continually towards the Poles more and more strongly, as its force comes to be more and more united, that is to say, as the Circles which are parallel to the Aequator are less and less; that is, so much the more, by how much they are neerer to the Poles of the Earth. In those places therefore which are neerer to the Poles, there is greater Cold, then in those which are more remote from them. Now this expansion of the Aire upon the Superficies of the Earth from East to West, doth by reason of the Sunnes perpetual accession to the places which are successively under it, make it Cold at the time of the Sunnes Rising and Setting; but as the Sunne comes to be continually more and more perpendicular to those cooled places, so by the Heat which is generated by the supervening Simple Motion of the Sunn, that Cold is again remitted; and can never be great, because the action by the which it was generated, is not permanent. Wherefore I have rendred a possible cause of Cold in those places that are neer the Poles, or where the obliquity of the Sunne is great.

7 How Water may be congeled by Cold, may be explained in this manner. Let A (in the first figure) represent the Sunne, and B the Earth. A will therefore be much greater then B. Let EF be in the plain of the Equinoctial; to which let GH, IK and LC be parallel. Lastly, let C and D be the Poles of the Earth. The Aire therefore by its action in those parallels will rake the Superficies of the Earth; and that with motion so much the stronger, by how much the parallel Circles towards the Poles grow less and

less. From whence must arise a Wind, which will force together the uppermost parts of the water, and withal raise them a little, weakning their endeavour towards the Center of the Earth. And from their endeavour towards the center of the Earth, joyned with the endeavour of the said Wind, the uppermost parts of the water will be pressed together, and coagulated, that is to say, the top of the water will be skinned over and hardned. And so againe the Water next the top will be hardned in the same manner, till at length the Ice be thick. And this Ice being now compacted of little hard Bodies, must also containe many particles of ayre received into it.

As Rivers and Seas, so also in the same manner may the Clouds be frozen. For when by the ascending and descending of severall Clouds at the same time, the Air intercepted between them is by compression forced out, it rakes, & by little & little hardens them. And though those smal drops (which usually make Clouds) be not yet united into greater Bodies, yet the same Wind will be made; & by it, as water is congeled into Ice, so will Vapours in the same manner be congeled into Snow. From the same cause it is that Ice may be made by art, and that not farre from the fire. For it is done by the mingling of Snow and Salt together, and by burying in it a small vessell full of Water. Now while the Snow and Salt (which have in them a great deale of aire) are melting, the aire which is pressed out every way in Wind, rakes the sides of the Vessel; and as the Wind by its motion rakes the Vessel, so the Vessel by the same motion and action congeles the Water within it.

We find by experience, that Cold is allwayes more Remisse in places where it raynes, or where the weather is cloudy (things being alike in all other respects) then where the aire is cleare. And this agreeth very well with what I have sayd before. For in cleare weather, the course of the Wind which (as I sayd even now) rakes the Superficies of the Earth, as it is free from all interruption, so also it is very strong. But when small drops of

water are either rising or falling, that Wind is repelled, broken and dissipated by them; and the lesse the Wind is, the lesse is the Cold.

We find also by experience, that in deep Wells the Water freezeth not so much, as it doth upon the Superficies of the Earth. For the Wind by which Ice is made, entring into the Earth (by reason of the laxity of its parts) more or lesse, loseth some of its force, though not much. So that if the Well be not deep, it will freeze; whereas if it be so deep, as that the Wind which causeth cold cannot reach it, it will not freeze.

We find moreover by experience, that Ice is lighter then Water. The cause whereof is manifest from that which I have already shewn, namely, that Aire is received in and mingled with the particles of the Water whilst it is in congeling.

8 We have seen one way of making things Hard, namely, by Congelation. Another way is thus. Having already supposed, that innumerable Atomes, some harder then others, and that have several simple motions of their own, are intermingled with the aethereal substance; it follows necessarily from hence, that by reason of the fermentation of the whole Aire (of which I have spoken in the 21 Chap.) some of those Atomes meeting with others, will cleave together, by applying themselvs to one another in such manner as is agreeable to their motions and mutual contacts; and (seeing there is no Vacuum) cannot be pulled asunder, but by so much force as is sufficient to overcome their Hardness.

Now there are innumerable degrees of Hardness. As (for example) there is a degree of it in Water, as is manifest from this, that upon a plain it may be drawn any way at pleasure by ones finger. There is a greater degree of it in clammy liquors; which when they are poured out, doe in falling downwards dispose themselves into one continued thred; which thred before it be broken will by little and little diminish its thickness, till at last it be so small, as that it seems to break onely in a point; and in their separation

the external parts break first from one another, and then the more internal parts successively one after another. In Wax there is yet a greater degree of Hardness. For when we would pull one part of it from another, we first make the whole mass slenderer, before we can pull it asunder. And how much the harder anything is which we would break, so much the more force we must apply to it. Wherefore, if we go on to harder things, as Ropes, Wood, Metals, Stones, &c. reason prompteth us to believe that the same (though not alwayes sensibly) will necessarily happen; and that even the hardest things are broken asunder in the same manner, namely, by Solution of their continuity, begun in the outermost Superficies, and proceeding successively to the innermost parts. In like manner, when the parts of Bodies are to be separated, not by pulling them asunder, but by breaking them, the first separation will necessarily be in the convex Superficies of the bowed part of the Body, and afterwards in the concave Superficies. For in all bowing, there is in the convex Superficies an endeavour in the parts to go one from another, and in the concave Superficies to penetrate one another.

This being well understood, a reason may be given, how two Bodies which are contiguous in one common Superficies, may by force be separated without the introduction of Vacuum; though Lucretius thought otherwise, believing that such separation was a strong establishment of Vacuum. For a Marble Pillar being made to hang by one of its bases, if it be long enough it will by its own weight be broken asunder, and yet it will not necessarily follow that there should be Vacuum, seeing the solution of its continuity may begin in the Circumference, and proceed successively to the midst thereof.

Lastly, Wine is not so easily congeled as Water, because in Wine there are particles which being not fluid, are moved very swiftly, and by their motion congelation is retarded; but if the Cold prevail against this motion,

then the outermost parts of the Wine will be first frozen, and afterwards the inner parts; whereof this is a signe, that the Wine which remains unfrozen in the midst will be very strong.

9 Another cause of Hardness in some things may be in this manner. If a soft Body consist of many hard particles, which by the intermixture of many other fluid particles cohaere but loosely together, those fluid parts (as hath been shewn in the last Article of the 21 Chapter) will be exhaled; by which means each hard particle will apply it self to the next to it according to a greater Superficies; and consequently they will cohaere more closely to one another; that is to say, the whole mass will be made Harder.

10 Again, in some things Hardness may be made to a certain degree, in this manner. When any fluid substance hath in it certain very small Bodies intermingled, which being moved with simple motion of their own, contribute like motion to the parts of the fluid substance, and this be done in a small enclosed space (as in the hollow of a little Sphere, or a very slender Pipe) if the motion be vehement, and there be a great number of these small enclosed Bodies, two things will happen; the one, that the fluid substance will have an endeavour of dilating it self at once every way; the other, that if those smal Bodies can no where get out, then from their reflexion it will follow, that the motion of the parts of the enclosed fluid substance, which was vehement before, will now be much more vehement. Wherefore if any one particle of that fluid substance should be touched & pressed by some external Movent, it could not yeild but by the application of very sensible force. Wherefore the fluid substance which is enclosed, and so moved, hath some degree of Hardness. Now greater and less degree of Hardness depends upon the quantity and velocity of those small Bodies and upon the narrowness of the place both together.

11 Such things as are made Hard by sudden heat, namely, such as are hardned by fire, are commonly reduced to their former soft form by

Maceration. For fire hardens by Evaporation, and therefore if the evaporated moisture be restored again, the former nature and form is restored together with it. And such things as are frozen with Cold, if the Wind by which they were frozen change into the opposite quarter, they will be unfrozen again (unless they have gotten a habit of new motion or endeavour by long continuance in that hardness). Nor is it enough to cause thawing, that there be a cessation of the freezing Wind (for the taking away of the Cause doth not destroy a produced effect); but the thawing also must have its proper cause, namely, a contrary Wind, or at least a Wind opposite in some degree. And this we finde to be true by experience. For if Ice be laid in a place so well enclosed that the motion of the Aire cannot get to it, that Ice will remain unchanged, though the place be not sensibly cold.

12 Of Hard Bodies, some may manifestly be bowed; others not, but are broken in the very first moment of their bending. And of such Bodies as may manifestly be bended, some being bent, do as soon as ever they are set at liberty, Restore themselves to their former posture, others remain still bent. Now if the cause of this Restitution be asked, I say it may be in this manner; namely, that the particles of the bended Body, whilst it is held bent, do nevertheless retain their motion; and by this motion they restore it as soon as the force is removed by which it was bent. For when any thing is bent (as a plate of steel), and as soon as the force is removed restores it self again, it is evident that the cause of its restitution cannot be referred to the ambient aire; nor can it be referred to the removal of the force by which it was bent; for in things that are at rest, the taking away of impediments, is not a sufficient cause of their future Motion; there being no other cause of Motion, but Motion. The cause therefore of such Restitution is in the parts of the Steel it self. Wherefore whilst it remains bent, there is in the parts of which it consisteth, some motion, though invisible, that is to say, some endeavour at least that way by which the restitution is to be made; and

therefore this endeavour of all the parts together is the first beginning of Restitution; so that the impediment being removed, that is to say, the force by which it was held bent, it will be restored again. Now the motion of the parts by which this is done, is that which I called Simple Motion, or Motion returning into it self. When therefore in the bending of a plate, the ends are drawn together, there is on one side a mutual compression of the parts; which compression is one endeavour opposite to another endeavour; and on the other side a divulsion of the parts. The endeavour therefore of the parts on one side tends to the restitution of the plate from the middle towards the ends; and on the other side, from the ends towards the middle. Wherefore the impediment being taken away, this endeavour (which is the beginning of restitution) will restore the plate to its former posture. And thus I have given a possible cause why some Bodies when they are bent Restore themselves again; which was to be done.

As for Stones, seeing they are made by the accretion of many very hard particles within the Earth; which particles have no great coherence, that is to say, touch one another in small latitude, and consequently admit many particles of aire, it must needs be that in bending of them, their internal parts will not easily be compressed by reason of their hardness. And because their coherence is not firm, as soon as the external hard particles are disjoyned, the aethereal parts will necessarily break out, and so the Body will suddenly be broken.

13 Those Bodies are called Diaphanous, upon which whilst the Beams of a lucid Body do work, the action of every one of those Beams is propagated in them in such manner as that they still retain the same order amongst themselves, or the inversion of that order; and therefore Bodies which are perfectly Diaphanous, are also perfectly homogeneous. On the contrary, an Opacous Body is that, which by reason of its heterogeneous nature, doth by innumerable reflexions and refractions in particles of

different figures and unequal hardness, weaken the Beams that fall upon it before they reach the Eie. And of Diaphanous Bodies, some are made such by Nature from the beginning; as the substance of the Aire, and of the Water, and perhaps also some parts of Stones, unless these also be Water that has been long congeled. Others are made so by the power of Heat, which congregates homogeneous Bodies. But such as are made Diaphanous in this manner, consist of parts which were formerly Diaphanous.

14 In what manner Clouds are made by the motion of the Sunne, elevating the particles of Water from the Sea and other moist places, hath been explained in the 26th Chapter. Also how Clouds come to be frozen, hath been shewn above at the 7th Article. Now from this, that Aire may be enclosed, as it were in Caverns, and pent together more and more by the meeting of ascending and descending Clouds, may be deduced a possible Cause of Thunder and Lightening. For seeing the Aire consists of two parts, the one Aethereal, which has no proper motion of its own, as being a thing divisible into the least parts; the other Hard, namely, consisting of many hard Atomes which have every one of them a very swift simple motion of its own; whilst the Clouds by their meeting do more and more straighten such Cavities as they intercept, the Aethereal parts will penetrate and pass through their watry substance; but the hard parts will in the mean time be the more thrust together, and press one another; and consequently (by reason of their vehement motions) they will have an endeavour to rebound from each other. Whensoever therefore the compression is great enough, and the concave parts of the Clouds are (for the cause I have already given) congeled into Ice, the Cloud wil necessarily be broken; & this breaking of the Cloud produceth the first clap of Thunder. Afterwards, the Aire which was pent in, having now broken through, makes a concussion of the Aire without; and from hence proceeds the roaring and murmur which follows; and both the first Clap and the Murmur that follows it, make that noise

which is called Thunder. Also from the same Aire breaking through the Clouds, and with concussion falling upon the Eie, proceeds that action upon our Eie, which causeth in us a perception of that Light which we call Lightening. Wherefore I have given a possible cause of Thunder and Lightening.

15 But if the Vapours which are raised into Clouds, do run together again into Water, or be congeled into Ice, from whence is it (seeing both Ice and Water are heavy) that they are sustained in the Aire? Or rather, what may the cause be, that being once elevated, they fall down again? For there is no doubt but the same force which could carry up that Water, could also sustain it there. Why therefore being once carried up, doth it fall again? I say it proceeds from the same Simple Motion of the Sunne, both that Vapours are forced to ascend, and that Water gathered into Clouds is forced to descend. For in the 21th Chapter and 11th Article I have shewn how Vapours are elevated; and in the same Chapter and 5th Article I have also shewn how by the same motion Homogeneous Bodies are congregated, & Heterogeneous dissipated; that is to say, how such things as have a like nature to that of the Earth, are driven towards the Earth; that is to say, what is the cause of the descent of Heavy Bodies. Now if the action of the Sun be hindered in the raising of vapours, and be not at all hindered in the casting of them down, the Water will descend. But a Cloud cannot hinder the action of the Sunne in making things of an earthly nature descend to the Earth, though it may hinder it in making Vapours ascend For the lower part of a thick Cloud is so covered by its upper part, as that it cannot receive that action of the Sunne by which Vapours are carried up, because Vapours are raised by the perpetual fermentation of the Aire, or by the separating of its smallest parts from one another, which is much weaker when a thick Cloud is interposed, then when the Skie is cleere. And therefore whensoever a Cloud is made thick enough, the water which would not descend before, will then descend,

unless it be kept up by the agitation of the Winde. Wherefore I have rendred a possible cause, both why the Clouds may be sustained in the Aire, and also why they may fall down again to the Earth; which was propounded to be done.

16 Granting that the Clouds may be frozen, it is no wonder if the Moon have been seen eclipsed at such time as she hath been almost two degrees above the Horizon, the Sunne at the same time appearing in the Horizon; for such an Eclipse was observed by Mestline at Tubing in the year 1590. For it might happen that a frozen Cloud was then interposed between the Sunne and the Eie of the Observer. And if it were so, the Sunne which was then almost two Degrees below the Horizon, might appear to be in it, by reason of the passing of his Beams through the Ice. And it is to be noted, that those that attribute such refractions to the Atmosphere, cannot attribute to it so great a refraction as this. Wherefore not the Atmosphere, but either Water in a continued Body, or else Ice must be the cause of that refraction.

17 Again, granting that there may be Ice in the Clouds, it will be no longer a wonder that many Sunnes have sometimes appeared at once. For Looking-glasses may be so placed, as by reflections to shew the same object in many places. And may not so many frozen Clouds serve for so many Looking-glasses? and may they not be fitly disposed for that purpose? Besides, the number of Appearances may be encreased by refractions also; and therefore it would be a greater wonder to me, if such Phaenomena as these should never happen.

And were it not for that one Phaenomenon of the new Starre which was seen in Cassiopaea, I should think Comets were made in the same manner, namely, by Vapours drawn not onely from the Earth, but from the rest of the Planets also, and congeled into one continued Body. For I could very well from hence give a reason both of their Haire, and of their motions. But seeing that Starre remained sixteen whole moneths in the same place

amongst the fixed Starres, I cannot believe the matter of it was Ice. Wherefore I leave to others, the disquisition of the cause of Comets; concerning which, nothing that hath hitherto been published, (the bare Histories of them) is worth considering.

18 The Heads of Rivers may be deduced from Rain-water, or from melted Snowes, very easily; but from other causes, very hardly, or not at all. For both Rain-water, and melted Snowes run down the descents of Mountains; and if they descend onely by the outward Superficies, the Showres or Snowes themselves may be accounted the Springs or Fountains; but if they enter the Earth & descend within it, then wheresoever they break out, there are their Springs. And as these Spings make small streams, so, many small streams running together make Rivers. Now there was never any Spring found, but where the Water w^{ch} flowed to it, was either further, or at least as farre from the center of the Earth, as the Spring it self. And whereas it has bin objected by a great Philosopher, that in the top of Mount-Cenis (which parts Savoy from Piemont) there Springs a River which runs down by Susa; it is not true. For there are above that River, for two miles length, very high hils on both sides, which are almost perpetually covered with Snow; from which, innumerable little streams running down do manifestly supply that River with water sufficient for its magnitude.

CHAP. XXIX. OF SOUND, ODOUR, SAVOUR, AND TOUCH

- 1 THE DEFINITION of Sound, and the distinctions of Sounds.
- 2 The cause of the degrees of Sounds.
- 3 The difference between Sounds Acute and Grave.
- 4 The difference between Clear and Hoarse Sounds, whence.
- 5 The Sound of Thunder and of a Gunne, whence it proceeds.
- 6 Whence it is, that Pipes by blowing into them have a clear Sound.
- 7 Of Reflected Sound.
- 8 From whence it is that Sound is Uniform and Lasting.
- 9 How Sound may be helped aud hindered by the Wind.
- 10 Not onely Aire, but other Bodies how hard soever they be, convey Sound.
- 11 The causes of Grave and Acute Sounds, and of Concent.
- 12 Phaenomena for Smelling.
- 13 The first Organ and the generation of Smelling.
- 14 How it is helped by Heat and by Wind.
- 15 Why such Bodies are least smelt, which have least intermixture of Aire in them.

16 Why Odorous things become more Odorous by being bruised.

17 The first Organ of Tasting; and why some Savours cause Nauseousness.

18 The first Organ of Feeling; and how we come to the knowledge of such Objects as are common to the Touch and other Senses.

SOUND is Sense generated by the action of the Medium, when its motion reacheth the Eare and the rest of the Organs of Sense. Now the motion of the Medium is not the Sound it self, but the cause of it. For the Phantasme which is made in us, that is to say, the Reaction of the Organ is properly that which we call Sound.

The principal distinctions of Sounds are these; First, that one Sound is stronger, another Weaker. Secondly, that one is more Grave, another more Acute. Thirdly, that one is Clear, another Hoarse. Fourthly, that one is Primary, another Derivative. Fifthly, that one is Uniform, another not. Sixthly, that one is more Durable, another less Durable. Of all which distinctions the members may be subdistinguished into parts distinguishable almost infinitely. For the variety of Sounds seems to be not much less then that of Colours.

As Vision, so Hearing is generated by the motion of the Medium, but not in the same manner. For Sight is from Pressure, that is, from an Endeavour; in which there is no perceptible progression of any of the parts of the Medium; but one part urging or thrusting on an other, propagateth that action successively to any distance whatsoever; whereas the motion of the Medium by which Sound is made, is a Stroke. For when we Hear, the Drumme of the Eare (which is the first Organ of Hearing) is stricken; and the Drumme being stricken, the Pia Mater is also shaken, and with it the Arteries which are inserted into it; by which the action being propagated to the Heart it self, by the reaction of the Heart a Phantasm is made which we

call Sound; and (because the reaction tendeth outwards) we think it is without.

2 And seeing the effects produced by Motion, are greater or lesse, not onely when the Velocity is greater or less, but also when the Body hath greater or less Magnitude though the Velocity be the same; a Sound may be greater or lesse both these wayes. And because neither the greatest nor the least Magnitude or Velocity can be given, it may happen, that either the motion may be of so small velocity, or the Body it self of so small magnitude, as to produce no Sound at all; or either of them may be so great, as to take away the Faculty of Sense by hurting the Organ.

From hence may be deduced possible causes of the strength and weakness of Sounds in the following Phaenomena.

The first whereof is this, That if a man speak through a Trunk which hath on end applyed to the mouth of the Speaker, and the other to the eare of the Hearer, the Sound will come stronger then it would do through the open Aire. And the cause (not onley the possible, but the certain and manifest cause) is this, that the Aire which is moved by the first breath, and carried forwards in the Trunk, is not diffused, as it would be in the open Aire, and is consequently brought to the eare almost with the same velocity with which it was first breathed out; Whereas in the open Aire, the first motion diffuseth it self every way into Circles, such as are made by the throwing of a Stone into a standing water, where the velocity grows less and less as the Undulation proceeds further and further from the beginning of its motion.

The second is this, That if the Trunk be short, and the end which is applyed to the mouth be wider then that which is applyed to the eare, thus also the Sound will be stronger then if it were made in the open aire. And the cause is the same, namely, that by how much the wider end of the Trunk is less distant from the beginning of the Sound, by so much the less is the diffusion.

The third, That it is easier for one that is within a Chamber, to heare what is spoken without, then for him that stands without, to hear what is spoken within. For the Windows and other inlets of the moved Aire, are as the wide end of the Trunk. And for this reason some creatures seem to hear the better, because Nature has bestowed upon them wide and capacious Ears.

The fourth is this, That though he which standeth upon the Sea shore, cannot heare the Collision of the two neerest waves, yet nevertheless he hears the roaring of the whole Sea. And the cause seems to be this, that though the several collisions move the Organ, yet they are not severally great enough to cause Sense; whereas nothing hinders but that all of them together may make Sound.

3 That Bodies when they are stricken do yeild some a more Grave, others a more Acute Sound, the cause may consist in the difference of the times in which the parts stricken and forced out of their places, return to the same places again. For in some Bodies, the restitution of the moved parts is quick, in others slow. And this also may be the cause why the parts of the Organ which are moved by the Medium, return to their rest again, sometimes sooner, sometimes later. Now by how much the Vibrations, or the reciprocal motions of the parts are more frequent, by so much doth the whole Sound made (at the same time) by one stroke, consist of more, and consequently of smaller parts. For what is Acute in Sound, the same is Subtle in Matter; and both of them, namely, Acute Sound, and Subtle Matter consist of very small parts, that of Time, and this of the Matter it self.

The third distinction of Sounds cannot be conceived clearly enough by the names I have used of Clear and Hoarse, nor by any other that I know; and therefore it is needful to explain them by examples. When I say Hoarse, I understand Whispering and Hissing, and whatsoever is like to these, by

what appellation soever it be expressed. And Sounds of this kind seem to be made by the force of some strong Wind, raking rather than striking such hard Bodies, as it falls upon. On the contrary, when I use the word Clear, I do not understand such a Sound as may be easily and distinctly heard, for so Whispers would be Clear, but such as is made by somewhat that is Broken; and such as is Clamor, Tinkling, the Sound of a Trumpet, &c. and (to express it significantly in one word), Noise. And seeing no Sound is made but by the concurrence of two Bodies at the least, by which concurrence it is necessary that there be as well Reaction as Action, that is to say, one motion opposite to another; it follows, that according as the proportion between those two opposite motions is diversified, so the Sounds which are made will be different from one another. And whensoever the proportion between them is so great, as that the motion of one of the Bodies be insensible if compared with the motion of the other, then the Sound will not be of the same kind; as when the Wind falls very obliquely upon a hard Body, or when a hard Body is carried swiftly through the Aire; for then there is made that Sound which I call a Hoarse Sound, in Greek . Therefore the breath blown with violence from the mouth makes a Hissing, because in going out it rakes the Superficies of the Lips, whose reaction against the force of the breath is not Sensible. And this is the cause why the Winds have that Hoarse Sound. Also if two Bodies how hard soever, be rubbed together with no great pressure, they make a Hoarse Sound. And this Hoarse Sound when it is made (as I have said) by the Aire raking the Superficies of a hard Body, seemeth to be nothing but the dividing of the Aire into innumerable and very small Files. For the asperity of the Superficies doth by the eminencies of its innumerable parts divide or cut in pieces the Aire that slides upon it.

4 Noise, or that which I call Clear Sound, is made two wayes; one, by two Hoarse Sounds, made by opposite motions; the other, by Collision, or by the suddain pulling asunder of two Bodies, whereby their small particles

are put into commotion, or being already in commotion, suddenly restore themselves again; which motion making impression upon the Medium, is propagated to the Organ of Hearing. And seeing there is in this Collision, or divulsion, an endeavour in the particles of one Body, opposite to the endeavour of the particles of the other Body, there will also be made in the Organ of Hearing a like opposition of endeavours, that is to say, of motions; and consequently the Sound arising from thence, will be made by two opposite motions, that is to say, by two opposite Hoarse Sounds in one and the same part of the Organ. For (as I have already said) a Hoarse Sound supposeth the sensible motion of but one of the Bodies. And this opposition of motions in the Organ is the cause why two Bodies make a Noyse, when they are either suddenly stricken against one another, or suddenly broken asunder.

5 This being granted; and seeing withall, that Thunder is made by the vehement eruption of the Aire out of the cavities of congeled Clouds; the cause of the great Noyse or Clap, may be the suddain breaking asunder of the Ice. For in this action it is necessary, that there be not onely a great concussion of the small particles of the broken parts, but also that this Concussion (by being communicated to the Aire) be carried to the Organ of Hearing, & make impression upon it. And then, from the first reaction of the Organ proceeds that first and greatest Sound, which is made by the collision of the parts whilst they restore themselves. And seeing there is in all Concussion a reciprocation of Motion forwards and backwards in the parts stricken, (for opposite motions cannot extinguish one another in an instant, as I have shewn in the 11th Art. of the 8th Chap.) it follows necessarily, that the Sound will both continue, and grow weaker and weaker, till at last the action of the reciprocating aire grow so weak, as to be unperceptible. Wherefore a possible cause is given both of the first fierce Noyse of the Thunder; and also of the Murmur that follows it.

The cause of the great Sound from a discharged piece of Ordnance, is like that of a Clap of Thunder. For the Gunpowder being fired, doth in its endeavour to go out, attempt every way the sides of the metal in such manner, as that it enlargeth the Circumference all along, and withall shortneth the axis; so that whilst the peece of Ordnance is in discharging, it is made both wider and shorter then it was before; and therefore also presently after it is discharged its wideness will be diminished, and its length encreased again by the restitution of all the particles of the matter of which it consisteth to their former position. And this is done with such motion of the parts, as are not onely very vehement, but also opposite to one another; which motions being communicated to the Aire, make impression upon the Organ, and by the reaction of the Organ create a Sound; which lasteth for some time, as I have already shewn in this Article.

I note by the way (as not belonging to this place) that the possible cause why a Gun recoyles when it is shot off, may be this; That being first swoln by the force of the fire, and afterwards restoring it self; from this restitution there proceeds an endeavour from all the sides towards the cavity; and consequently this endeavour is in those parts which are next the breech; which being not hollow, but solid, the effect of the restitution is by it hindered and diverted into the length; and by this means both the breech and the whole Gun is thrust backwards; and the more forcibly by how much the force is greater by which the part next the breech is restored to its former posture; that is to say, by how much the thinner is that part. The cause therefore why Gunnes recoyle, some more, some less, is the difference of their thickness towards the breech; & the greater that thickness is, the less they recoil; and contrarily.

6 Also the cause why the Sound of a Pipe, which is made by blowing into it, is nevertheless Clear, is the same with that of the Sound which is made by collision. For if the breath when it is blown into a Pipe doe onely

rake its concave Superficies, or fall upon it with a very sharp angle of incidence, the Sound will not be Clear, but Hoarse. But if the angle be great enough, the percussion which is made against one of the hollow sides, will be reverberated to the opposite side; and so successive repercussions will be made from side to side, till at last the whole concave Superficies of the Pipe be put into motion; which motion will be reciprocated, as it is in Collision; and this reciprocation being propagated to the Organ, from the reaction of the Organ will arise a Cleare Sound, such as is made by Collision, or by breaking asunder of hard Bodies.

In the same manner it is with the Sound of a Mans voice. For when the breath passeth out, without interruption, and doth but lightly touch the cavities through which it is sent, the Sound it maketh is a Hoarse Sound. But if in going out it strike strongly upon the Larinx, then a Clear Sound is made, as in a Pipe. And the same breath, as it comes in divers manners to the Palate, the Tongue, the Lips, the Teeth, and other Organs of Speech, so the Sounds into which it is articulated become different from one another.

7 I call that Primary Sound, which is generated by motion from the sounding Body to the Organ in a straight line without reflexion; and I call that Reflected Sound, which is generated by one or more reflexions; being the same with that we call Echo; and is iterated as often as there are reflexions made from the Object to the Eare. And these reflexions are made by Hills, Wals, and other resisting Bodies, so placed, as that they make more or fewer reflexions of the motion, according as they are themselves more or fewer in number; and they make them more or less frequently, according as they are more or less distant from one another. Now the cause of both these things is to be sought for in the situation of the reflecting Bodies, as is usually done in Sight. For the Lawes of Reflexion are the same in both, namely, that the Angles of Incidence and Reflexion be equal to one another. If therefore in a hollow Elliptique Body whose inside is well polished, or in

two right Parabolical Solids which are joyned together by one common base, there be placed a Sounding Body in one of the Burning Points, & the Ear in the other, there will be heard a Sound by many degrees greater then in the open Aire; and both this, and the burning of such combustibile things, as being put in the same places are set on fire by the Sun-beams, are effects of one and the same cause. But as when the visible Object is placed in one of the Burning Points, it is not distinctly seen in the other, because every part of the Object being seen in every line which is reflected from the Concave Superficies to the Eie, makes a confusion in the Sight; so neither is Sound heard articulately and distinctly when it comes to the Eare in all those reflected lines. And this may be the reason, why in Churches which have arched rooffs, though they be neither Elliptical nor Parabolical; yet because their figure is not much different from these, the voice from the Pulpit will not be heard so articulately as it would be if there were no vaulting at all.

8 Concerning the Uniformity and Duration of Sounds, both which have one common cause, we may observe, that such Bodies as being stricken yeild an unequal or harsh Sound, are very heterogeous, that is to say, they consist of parts which are very unlike both in figure and hardness, such as are Wood, Stones, and others not a few. When these are stricken, there follows a concussion of their internal particles, and a restitution of them again. But they are neither moved alike, nor have they the same action upon one another; some of them recoyling from the stroke whilst others which have already finished their recoylings are now returning; by which means they hinder and stop on another. And from hence it is that their motions are not only unequal and harsh, but also that their reciprocations come to be quickly extinguished. Whensoever therefore this motion is propagated to the Eare, the Sound it makes is Unequal and of small Duration. On the contrary, if a Body that is stricken, be not onely sufficiently hard, but have also the

particles of which it consisteth like to one another both in hardness and figure, (such as are the particles of Glass and Metals, which being first melted do afterwards settle and harden) the Sound it yeildeth, will (because the motions of its parts and their reciprocations are like and Uniform) be Uniform and pleasant, and be more or less Lasting according as the Body stricken hath greater or less magnitude. The possible cause therefore of Sounds Uniform, and Harsh, and of their longer or shorter Duration, may be one and the same likeness and unlikeness of the internal parts of the Sounding Body, in respect both of their figure and hardness.

Besides, if two plain Bodies of the same matter, and of equal thickness, do both yeild an Uniform Sound, the Sound of that Body which hath the greatest extent of length will be the longest heard. For the motion which in both of them hath its beginning from the point of percussion, is to be propagated in the greater Body through a greater Space, and consequently that propagation will require more time; and therefore also the parts which are moved will require more time for their return. Wherefore all the reciprocations cannot be finished but in longer time; and being carried to the Eare, will make the Sound last the longer. And from hence it is manifest, that of hard Bodies which yeild an Uniform Sound, the Sound lasteth longer which comes from those that are round and hollow, then from those that are plain, if they be like in all other respects. For in circular lines the action which begins at any point, hath not from the figure any end of its propagation, because the line in which it is propagated returns again to its beginning; so that the figure hinders not but that the motion may have infinite progression; whereas in a plain, every line hath its magnitude finite, beyond which the action cannot proceed. If therefore the matter be the same, the motion of the parts of that Body whose figure is round and hollow, wil last longer, then of that which is plain.

Also, if a string which is stretched, be fastned at both ends to a hollow Body, and be stricken, the Sound will last longer then if it were not so fastned; because the trembling or reciprocation which it receives from the stroke, is by reason of the connexion communicated to the hollow Body; and this trembling, if the hollow Body be great, will last the longer by reason of that greatness. Wherefore also (for the reason above mentioned) the Sound will last the longer.

9 In Hearing, it happens (otherwise then in Seeing) that the action of the Medium is made stronger by the Wind when it blows the same way, and weaker when it blows the contrary way. The cause whereof cannot proceed from any thing but the different generation of Sound and Light. For in the generation of Light, none of the parts of the Medium between the object and the Eie are moved from their own places to other places sensibly distant; but the action is propagated in spaces imperceptible; so that no contrary Wind can diminish, nor favourable Winde encrease the Light, unless it be so strong as to remove the Object further off, or bring it nearer to the Eie. For the Wind, that is to say, the aire moved, doth not by its interposition between the object and the eie, worke otherwise then it would doe if it were stil and calme. For where the pressure is perpetuall, one part of the aire is no sooner carried away, but another by succeeding it receives the same impression which the part carried away had received before. But in the generation of Sound, the first collision or breaking asunder, beateth away & driveth out of its place the nearest part of the aire, and that to a considerable distance, and with considerable velocity; and as the circles grow (by their remotenesse) wider and wider, so the aire being more & more dissipated, hath also its motion more & more weakned. Whensoever therfore the air is so stricken as to cause Sound, if the Wind fall upon it, it will move it all, neerer to the Eare if it blow that way, and further from it if it blow the contrary way; so that according as it blowes from or towards the Object, so

the Sound which is heard will seeme to come from a neerer or remoter place; and the action by reason of the unequall distances be strengthened or debilitated.

From hence may be understood the reason, why the voice of such as are said to speake in their bellies, though it be uttered neer hand, is neverthelesse heard by those that suspect nothing, as if it were a great way off. For having no former thought of any determined place from which the voice should proceed, and judging according to the greatest, if it be weake they thinke it a great way off, if strong neer. These Ventriloqui therefore by forming their voice, not (as others) by the emission of their breath, but by drawing it inwards, doe make the same appear small and weake; which weaknesse of the voice deceives those that neither suspect the artifice, nor observe the endeavour which they use in speaking; and so instead of thinking it weake they thinke it farre off.

10 As for the Medium which conveighs Sound, it is not Aire onely. For Water, or any other Body how hard soever may be that Medium. For the Motion may be propagated perpetually in any hard continuous Body; but by reason of the difficulty with which the parts of hard Bodies are moved, the motion in going out of hard matter makes but a weak impression upon the Aire. Nevertheless if one end of a very long and hard beam be stricken, & the eare be applyed at the same time to the other end, so that when the action goeth out of the beam, the aire which it striketh may immediately be received by the eare, and be carried to the Tympanum, the Sound will be considerably strong.

In like manner, if in the night (when all other noyse, which may hinder Sound, ceaseth) a man lay his eare to the ground, he will hear the Sound of the steps of Passengers, though at a great distance; because the motion which by their treading they communicate to the earth, is propagated to the eare by the uppermost parts of the earth which receiveth it from their feet.

11 I have shewn above, that the difference between Grave and Acute Sounds consisteth in this, that by how much the shorter the time is, in which the reciprocations of the parts of a Body stricken are made, by so much the more Acute will be the Sound. Now by how much a Body of the same bigness, is either more heavy, or less stretched, by so much the longer will the reciprocations last; and therefore heavier, and less stretched Bodies (if they be like in all other respects) will yeild a Graver Sound then such as be lighter and more stretched.

As for the Conccent of Sounds, it is to be considered, that the reciprocation or Vibration of the Aire (by which Sound is made) after it hath reached the Drumme of the eare, imprinteth a like Vibration upon the air that is enclosed within it; by which means the sides of the Drumme within, are stricken alternately. Now the Conccent of two Sounds consists in this, that the Tympanum receive its stroke from both the Sounding Bodies in equal, & equally frequent spaces of time; So that when two strings make their Vibrations in the same times, the Conccent they produce, is the most exquisite of all other. For the sides of the Tympanum, (that is to say, of the Organ of Hearing) will be stricken by both those Vibrations together at once, on one side or other. For example, if the two equal strings A B and C D be stricken together, and the latitudes of their Vibrations E F and G H be also equal, and the points E, G, F & H be in the concave superficies of the Tympanum, so that it receive strokes from both the strings together in E and G, and again together in F and H, the Sound which is made by the Vibrations of each string, will be so like, that it may be taken for the same Sound, and is called Unison; which is the greatest Concord. Again, the string A B retaining still its former Vibration E F, let the string C D be stretched, till its Vibration have double the swiftness it had before, and let E F be divided equally in I. In what time therefore the string C D makes one part of its Vibration from G to H, in the same time the string A B will make

one part of its Vibration from E to I; and in what time the string C D hath made the other part of its Vibration back from

H to G, in the same time another part of the Vibration of the string A B will be made from I to F. But the points F and G are both in the sides of the Organ, and therefore they will strike the Organ both together, not at every stroke, but at every other storke. And this is the neerest Concord to Unison, and makes that Sound which is called an Eighth. Again, the Vibration of the string A B remayning still the same it was, let C D be stretched till its Vibration be swifter then that of the string A B, in the proportion of 3 to , and let E F be divided into three equal parts in K and L. In what time therefore the string C D makes one third part of its Vibration, which third part is from G to H, the string A B will make one third part of its Vibration, that is to say, two thirds of E F, namely, E L. And in what time the string C D makes another third part of its Vibration, namely H G, the string A B will make another third part of its Vibration, namely, from L to F, and back again from F to L. Lastly, whilst the string C D makes the last third part of its Vibration, that is, from G to H, the string A B will make the last third part of its Vibration from L to E. But the points E and H are both in the sides of the Organ. Wherefore at every third time the Organ will be stricken by the Vibration of both the strings together, and make that Concord which is called a Fifth.

12 For the finding out of the cause of Smels, I shall make use of the evidence of these following Phaenomena. First, that Smelling is hindred by Cold, and helped by Heat. Secondly, that when the Wind bloweth from the Object, the Smel is the stronger; and contrarily when it bloweth from the Sentient towards the Object, the weaker; both which Phaenomena are by experience manifestly found to be true in Doggs which follow the track of Beasts by the Sent. Thirdly, that such Bodies as are less pervious to the fluid Medium, yeild less Smell then such as are more pervious; as may be seen in

Stones and Metals, which compared with Plants and Living Creatures, and their Parts, Fruits and Excretions, have very little or no Smell at all. Fourthly, that such Bodies as are of their own nature Odorous, become yet more Odorous when they are bruised. Fifthly, that when the breath is stopped (at least in Men) nothing can be Smelt. Sixthly, that the sense of Smelling is also taken away by the stopping of the Nostrils, though the mouth be left open.

13 By the fourth and fifth Phaenomenon it is manifest, that the first and immediate Organ of Smelling is the innermost cuticle of the Nostrils, and that part of it which is below the passage common to the Nostrils and the Palate. For when we draw breath by the Nostrils, we draw it into the Lungs. That breath therefore which conveighs Smels, is in the way which passeth to the Lungs, that is to say, in that part of the Nostrils which is below the passage through which the breath goeth. For nothing is Smelt, neither beyond the passage of the breath within, nor at all without the Nostrils.

And seeing that from different Smels there must necessarily proceed some mutation in the Organ, and all mutation is motion; it is therefore also necessary that in Smelling, the parts of the Organ, that is to say, of that internal cuticle, and the nerves that are inserted into it, must be diversly moved by different Smels. And seeing also that it hath been demonstrated, that nothing can be moved but by a Body that is already moved and contiguous; and that there is no other Body contiguous to the internal membrane of the nostrils, but breath, that is to say, attracted aire, and such little solid invisible Bodies (if there be any such) as are intermingled with the aire; it follows necessarily, that the cause of Smelling is either the motion of that pure aire or aethereal Substance, or the motion of those small Bodies. But this motion is an effect proceeding from the Object of Smell, and therefore either the whole Object it self, or its several parts must necessarily be moved. Now we know, that Odorous Bodies make Odour though their

whole bulk be not moved. Wherefore the cause of Odour is the motion of the invisible parts of the Odorous Body. And these invisible parts do either go out of the Object, or else retaining their former situation with the rest of the parts, are moved together with them, that is to say, they have simple and invisible motion. They that say there goes something out of the Odorous Body, call it an Effluvium; which Effluvium is either of the aethereal substance, or of the small Bodies, that are intermingled with it. But that all variety of Odours should proceed from the Effluvia of those small Bodies that are intermingled with the aethereal substance, is altogether incredible, for these considerations; First, that certain Unguents, though very little in quantity, do nevertheless send forth very strong Odours, not onely to a great distance of place, but also to a great continuance of time, and are to be Smelt in every point both of that place and time; so that the parts issued out are sufficient to fill ten thousand times more space, then the whole Odorous Body is able to fill; which is impossible. Secondly, that whether that issuing out be with straight or with crooked motion, if the same quantity should flow from any other Odorous Body with the same motion, it would follow, that all Odorous Bodies would yeild the same Smell. Thirdly, that seeing those Effluvia have great Velocity of motion (as is manifest from this, that noysome Odours proceeding from caverns are presently Smelt at a great distance) it would follow, that by reason there is nothing to hinder the passage of those Effluvia to the Organ, such motion alone were sufficient to cause Smelling. Which is not so; for we cannot Smell at all unless we draw in our breath through our Nostrils. Smelling therefore is not caused by the Effluvium of Atomes; nor, for the same reason is it caused by the Effluvium of aethereal substance; for so also we should Smell without the drawing in of our breath. Besides the aethereal substance being the same in all Odorous Bodies, they would always affect

the Organ in the same manner, and consequently the Odours of all things would be like.

It remains therefore, that the cause of Smelling must consist in the Simple motion of the parts of Odorous Bodies, without any efflux or diminution of their whole substance. And by this motion, there is propagated to the Organ by the intermediate aire, the like motion, but not strong enough to excite Sense of it self without the attraction of aire by respiration. And this is a possible cause of Smelling.

14 The cause why Smelling is hindred by Cold, and helped by Heat, may be this, that Heat (as hath been shewn in the 21 Chapter) generateth Simple motion; and therefore also wheresoever it is already, there it will encrease it; and the cause of Smelling being encreased the Smell it self will also be encreased. As for the cause why the Wind blowing from the Object makes the Smell the stronger, it is all one with that for which the attraction of aire in respiration doth the same. For he that draws in the aire next to him, draws with it by succession that aire in which is the Object. Now this motion of the aire is Wind, and when another Wind bloweth from the Object, will be encreased by it.

15 That Bodies which contain the least quantity of air, as Stones and Metals, yeild less Smell then Plants and Living Creatures, the cause may be, that the motion which causeth Smelling, is a motion of the fluid parts onely; which parts, if they have any motion from the hard parts in which they are contained, they communicate the same to the open aire, by which it is propagated to the Organ. Where therefore there are no fluid parts, as in Metals; or where the fluid parts receive no motion from the hard parts, as in Stones, which are made hard by accretion, there can be no Smell. And therefore also the Water, whose parts have little or no motion, yeildeth no Smell. But if the same Water, by Seeds, and the heat of the Sunne, be together with particles of Earth raised into a Plant, and be afterwards

pressed out again, it will be Odorous, as Wine from the Vine. And as Water passing through plants is by the motion of the parts of those plants made an Odorous liquour; so also of aire passing through the same plants whilst they are growing, are made Odorous aires. And thus also it is with the Juices and Spirits which are bred in Living Creatures.

16 That Odorous Bodies may be made more Odorous by Contrition, proceeds from this, that being broken into many parts which are all Odorous, the aire which by respiration is drawn from the Object towards the Organ, doth in its passage touch upon all those parts, and receives their motion. Now the aire toucheth the superficies onely; and a Body having less superficies whilst it is whole, then all its parts together have after it is reduced to powder, it follows that the same Odorous Body yeildeth less Smell whilst it is whole, then it will do after it is broken into smaller parts. And thus much of Smels.

17 The Tast follows; whose generation hath this difference from that of the Sight, Hearing and Smelling, that by these we have Sense of remote Objects; whereas we Tast nothing but what is contiguous, and doth immediately touch either the Tongue or Palate, or both. From whence it is evident, that the cuticles of the Tongue and Palate, and the Nerves inserted into them are the first Organ of Tast; and (because from the concussion of the parts of these, there followeth necessarily a concussion of the Pia Mater) that the action communicated to these, is propagated to the Brain, and from thence to the farthest Organ, namely, the Heart; in whose reaction consisteth the nature of Sense.

Now that Savours (as well as Odours) doe not onely move the Brain, but the Stomack also, as is manifest by the loathings that are caused by them both, they that consider the Organ of both these Senses will not wonder at all; seeing the Tongue, the Palate & the Nostrils have one and the same continued cuticle, derived from the Dura Mater.

And that Effluviiums have nothing to doe in the Sense of Tasting, is manifest from this, that there is no Tast where the Organ and the Object are not contiguous.

By what variety of motions the different kinds of Tasts (which are innumerable) may be distinguished, I know not. I might (with others) derive them from the divers figures of those Atomes, of which whatsoever may be Tasted consisteth; or from the diverse motions which I might (by way of Supposition) attribute to those Atomes; conjecturing (not without some likelihood of truth) that such things as tast Sweet, have their particles moved with slow circular motion, and their figures Spherical, which makes them smooth and pleasing to the Organ; that Bitter things have circular motion, but vehement, and their figures full of Angles, by which they trouble the Organ; and that Sowre things have straight and reciprocal motion, and their figures long and small, so that they cut and wound the Organ. And in like manner I might assigne for the causes of other Tasts such several motions and figures of Atomes as might in probability seem to be the true causes. But this would be to revolt from Philosophy to Divination.

18 By the Touch, we feel what Bodies are Cold or Hot, though they be distant from us. Others, as Hard, Soft, Rough and Smooth, we cannot feel, unless they be contiguous. The Organ of Touch, is every one of those membranes, which being continued from the Pia Mater, are so diffused throughout the whole Body, as that no part of it can be pressed, but the Pia Mater is pressed together with it. Whatsoever therefore presseth it, is felt as Hard or Soft, that is to say, as more or less Hard. And as for the Sense of Rough, it is nothing else but innumerable perceptions of Hard and Hard succeeding one another by short intervals both of time and place. For we take notice of Rough and Smooth, as also of Magnitude and Figure, not onely by the Touch, but also by Memory. For though some things are

touched in one Point; yet Rough and Smooth, like Quantity and Figure, are not perceived but by the Flux of a Point, that is to say, we have no Sense of them without Time; and we can have no Sense of Time, without Memory.

CHAP. XXX. OF GRAVITY.

- 1 A THICK Body doth not contain more Matter (unless also more Place) then a Thinne.
- 2 That the Descent of Heavy Bodies proceeds not from their own Appetite; but from some Power of the Earth.
- 3 The difference of Gravities proceedeth from the difference of the Impetus with which the Elements whereof Heavy Bodies are made do fall vpon the Earth.
- 4 The cause of the Descent of Heavy Bodies.
- 5 In what proportion the Descent of Heavy Bodies is accelerated.
- 6 Why those that Dive do not when they are under Water, feel the waight of the Water above them.
- 7 The Waight of a Body that floateth, is equal to the Waight of so much Water as would fill the space which the immersed part of the Body takes up within the Water.
- 8 If a Body be Lighter then Water, then how big soever that Body be, it will float upon any quantity of Water, how little soever.
- 9 How Water may be lifted up and forced out of a Vessel by Air.
- 10 Why a Bladder is Heavier when blown full of aire, then when it is empty.
- 11 The cause of the ejection upwards of Heavy Bodies from a Wind-Gun.
- 12 The cause of the ascent of Water in a Weather-glass.

13 The cause of motion upwards in Living Creatures.

14 That there is in Nature a kind of Body Heavier then Aire, which nevertheless is not by Sense distinguishable from it.

15 Of the cause of Magnetical vertue.

1 IN the 21 Chapter I have defined Thick and Thinne (as that place required) so, as that by Thick was signified a more Resisting Body, and by Thinne a Body less Resisting; following the custome of those that have before me discoursed of Refraction. Now if we consider the true and vulgar signification of those words, we shall find them to be Names Collective, that is to say, Names of Multitude; as Thick to be that which takes up more parts of a space given, & Thinne that which contains fewer parts of the same magnitude, in the same space, or in a space equal to it. Thick therefore is the same with Frequent, as a Thick Troop; And Thinne the same with Unfrequent, as a Thinne Rank, Thinne of Houses; not that there is more matter in one place then in another equal place, but a greater quantity of some named Body. For there is not less matter or Body indefinitely taken, in a Desert, then there is in a City; but fewer Houses, or fewer Men. Nor is there in a Thick Rank a greater quantity of Body, but a greater number of Souldiers, then in a Thinne. Wherefore the multitude & paucity of the parts contained within the same space, do constitute Density and Rarity, whether those parts be separated by Vacuum, or by Aire. But the consideration of this is not of any great moment in Philosophy; and therefore I let it alone, and pass on to the search of the causes of Gravity.

2 Now we call those Bodies Heavy, which (unless they be hindred by some force) are carried towards the center of the Earth, and that by their own accord, for ought we can by Sense perceive to the contrary. Some Philosophers therefore have been of opinion, that the Descent of Heavy

Bodies proceeded from some internal Appetite, by which when they were cast upwards, they descended again, as moved by themselves, to such place as was agreeable to their nature. Others thought they were attracted by the Earth. To the former I cannot assent, because I think I have already clearly enough demonstrated, that there can be no beginning of motion, but from an external & moved Body; and consequently, that whatsoever hath motion or endeavour towards any place, will alwayes move or endeavour towards that same place, unless it be hindered by the reaction of some external Body. Heavy Bodies therefore being once cast upwards, cannot be cast down again but by external motion. Besides, seeing inanimate Bodies have no Appetite at all, it is ridiculous to think that by their own innate Appetite they should to preserve themselves (not understanding what preserves them) forsake the place they are in, and transferre themselves to another place; whereas Man (who hath both Appetite and understanding) cannot for the preservation of his own life, raise himselfe by leaping above three or four feet from the ground. Lastly, to attribute to created Bodies the power to move themselves, what is it else then to say that there be creatures which have no dependance upon the Creator? To the later, who attribute the Descent of Heavy Bodies to the attraction of the Earth, I assent. But by what motion this is done, hath not as yet been explained by any man. I shall therefore in this place say somewhat of the manner, and of the way by which the Earth by its action attracteth Heavy Bodies.

3 That by the supposition of simple motion in the Sunne, homogeneous Bodies are congregated, and heterogeneous dissipated, has already been demonstrated in the 5th Article of the 21 Chapter. I have also supposed, that there are intermingled with the pure Air, certain little Bodies, or (as others call them) Atomes, which by reason of their extreme smalness are invisible, and differing from one another in Consistence, Figure, Motion & Magnitude; from whence it comes to pass, that some of them are

congregated to the Earth, others to other Planets, and others are carried up and down in the spaces between. And seeing those which are carried to the Earth, differ from one another in Figure, Motion and Magnitude, they will fall upon the Earth, some with greater, others with less Impetus. And seeing also that we compute the several degrees of Gravity no otherwise then by this their falling upon the Earth with greater or less Impetus; it follows, that we conclude those to be the more Heavy that have the greater Impetus, and those to be less Heavy that have the less Impetus. Our enquiry therefore must be, by what means it may come to pass, that of Bodies which descend from above to the Earth, some are carried with greater, others with less Impetus; that is to say, some are more Heavy then others. We must also enquire, by what means such Bodies as settle upon the Earth, may by the Earth it self be forced to ascend.

4 Let the Circle made upon the center C (in the 2d figure) be a great Circle in the Superficies of the Earth, passing through the points A and B. Also let any Heavy Body, as the stone A D be placed any where in the plain of the Aequator; and let it be conceived to be cast up from A D perpendicularly, or to be carried in any other line to E, and supposed to rest there. Therefore how much space soever the stone took up in A D, so much space it takes up now in E. And because all place is supposed to be full, the space A D will be filled by the aire which flows into it first from the nearest places of the Earth, and afterwards successively from more remote places. Upon the center C let a Circle be understood to be drawn through E; and let the plain space which is between the Superficies of the Earth and that Circle, be divided into plain Orbs equal and concentrique; of which, let that be the first which is contained by the two perimeters that pass through A & D. Whilst therefore the aire which is in the first Orbe, filleth the place A D, the Orbe it self is made so much less, and consequently its latitude is less then the straight line A D. Wherefore there will necessarily descend so

much aire from the Orbe next abvoe. In like manner, for the same cause, there will also be a descent of aire from the Orbe next above that; and so by Succession from the Orbe in which the Stone is at rest in E. Either therefore the Stone it self, or so much aire will descend. And seeing aire is by the diurnal revolution of the Earth more easily thrust away, then the Stone, the aire which is in the Orbe that contains the Stone will be forced further upwards then the Stone. But this, without the admission of Vacuum, cannot be, unless so much aire descend to E from the place next above; which being done, the Stone will be thrust downwards. By this means therefore the Stone now receives the beginning of its Descent, that is to say, of its Gravity. Furthermore, whatsoever is once moved, will be moved continually (as hath been shewn in the 19th Article of the 8th Chapter) in the same way, and with the same celerity, except it be retarded or accelerated by some external Movent. Now the aire (which is the onely Body that is interposed between the Earth A and the stone above it E) will have the same action in every point of the straight line E A, which it hath in E. But it depressed the stone in E; and therefore also it will depress it equally in every point of the straight line E A. Wherefore the stone will descend from E to A with accelerated motion. The possible cause therefore of the Descent of Heavy Bodies under the Aequator, is the Diurnal motion of the Earth. And the same demonstration will serve, if the stone be placed in the plain of any other Circle parallel to the Aequator. But because this motion hath by reason of its greater slowness, less force to thrust off the aire in the parallel Circles then in the Aequator, and no force at all at the Poles, it may well be thought (for it is a certain consequent) that Heavy Bodies descend with less and less velocity, as they are more & more remote from the Aequator; & that at the Poles themselves they wil either not descend at all, or not descend by the Axis; which whether it be true or false, Experience must determine. But it is hard to make the experiment, both because the times of

their descents cannot be easily measured with sufficient exactness, and also because the places neer the Poles are inaccessible. Nevertheless, this we know, that by how much the neerer we come to the Poles, by so much the greater are the Flakes of the Snow that falls; and by how much the more swiftly such Bodies descend as are fluid and dissipable, by so much the smaller are the particles into which they are dissipated.

5 Supposing therefore this to be the cause of the Descent of Heavy Bodies; it will follow, that their motion will be accelerated in such manner, as that the spaces which are transmitted by them in the several times, will have to one another the same proportion which the odd numbers have in succession from Unity. For if the straight line EA be divided into any number of equal parts, the Heavy Body descending, will (by reason of the perpetual action of the Diurnal motion) receive from the aire in every one of those times, in every several point of the streight line EA, a several new and equal impulsion; and therefore also in every one of those times it will acquire a several and equal degree of celerity. And from hence it follows, by that which Galilaeus hath in his Dialogues of Motion demonstrated, that Heavy Bodies descend in the several times with such differences of transmitted spaces as are equal to the differences of the square numbers that succeed one another from Unity; which square numbers being 1, 4, 9, 16, &c. their differences are 3, 5, 7, &c; that is to say, the odd numbers which succeed another from Unity. Against this cause of Gravity which I have given, it will perhaps be objected, that if a Heavy Body be placed in the bottom of some hollow Cylinder of Iron or Adamant, and the bottom be turned upwards, the Body will descend, though the aire above cannot depress it, much less accelerate its motion. But it is to be considered, that there can be no Cylinder or Cavern, but such as is supported by the Earth, and being so supported, is together with the Earth carried about by its diurnal Motion. For by this means the bottom of the Cylinder will be as the

Superficies of the Earth; and by thrusting off the next and lowest aire, will make the uppermost aire depress the Heavy Body which is at the top of the Cylinder, in such manner as is above explicated.

6 The Gravity of Water being so great as by experience wee find it is, the reason is demanded by many, why those that Dive, how deep soever they go under water, do not at all feel the weight of the water which lyes upon them. And the cause seems to be this, that all Bodies by how much the Heavier they are, by so much the greater is the endeavour by which they tend downwards. But the Body of a Man is Heavier then so much water as is equal to it in magnitude, and therefore the endeavour downwards of a Mans Body is greater then that of water. And seeing all endeavour is motion, the Body also of a Man will be carried towards the bottom with greater Velocity then so much water. Wherefore there is greater Reaction from the bottom; and the Endeavour upwards is equal to the endeavour downwards, whether the water be pressed by water, or by another Body which is Heavier then water. And therefore by these two opposite equal endeavours, the endeavour both ways in the water is taken away; and consequently, those that Dive are not at all pressed by it.

Coroll. From hence also it is manifest, that water in water hath no Waight at all, because all the parts of water (both the parts above, and the parts that are directly under) tend towards the bottom with equal endeavour and in the same straight lines.

7 If a Body float upon the water, the waight of that Body is equal to the waight of so much water as would fill the place which the immersed part of the Body takes up within the water.

Let EF (in the 3d figure) be a Body floating in the water ABCD; and let the part E be above, and the other part F under the water. I say the waight of the whole Body EF is equal to the waight of so much water as the Space F will receive. For seeing the waight of the Body EF forceth the water out of

the space F, and placeth it upon the Superficies AB, where it presseth downwards; it follows, that from the resistance of the bottom there will also be an endeavour upwards. And seeing again that by this endeavour of the water upwards, the Body EF is lifted up; it follows, that if the endeavour of the Body downwards be not equal to the endeavour of the water upwards, either the whole Body EF will (by reason of that inequality of their endeavours or moments) be raised out of the water, or else it will descend to the bottom. But it is supposed to stand so, as neither to ascend nor descend. Wherefore there is an Aequilibrium between the two endeavours; that is to say, the waight of the Body EF is equal to the waight of so much water as the Space F will receive; Which was to be proved.

8 From hence it follows, that any Body of how great magnitude soever, provided it consist of matter less Heavy then water, may nevertheless float upon any quantity of water how little soever.

Let ABCD (in the 4th figure) be a vessel; and in it let EFGH be a Body consisting of matter which is less Heavy then water; and let the space AGCF be filled with water. I say the Body EFGH will not sink to the bottom DC. For seeing the matter of the Body EFGH is less Heavy then Water, if the whole space without ABCD were full of Water, yet some part of the Body EFGH, as EFIK would be above the Water; and the waight of so much water as would fill the space IGHK would be equal to the waight of the whole Body EFGH; and consequently GH would not touch the bottom DC. As for the sides of the vessel, it is no matter whether they be hard, or fluid; for they serve onely to terminate the Water; which may be done as well by water as by any other matter how hard soever; and the water without the Vessel is terminated somewhere, so as that it can spread no further. The part therefore EFIG will be extant above the water AGCF which is contained in the vessel. Wherefore the Body EFGH will also float

upon the water AGCF, how little soever that water be; which was to be demonstrated.

9 In the 4th Article of the 26th Chapter, there is brought for the proving of Vacuum, the experiment of water enclosed in a vessel; which water, the Orifice above being opened, is ejected upwards by the impulsion of the aire. It is therefore demanded (seeing water is Heavier then aire) how that can be done. Let the 2d. figure of the same 26th Chap. be considered, where the water is with great force injected by a Syringe into the space FGB. In that injection, the aire (but pure aire) goeth with the same force out of the vessel through the injected water. But as for those small Bodies which formerly I supposed to be intermingled with aire, & to be moved with simple motion, they can not together with the oure air penetrate the water; but remayning behind are necessarily thrust together into a narrower place, namely into the space which is above the water FG. The motions therefore of those small Bodies will be less and less free, by how much the quantity of the injected water is greater and greater; so that by their motions falling upon one another the same small Bodies will mutually compress each other, and have a perpetual endeavour of regayning their liberty, and of depressing the water that hinders them. Wherefore, as soone as the orifice above is opened, the water which is next it will have an endeavour to ascend; and will therefore necessarily go out. But it cannot go out, unless at the same time there enter in as much aire; and therefore both the water will go out, and the aire enter in, till those small Bodies which were left within the vessel have recovered their former liberty of motion; that is to say, till the vessel be again filled with aire, and no water be left of sufficient height to stop the passage at B. Wherefore I have shewn a possible cause of this Phaenomenon; namely, the same with that of Thunder. For as in the generation of Thunder, the small Bodies enclosed within the Clouds by being too closely pent together, do by their motion break the Clouds, and restore themselves to their natural

liberty; so here also the small Bodies enclosed within the space which is above the straight line FG, do by their own motion expel the water as soon as the passage is opened above. And if the passage be kept stopped, and these small Bodies be more vehemently compressed by the perpetual forcing in of more water, they will at last break the vessel it self with great noise.

10 If Aire be blown into a hollow Cylinder, or into a Bladder, it will encrease the waight of either of them a little, as many have found by experience, who with great accurateness have tried the same. And it is no wonder, seeing (as I have supposed) there are intermingled with the common aire a great number of small hard Bodies which are Heavier then the pure aire. For the aethereal substance, being on all sides equally agitated by the motion of the Sunne, hath an equal endeavour towards all the parts of the Universe; and therefore it hath no Gravity at all.

11 We find also by experience, that by the force of air enclosed in a hollow Canon, a bullet of lead may with considerable violence be shot out of a Gunne of late invention, called the Wind-Gun. In the end of this Canon there are two holes with their Valves on the inside, to shut them close; one of them serving for the admission of aire, and the other for the letting of it out. Also to that end which serves for the receiving in of aire, there is joyned another Canon of the same metal and bigness, in which there is fitted a Rammer, which is perforated, and hath also a Valve opening towards the former Canon. By the help of this Valve the Rammer is easily drawn back, and letteth in aire from without; and being often drawn back and returned again with violent strokes, it forceth some part of that aire into the former Canon, so long, till at last the resistance of the enclosed aire is greater then the force of the stroke. And by this means men think there is now a greater quantity of aire in the Canon then there was formerly, though it were full before. Also the aire thus forced in, how much soever it be, is

hindered from getting out again by the foresaid Valves, which the very endeavour of the aire to get out doth necessarily shut. Lastly, that Valve being opened which was made for the letting out of the aire, it presently breaketh out with violence, & driveth the bullet before it with great force and velocity.

As for the cause of this, I could easily attribute it (as most men do) to Condensation, and think that the aire, which had at the first but its ordinary degree of Rarity, was afterwards by the forcing in of more aire condensed, and last of all rarified again by being let out and restored to its natural liberty. But I cannot imagine how the same place can be alwayes full, and nevertheless contain sometimes a greater, sometimes a less quantity of matter; that is to say, that it can be fuller then full. Nor can I conceive, how Fulness can of it self be an efficient cause of motion. For both hese are impossible. Wherefore we must seek out some other possible cause of this Phaenomenon. Whilst therefore the Valve w^{ch} serves for the letting in of aire is opened by the first stroke of the Rammer, the aire within doth with equal force resist the entering of the aire from without; so that the endeavours between the internal and external aire are opposite, that is, there are two opposite motions, whilst the one goeth in and the other cometh out; but no augmentation at all of aire within the Canon. For there is driven out by the stroke as much pure aire which passeth between the Rammer and the sides of the Canon, as there is forced in of aire impure by the same stroke. And thus by many forcible strokes the quantity of small hard Bodies will be encreased within the Canon, and their motions also will grow stronger and stronger as long as the matter of the Canon is able to endure their force; by which if it be not broken, it will at least be urged every way by their endeavour to free themselves; and as soon as the Valve which serves to let them out is opened, they will fly out with violent motion, and carry with

them the bullet which is in their way. Wherefore I have given a possible cause of this Phaenomenon.

12 Water, contrary to the custome of Heavy Bodies, ascendeth in the Weather-glasse; but it doth it when the aire is cold; for when it is warme it descendeth againe. And this Organ is called a Thermometer, or Thermoscope, because the degrees of Heat and Cold are measured and marked by it. It is made in this manner. Let A B C D (in the 5th figure) be a vessel full of water, and E F G a hollow Cylinder of glasse, closed at E, and open at G. Let it be heated, and set upright within the water to F; and let the open end reach to G. This being done as the aire by little and little grows colder, the water will ascend slowly within the Cylinder from F towards E; till at last the externall and internall aire coming to be both of the same temper, it will neither ascend higher, nor descend lower, till the temper of the aire be changed. Suppose it therefore to be setled any where, as at H. If now the heat of the aire be augmented, the water will descend below H; and if the heat be diminished, it will ascend above it. Which though it be certainly known to be true by experience, the cause neverthesse hath not as yet been discovered.

In the 6 and 7 articles of the 27th chapter (where I consider the cause of Cold) I have shewne, that fluid Bodies are made colder by the pressure of the aire, that is to say, by a constant Wind that presseth them. For the same cause it is, that the Superficies of the water is pressed at F; and having no place to which it may retire from this pressure besides the cavity of the Cylinder between H and E, it is therefore necessarily forced thither by the Cold, and consequently it ascendeth more or lesse, according as the Cold is more or lesse encreased. And againe, as the Heat is more intense, or the Cold more remisse, the same water will be depressed more or lesse by its own Gravity, that is to say, by the cause of Gravity above explicated.

13 Also Living creatures, though they be Heavy, can by Leaping, Swimming & Flying raise themselves to a certain degree of height. But they cannot do this except they be supported by some resisting Body, as the Earth, the Water and the Aire. For these motions have their beginning from the contraction (by the helpe of the Muscles) of the Body animate. For to this contraction there succeedeth a distension of their whole Bodies; by which distension, the Earth, the Water or the Aire which supporteth them, is pressed; and from hence, by the reaction of those pressed Bodies, Living Creatures acquire an endeavour upwards, but such, as by reason of the Gravity of their Bodies is presently lost againe. By this endeavour therefore it is, that Living creatures raise themselves up a little way by Leaping, but to no great purpose; but by Swimming & Flying they raise themselves to a greater height; because before the effect of their endeavour is quite extinguished by the Gravity of their bodies, they can renew the same endeavour againe.

That by the power of the Soule, without any antecedent contraction of the Muscles, or the helpe of something to support him, any man can be able to raise his Body upwards, is a childish conceipt. For if it were true, a man might raise himselfe to what height he pleased.

14 The diaphanous Medium which surrounds the Eie on all sides, is invisible; Nor is Aire to be seen in Aire, nor Water in Water, nor any thing but that which is more opacous. But in the confines of two diaphanous Bodies, one of them may be distinguished from the other. It is not therefore a thing so very ridiculous for ordinary people to think all that Space empty, in which we say is Aire; it being the worke of Reason to make us conceive that the Aire is any thing. For by which of our Senses is it, that we take notice of the Aire, seeing we neither See, nor Hear, nor Taste, nor Smell, nor Feel it to be any thing? When we feel Heat, we do not impute it to the Air, but to the Fire; nor do we say the aire is Cold, but we our selves are Cold;

and when we feel the Wind, we rather think something is coming, then that any thing is already come. Also we do not at all feel the weight of water in water, much less of air in air. That we come to know that to be a Body which we call Air, it is by Reasoning; but it is from one Reason only, namely, because it is impossible for remote Bodies to work upon our Organs of Sense but by the help of Bodies intermediate, without which we could have no sense of them, till they came to be contiguous. Wherefore, from the Senses alone, without reasoning from effects, we cannot have sufficient evidence of the nature of Bodies.

For there is under-ground in some Mines of Coals, a certain matter of a middle nature between Water and Air, which nevertheless cannot by Sense be distinguished from air; for it is as Diaphanous as the purest air; and as far as Sense can judge, equally penetrable. But if we look upon the effect, it is like that of water. For when that matter breaks out of the Earth into one of those Pits, it fills the same either totally, or to some degree; and if a Man, or Fire be then let down into it, it extinguishes them in almost as little time as water would do. But for the better understanding of this Phaenomenon, I shall describe the 6th figure. In which, let A B represent the pit of the Mine; and let part thereof, namely, C B be supposed to be filled with that matter. If now a lighted Candle be let down into it below C, it will as suddenly be extinguished, as if it were thrust into water. Also if a grate filled with coals thoroughly kindled and burning never so brightly, be let down; as soon as ever it is below C, the fire will begin to grow pale, and shortly after (losing its light) be extinguished, no otherwise then if it were quenched in water. But if the grate be drawn up again presently, whilst the coals are still very hot, the fire will by little and little be kindled again, and shine as before. There is indeed between this matter & water this considerable difference, that it neither wetteth, nor sticketh to such things as are put down into it, as water doth; which by the moisture it leaveth, hindereth the kindling again of

the matter once extinguished. In like manner, if a Man be let down below C, he will presently fall into a great difficulty of breathing, and immediately after into a swoun, and die, unless he be suddenly drawn up again. They therefore that go down into these pits, have this custome, that as soon as ever they feel themselves sick, they shake the rope by which they were let down, to signifie they are not well, and to the end that they may speedily be pulled up again. For if a man be drawn out too late, void of sense and motion, they digg up a Turff, and put his face and mouth into the fresh earth; by which means (unless he be quite dead) he comes to himself again by little and little, and recovers life by the breathing out (as it were) of that suffocating matter which he had sucked in whilst he was in the pit; almost in the same manner as they that are drowned come to themselves again by vomiting up the water. But this doth not happen in all Mines, but in some onely; and in those not alwayes, but often. In such Pits as are subject to it, they use this remedy. They dig another pit, as DE, close by it, of equal depth; and joyning them both together with one common channel EF, they make a Fire in the bottom E, which carries out at D the aire contained in the pit DE; and this draws with it the aire contained in the channel EF; which in like manner is followed by the noxious matter contained in CB; & by this means the pit is for that time made healthful. Out of this History (which I write onely to such as have had experience of the truth of it, without any designe to support my Philosophy with Stories of doubtful credit) may be collected the following possible cause of this Phaenomenon; namely, that there is a certain matter, fluid, & most transparent, and not much lighter then water; which breaking out of the Earth fills the Pit to C; and that in this matter, as in water, both Fire and Living creatures are extinguished.

15 About the nature of Heavy Bodies, the greatest difficulty ariseth from the contemplation of those things which make other Heavy Bodies ascend to them; such are Jet, Amber, and the Loadstone. But that which troubles

men most is the Loadstone, which is also called Lapis Herculeus; a stone, though otherwise despicable, yet of so great power, that it taketh up Iron from the Earth, and holds it suspended in the aire, as Hercules did Antaeus. Nevertheless, we wonder at it somewhat the less, because we see Jet draw up Straws, which are Heavy Bodies, though not so Heavy as Iron. But as for Jet, it must first be excited by rubbing, that is to say, by motion to and fro; whereas the Loadstone hath sufficient excitation from its own nature, that is to say, from some internal principle of motion peculiar to it self. Now whatsoever is moved, is moved by some contiguous and moved Body, as hath been formerly demonstrated. And from hence it follows evidently, that the first endeavour which Iron hath towards the Loadstone, is caused by the motion of that aire which is contiguous to the Iron. Also that this motion is generated by the motion of the next aire, and so on successively, till by this succession we find that the motion of all the intermediate air taketh its beginning from some motion which is in the Loadstone it self; which motion (because the Loadstone seems to be at rest) is invisible. It is therefore certain, that the attractive power of the Loadstone is nothing else but some motion of the smallest particles thereof. Supposing therefore that those small Bodies of which the Loadstone is (in the bowels of the Earth) composed, have by nature such motion or endeavour as was above attributed to Jet, namely a reciprocal motion in a line too short to be seen, both those stones wil have one & the same cause of attraction. Now in what manner, and in what order of working this cause produceth the effect of attraction, is the thing to be enquired. And first we know, that when the string of a Lute or Viol is stricken, the Vibration, that is, the reciprocal motion of that string in the same straight Line, causeth like Vibration in another string which has like tension. We know also, that the dregs or small sands which sink to the bottom of a Vessel, will be raised up from the bottom by any strong and reciprocal agitation of the water stirred with the

hand or with a staff. Why therefore should not reciprocal motion of the parts of the Loadstone contribute as much towards the moving of Iron? For if in the Loadstone there be supposed such reciprocal motion, or motion of the parts forwards and backwards, it will follow, that the like motion will be propagated by the aire to the Iron, and consequently that there will be in all the parts of the Iron the same reciprocations or motions forwards and backwards. And from hence also it will follow, that the intermediate aire between the Stone and the Iron will by little and little be thrust away; and the aire being thrust away, the Bodies of the Loadstone and the Iron will necessarily come together. The possible cause therefore why the Loadstone and Jet draw to them, the one Iron, the other Strawes, may be this, that those attracting Bodies have reciprocal motion either in a straight line, or in an Elliptical line, when there is nothing in the nature of the attracted Bodies which is repugnant to such a motion.

But why the Loadstone (if with the help of Cork it float at liberty upon the top of the water) should from any position whatsoever so place it self in the plain of the Meridian, as that the same points which at one time of its being at rest respect the Poles of the Earth, should at all other times respect the same Poles, the cause may be this, That the reciprocal motion which I supposed to be in the parts of the Stone, is made in a line parallel to the Axis of the Earth, and has been in those parts ever since the Stone was generated. Seeing therefore the Stone whilst it remains in the Mine, and is carried about together with the Earth by its diurnal motion, doth by length of time get a habit of being moved in a line which is perpendicular to the line of its reciprocal motion, it will afterwards, though its axis be removed from the parallel situation it had with the axis of the Earth, retain its endeavour of returning to that situation again; and all endeavour being the beginning of motion, and nothing intervening that may hinder the same, the Loadstone will therefore return to its former situation. For any piece of Iron

that has for a long time rested in the plain of the Meridian, whensoever it is forced from that situation, and afterwards left to its own liberty again, will of it self return to lie in the Meridian again; which return is caused by the endeavour it acquired from the diurnal motion of the Earth in the parallel circles which are perpendicular to the Meridians.

If Iron be rubbed by the Loadstone drawn from one Pole to the other, two things will happen; one, that the Iron will acquire the same direction with the Loadstone, that is to say, that it will lie in the Meridian, and have its Axis and Poles in the same position with those of the Stone; the other, that the like Poles of the Stone and of the Iron will avoid one another, and the unlike Poles approach one another. And the cause of the former may be this, that Iron being touched by motion which is not reciprocal, but drawn the same way from Pole to Pole, there will be imprinted in the Iron also an endeavour from the same Pole to the same Pole. For seeing the Loadstone differs from Iron no otherwise then as Ore from Metal, there will be no repugnance at all in the Iron to receive the same motion which is in the Stone. From whence it follows, that seeing they are both affected alike by the diurnal motion of the Earth, they will both equally return to their situation in the Meridian whensoever they are put fro[—] the same Also of the later this may be the cause, that as the Loadstone in touching the Iro[—] doth by its action imprint in the Iron an endeavour towards one of the Poles, suppose towards the North Pole; so reciprocally, the Iron by its action upon the Loadstone doth imprint in it an endeavour towards the other Pole, namely towards the South Pole. It happens therefore in these reciprocations or motions forwards and backwards of the particles of the Stone and of the Iron betwixt the North & the South, that whilst in one of them the motion is from North to South, and the return from South to North, in the other the motion will be from South to North, & the return fro[—] North to South; which motions being opposite to one another, and communicated to the Air, the

North Pole of the Iron (whilest the attraction is working) will be depressed towards the South Pole of the Loadstone; or contrarily the North Pole of the Loadstone will be depressed towards the South Pole of the Iron; and the Axes both of the Loadstone and of the Iron will be situate in the same straight line. The truth whereof is taught us by experience.

As for the propagation of this Magnetical vertue, not onely through the Aire, but through any other Bodies how hard so ever, it is not to be wondred at, seeing no motion can be so weak, but that it may be propagated infinitely through a space filled with Body of any hardness whatsoever. For in a full Medium, there can be no motion which doth not make the next part yeild, and that the next, and so successively without end; so that there is no effect whatsoever but to the production thereof something is necessarily contributed by the several motions of all the several things that are in the World.

And thus much concerning the nature of Body in general; with which I conclude this my first Section of the Elements of Philosophy. In the first, second and third Parts, where the Principles of Ratiocination consist in our own Understanding, that is to say, in the legitimate use of such Words as we our selves constitute, all the Theoremes (if I be not deceived) are rightly demonstrated. The fourth Part depends upon Hypotheses; which unless we know them to be true, it is impossible for us to demonstrate that those Causes which I have there explicated, are the true Causes of the things whose productions I have derived from them.

Nevertheless, seeing I have assumed no Hypothesis, which is not both possible and easie to be comprehended; and seeing also that I have reasoned aright from those Assumptions, I have withall sufficiently demonstrated that they may be the true Causes; w^{ch} is the end of Physical Contemplation. If any other man from other Hypotheses shall demonstrate the same, or greater things, there wil be greater praise and thanks due to him then I demand for

my self, provided his Hypotheses be such as are conceivable. For as for those that say any thing may be moved or produced by it Self, by Species, by its own Power, by Substantial Forms, by Incorporeal Substances, by Instinct, by Anteperistasis, by Antipathy, Sympathy, Occult Quality, and other empty words of Schoolmen, their saying so is to no purpose.

And now I proceed to the Phaenomena of Mans Body; Where I shall speak of the Opticks, and of the Dispositions, Affections, and Manners of Men (if it shall please God to give me life), and shew their Causes.

Six Lessons to the Professor of Mathematics

1656 EDITION

CONTENTS

To the Right Honourable, Henry Lord Pierrepont, Viscount Newarke, Earle of Kingstone, and Marquis of Dorchester.

TO THE EGREGIOUS PROFESSORS OF THE MATHEMATICKS, ONE OF GEOMETRY, THE OTHER OF ASTRONOMY, IN THE CHAIRS SET UP BY THE NOBLE AND LEARNED SIR HENRY SAVILE, IN THE UNIVERSITY OF OXFORD. LESSON I.

OF THE FAULTS THAT OCCURRE IN DEMONSTRATION. TO THE SAME EGREGIOUS PROFESSORS OF THE MATHEMATICKS IN THE UNIVERSITY OF OXFORD. LESSON II.

OF THE FAULTS THAT OCCURRE IN DEMONSTRATION. TO THE SAME EGREGIOUS PROFESSORS OF THE MATHEMATICKS IN THE UNIVERSITY OF OXFORD. LESSON III.

OF THE FAULTS THAT OCCURRE IN DEMONSTRATION. TO THE SAME EGREGIOUS PROFESSORS OF THE MATHEMATICKS IN THE UNIVERSITY OF OXFORD. LESSON V.

OF MANNERS. TO THE SAME EGREGIOUS PROFESSORS OF THE MATHEMATICKS IN THE UNIVERSITY OF OXFORD. LESSON VI.

SIX LESSONS TO THE PROFESSORS
OF THE MATHEMATIQUES, ONE OF GEOMETRY,
THE OTHER OF ASTRONOMY: IN THE CHAIRES SET UP BY THE
NOBLE AND LEARNED SIR HENRY SAVILE, IN THE UNIVERSITY
OF OXFORD.

LONDON. PRINTED BY J. M. FOR ANDREW CROOK,
AT THE GREEN-DRAGON,
IN PAULS CHURCH-YARD.

**To the Right Honourable, Henry Lord Pierrepont,
Viscount Newarke, Earle of Kingstone, and Marquis of
Dorchester.**

MY MOST NOBLE LORD,

NOT knowing on my own part any cause of the favour your Lordship has been pleased to express towards me, unless it be the Principles, Method, and Manners you have observed and approved in my Writings; and seeing these have all been very much reprehended by men to whom the name of Publique Professors hath procured reputation in the University of Oxford; I thought it would be a forfeiture of your Lordships good opinion, not to justifie my self in publique also against them. Which, whether I have sufficiently performed or not in the six following Lessons addressed to the same Professors, I humbly pray your Lordship to consider. The volume it self is too small to be offered to you as a Present; but to be brought before you as a Controversie it is perhaps the better for being short. Of Arts, some are demonstrable, others indemonstrable; and demonstrable are those the construction of the Subject whereof is in the power of the Artist himself; who in his demonstration does no more but deduce the Consequences of his own operation. The reason whereof is this, that the Science of every Subject is derived from a praecognition of the Causes, Generation, and Construction of the same; and consequently where the Causes are known, there is place for Demonstration; but not where the Causes are to seek for. Geometry therefore is demonstrable; for the Lines and Figures from which we reason are drawn and described by our selves; and Civill Philosophy is, we make the Commonwealth our selves. But because of Naturall Bodies we know not

the Construction, but seek it from the Effects, there lyes no demonstration of what the Causes be we seek for, but onely of what they may be.

And where there is place for Demonstration, if the first Principles, that is to say, the Definitions contain not the Generation of the Subject; there can be nothing demonstrated as it ought to be. And this in the three first Definitions of Euclide sufficiently appeareth. For seeing he maketh not, nor could make any use of them in his Demonstrations, they ought not to be numbered among the Principles of Geometry. And Sextus Empiricis maketh use of them (misunderstood, yet so understood as the said Professors understand them) to the overthrow of that so much renouned Evidence of Geometry. In that part therefore of my Book where I treat of Geometry, I thought it necessary in my Definitions to express those Motions by which Lines, Superficies, Solids and Figures were drawn and described; little expecting that any Professor of Geometry should finde fault therewith; but on the contrary supposing I might thereby not only avoid the Cavils of the Scepticks, but also demonstrate divers Propositions which on other Principles are indemonstrable. And truly, if you shall finde those my Principles of Motion made good, you shall find also that I have added something to that which was formerly extant in Geometry.

For first from the seventh Chapter of my Book de Corpore to the thirteenth, I have rectified and explained the Principles of the Science, id est, I have done that business for which Doctor Wallis receives the wages. In the seventh, I have exhibited and demonstrated the proportion of the Parabola and Parabolasters to the Parallelograms of the same height and base; which (though some of the propositions were extant without their demonstration) were never before demonstrated, nor are by any other then this method demonstrable.

In the eighteenth, (as it is now in English) I have demonstrated the (for any thing I yet perceive) Equation between the crooked line of a Parabola or

any Parabolaster and a straight line.

In the twenty-third, I have exhibited the Center of Gravity of any Sector of a Sphere.

Lastly, the twenty-fourth, (which is of the nature of Refractiand Reflexion) is almost all new.

But your Lordship will ask me what I have done in the twentieth, about the Quadrature of the Circle. Truly, my Lord, not much more then before. I have let stand there that which I did before condemn, not that I think it exact, but partly because the Division of Angles may be more exactly performed by it then by any organicall way whatsoever; and I have attempted the same by another Method, which seemeth to me very naturall, but of calculation difficult and slippery. I call them only Aggressions, retaining nevertheless the formall manner of Assertion used in Demonstration. For I dare not use such a doubtfull word as Videtur, because the Professors are presently ready to oppose me with a Videtur quod non. Nor am I willing to leave those Aggressions out, but rather to try if it may be made pass for lawfull (in spite of them that seek honour not from their own performances but from other mens failings) amongst many difficult undertakings carryed through at once) to leave one and the greatest for a time behind; and partly because the method is such as may hereafter give further light to the finding out of the exact truth.

But the Principles of the Professors that reprehend these of mine, are some of them so void of sense, that a man at the first hearing, whether Geometrician or not Geometrician must abhor them. As for example;

1. That two equall Proportions are not double to one of the same Proportions.
2. That a Proportion is double, triple, &c. of a Number, but not of a Proportion.

3. That the same Body, without adding to it, or taking from it, is sometimes Greater, and sometimes less.

4. That a Quantity may grow less and less Eternally, so as at last to be equall to another Quantity; or (which is all one) that there is a Last in Eternity.

5. That the nature of an Angle consisteth in that which lyes between the lines that comprehend the Angle in the very point of their concourse; that is to say, An Angle is the Superficies which lyes between the two Points which touch, or (as they understand a Point) the Superficies that lyes between the two Nothings which touch.

6. That the Quotient is the Proportion of the Division to the Dividend.

Upon these and some such other Principles is grounded all that Doctor Wallis has said not onely in his Elenchus of my Geometry, but also in his Treatises of the Angle of Contact, and in his Arithmetica Infinitorum; which two last I have Fere in two or three leaves wholly and cleerly confuted. And I verily believe that since the beginning of the world there has not been, nor ever shall be so much absurdity written in Geometry, as is to be found in those books of his; with which there is so much presumption joyned, that an of the like conjunction cannot be expected in less then a Platonick year. The cause whereof I imagine to be this, that he mistook the study of Symboles for the study of Geometry, and thought Symbolicall writing to be a new kinde of Method, and other mens Demonstrations set down in Symboles new Demonstrations. The way of Analysis by Squares, Cubes, &c. is very antient, and usefull for the finding out whatsoever is contained in the nature and generation of rectangled Plains (which also may be found without it) and was at the highest in Vieta; but I never saw any thing added thereby to the Science of Geometry, as being a way wherein men go round from the Equality of rectangled Plains to the Equality of Proportion, and

thence again to the Equality of rectangled Plains; wherein the Symboles serve only to make men go faster about, as greater Winde to a Winde-mill.

It is in Sciences as in Plants; Growth and Branching is but the Generation of the Root continued; nor is the Invention of Theoremes any thing else but the knowledge of the Construction of the Subject prosecuted. The unsoundness of the Branches are no prejudice to the Roots; nor the Faults of Theoremes to the Principles. And active Principles will correct false Theoremes if the Reasoning be good; but no Logique in the world is good enough to draw evidence out of false or unactive Principles. But I detain your Lordship too long. For all this will be much more manifest in the following Discourses: wherein I have not onely explained and rectified many of the most important Principles of Geometry: but also by the examples of those errors which have been committed by my Reprehenders, made manifest the evil Consequence of the Principles they now proceed on. So that it is not only my own Defence that I here bring before you, but also a positive doctrine concerning the true Grounds, or rather Atomes of Geometry: which I dare only say are very singular: but whether they be very good or not, I submit to your Lordships judgement. And seeing you have been pleased to bestow so much time (with great success) in the reading of what has been written by other men in all kindes of Learning. I humbly pray your Lordship to bestow also a little time upon the reading of these few and short Lessons; and if your Lordship finde them agreeable to your Reason and Judgement, let me (notwithstanding the clamour of my Adversaries) be continued in your good opinion, and still retain the honour of being

My most Noble Lord,

London, Iune 10. 1656.

Your Lordships most Humble and Obliged Servant,

THOMAS HOBBS.

**TO THE EGREGIOUS PROFESSORS OF THE
MATHEMATICKS, ONE OF GEOMETRY, THE OTHER OF
ASTRONOMY, IN THE CHAIRS SET UP BY THE NOBLE
AND LEARNED SIR HENRY SAVILE, IN THE UNIVERSITY
OF OXFORD. LESSON I.**

I SUPPOSE (MOST egregious Professors) you know already that by Geomerry (though the word import no more but the measuring of Land) is understood no less the measuring of all other Quantity, then that of Bodies. And though the Definition of Geometry serve not for proof, nor enter into any Geometricall Demonstration, yet for understanding of the Principles of the Science, and for a Rule to judge by, who is a Geometrician, and who is not, I hold it necessary to begin therewith.

Geometry is the Science of determining the quantity of any thing, not measured, by comparing it with some other Quantity, or Quantities measured. Which Science therefore whosoever shall go about to teach, must first be able to tell his Disciple what Measuring or Dimension is; by what each several kind of Quantity is Measured; what Quantity is, & what are the several kinds thereof. Therefore as they who handle any one part of Geometry, determine by Defiaition the signifie cation of every word whi^{ch} they make the Subject, or Praedicate of any Theoreme they undertake to demonstrate; so must he which intendeth to write a whole body of Geometry, Define and Determine the meaning of whatsoever word belongeth to the whole Science; The design of Euclid was to demonstrate the Properties of the five regular bodies mentioned by Plato; in which Demonstrations there was no need to alledge for Argument the Definition of

Quantity, which it may be was the cause he hath not any where Defined it, but done what he undertook without it. And though having perpetually occasion to speak of measure, he hath not Defined Measure; yet instead thereof he hath in the beginning of his first Element, assumed an Axiome which serveth his turn sufficiently, as to the measure of lines, which is the eighth Axiome; That those things which lye upon one another all the way (called by him) are equall. Which Axiome is nothing else but a description of the Art of Measuring Length, and Superficies. For this can have no place in solid bodies, unless two bodies could at the same time be in one place. But amongst the Principles of Geometry universall, the Definitions are necessary, both of Quantity and Dimension.

Quantity is that which is signified by what we answer to him that asketh, How much any thing is, and thereby determine the magnitude thereof. For magnitude being a word indefinite, if a man ask of a thing Quantum est, that is, How much it is; we do not satisfie him by saying it is magnitude or quantity, but by saying it is Tantum, so much. And they that first called it in Greek, and in Latine Quantity, might more properly have called it, in Latine Tantity, and in Greek ; and we, if we allowed our selves the Eloquence of the Greeks and Latines, should call it the So-muchness.

There is therefore to every thing concerning which a man may ask without absurdity how much it is, a certain Quantity belonging; determining the magnitude to be so much. Also wheresoever there is more and less, there is one kinde of Quantity or other. And first, there is the Quantity of Bodies, and that of three kindes; Length, which is by one way of Measuring; Superficies made of the complication of two Lengths, or the Measure taken, two wayes; and Solid which is the complication of three lengths, or of the measure taken three wayes; for breadth or thickness are but other Lengths. And the Science of Geometry so far forth as it contemplateth Bodies onely, is no more but by Measuring the length of one

or more lines, and by the position of others known in one and the same Figure, to Determine by ratiocination, how much is the Superficies; and by Measuring Length, Breadth, and Thickness, to determine the Quantity of the whole Body. Of this kinde of Magnitudes and Quantities the Subject is Body.

And because for the computing of the Magnitudes of Bodies, it is not necessary that the Bodies themselves should be present (the Ideas and memory of them supplying their presence) we reckon upon those Imaginary Bodies, which are the Quantities themselves, and say the length is so great, the breadth so great, &c. which in truth is no better then to say the length is so long, or the breadth so broad, &c. But in the mind of an intelligent man it breedeth no mistake.

Besides the Quantity of Bodies, there is a Quantity of Time. For seeing men, without absurdity do ask how much it is; by answering *Tantum*, so much, they make manifest there is a quantity that belongeth unto Time, namely, a Length. And because Length cannot be an accident of Time, which is it self an accident, it is the accident of a Body; and consequently the length of the Time, is the Length of the Body; by which Length or Line, we determine how much the Time is, supposing some Body to be moved over it.

Also we not improperly ask with how much Swiftness a Body is moved; and consequently there is a Quantity of Motion or Swiftness, and the measure of that Quantity is also a line. But then again, we must suppose another motion, which determineth the time of the former. Also of Force there is a Question of How much, which is to be answered by *So much*; that is, by Quantity. If the Force consist in Swiftness, the Determination is the same with that of Swiftness, namely, by a Line; if in Swiftness and Quantity of Body joyntly, then by a Line and a Solid; or if in quantity of Body onely (as Weight) by a Solid onely.

So also is Number Quantity; but in no other sense then as a line is Quantity divided into equall parts.

Of an Angle, which is of two Lines whatsoever they be, meeting in one point the digression or openess in other points, it may be asked how great is that digression; This Question is answered also by Quantity. An Angle therefore hath Quantity, though it be not the subject of Quantity; for the body onely can be the subject, in which Body those line are marked.

And because two lines may be made to divaricate by two causes; one, when having one end common, and immoveable, they depart one from another at the other ends circularly, and this is called surply an Angle; and the Quantity thereof is the Quantity of the Arch, which the two lines intercept.

The other cause is the bending of a straight line into a circular or other crooked line, till it touch the place of the same line, whilst it was straight, in one onely point. And this is called an Angle of contingence. And because the more it is bent, the more it digresseth from the Tangent, it may be asked how much more? and therefore the answer, must be made by Quantity; and consequently an Angle of Contingence hath its Quantity as well as that which is called simply an Angle. And in case the digression of two such crooked lines from the Tangent be uniform as in Circles, the Quantity of their digression may be determined. For if a straight line be drawn from the point of Contact, the digression of the lesser Circle will be to the digression of the greater Circle, as the part of the line drawn from the point of Contact, and intercepted by the Circumference of the greater Circle is to the part of the same line intercepted by the Circumference of the Lesser Circle, or, which is all one, as the greater Radius is to the lesser Radius. You may guess by this what will become of that part of your last Book, where you handle the Question of the Quantity of an Angle of Contingence.

Also there lyeth a Question of how much Comparatively one magnitude is to another magnitude, as how much water is in a Tun in respect of the Ocean, how much in respect of a Pint; little in the first respect, much in the Latter. Therefore the Answer must be made by some respective Quantity. This respective Quantity is called Ratio and Proportion, and is determined by the Quantity of their differences; and if their differences be compared also with the Quantities themselves that differ, it is called simply Proportion, or Proportion Geometricall. But if the differences be not so compared, then it is called Proportion Arithmetically. And where the difference is none, there is no Quantity of the Proportion, which in this case is but a bare comparison.

Also concerning Heat, Light, and divers other Qualities, which have degrees, there lyeth a question of how much, to be answered by a so much, and consequently they have their Quantities, though the same with the Quantity of Swiftnesse: because the intensions and remissions of such Qualities are but the intensions and remissions of the Swiftnesse of that motion by which the Agent produceth such a quality. And as Quantity may be considered in all the operations of Nature, so also doth Geometry run quite thorow the whole body of Naturall Philosophy.

To the Principles of Geometry the definition appertaineth also of a Measure, which is this, One Quantity is the Measure of another Quantity, when it, or the Multiple of it, is Coincident in all points, with the other Quantity. In which Definition in stead of that of Euclid, I put Coincidence. For that superposition of Quantities by which they render the word cannot be understood of Bodies, but only of Lines and Superficies. Nevertheless many Bodies may be Coincident successively with one and the same place, and that place will be their Measure, as we see practised continually in the measuring of Liquid Bodies, which Art of Measuring may properly be called, but not Superposition.

Also the definitions of Greater, Less, and Equall, are necessary Principles of Geometry. For it cannot be imagined that any Geometrician should demonstrate to us the Equality, and Inequality of magnitudes, except he tell us first what those words do signifie. And it is a wonder to me' that Euclide hath not any where defined what are Equals, or at least, what are Equall Bodies, but serveth his turn throughout with that forementioned , which hath no place in Solids, nor in Time, nor in Swiftness, nor in Circular, or other crooked lines; and therefore no wonder to me, why Geometry hath not proceeded to the calculation neither of crooked lines, nor sufficiently of Motion, nor of many other things, that have proportion to one another.

Equall Bodies, Superficies, and Lines are those of which every one is capable of being co-incident with the place of every one of the rest. And Equall Times wherein with one and the same Motion Equall lines are described. And Equally Swift are those Motions by which we run over equall spaces in any time determined by any other motion. And universally all Quantities are Equall, that are measured by the same number of the same Measures.

It is necessary also to the Science of Geometry, to define what Quantities are of one and the same kind, which they call Homogeneous; the want of which definitions hath produced those wranglings (which your Book De Angulo Contactus will not make to cease) about the Angle of Contingence.

Homogeneous quantities are those which may be compared by () application of their Measures to one another; So that Solids and Superficies, are Heterogeneous quantities, because there is no coincidence or application of those two dimensions.

No more is there of Line and Superficies, nor of Line and Solid, which are therefore Heterogeneous. But Lines and Lines, Superficies and Superficies, Solids and Solids, are Homogeneous.

Homogeneous also are Line, and the Quantity of Time; because the Quantity of Time is measured by application of a Line to a Line; for though Time be no Line, yet the Quantity of Time is a Line, and the length of two Times is compared by the length of two Lines.

Weight, and Solid have their Quantity Homogeneous, because they measure one another by application, to the beam of a Ballad.... Line and Angle simply so called have their Quantity Homogeneous, because their measure is an Arch or Arches of a Circle applicable in every point to one another.

The Quantity of an Angle simply so called, and the Quantity of an Angle of Contingence are Heterogeneous. For the measures by which two Angles simply so called are compared, are in two coincident Arches of the same Circle; but, the measure by which an Angle of Contingence is measured, is a straight line intercepted between the point of Contact, and the Circumference of the Circle; and therefore one of them is not applicable to the other; and consequently, of these two sorts of Angles, the Quantities are Heterogeneous. The Quantities of two Angles of Contingence are Homogeneous; for they may be measured by the of two Lines, whereof one extreame is common, namely, the point of Contact, the other Extreames, are in the Arches of the two Circles.

Besides this knowledge of what is Quantity and Measure, and their severall sorts, it behoveth a Geometrician to know why, and of what they are called Principles. For not every Proposition that is evident, is therefore a Principle. A Principle is the beginning of something. And because Definitions are the beginnings or first Propositions of Demonstration, they are therefore called Principles, Principles, I say, of Demonstration. But there be also necessary to the teaching of Geometry other Principles, which are not the beginnings of Demonstration, but of Construction, commonly called Petitions; as that it may be granted that a man can draw a straight Line, and

produce it; and with any Radius; on any Center describe a Circle, and the like. For that a man may be able to describe a square, he must first be able to draw a straight line; and before he can describe an Aequilaterall Triangle, he must be able first to describe a Circle. And these Petitions are therefore properly called Principles (not of Demonstration, but) of Operation. As for the commonly received third sort of Principles, called Common Notions, they are Principles, onely by permission of him that is the Disciples; who being continuous, and comming not to cavill but to learn, is content to receive them (though Demonstrable) without their Demonstrations. And though Definitions be the onely Principles of Demonstration, yet it is not true that every Definition is a Principle. For a man may so precisely determine the signification of a word, as not to be mistaken, yet may his Definition be such, as shall never serve for proof of any Theoreme, nor ever enter into any demonstration (such as are some of the Definitions of Euclide) and consequently can be no beginnings of Demonstration, that is to say, no Principles.

All that hitherto hath been said, is so plain and easie to be understood, that you cannot (most Egregious Professors) without discovering your ignorance to all men of reason, though no Geometricians, deny it. And the same (saving that the words are all to be found in Dictionaties) new; also to him that means to learn, not onely the Practice, but also the Science of Geometry necessary, and (though it grieve you) mine. And now I come to the Definitions of Euclide.

The first is of a Point. &c. Signum est, ejus est pars nulla, that is to say, a. Marke is that of which there is no part. Which definition, not onely to a candid, but also to a rigid construer is sound and usefull. But to one that neither will interpret candidly, nor can interpret accurately, is neither usefull nor true. Theologers say the Soul hath no part, and that an Angel hath no part, yet do not think that Soul or Angel is a point. A mark, or as some put

instead of it , which is a mark with a hot Iron, is visible; if visible then it hath Quantity, and consequently may be divided into parts innumerable. That which is indivisible is no Quantity; and if a point be not Quantity, seeing it is neither substance nor Quality, it is nothing. And if Euclide had meant it so in his definition, (as you pretend he did) he might have defined it more briefly, (but ridiculously) thus, a Point is nothing. Sir Henry Savile was better pleased with the Candid interpretation of Proclus, that would have it understood respectively to the matter of Geometry. But what meaneth this respectively to the matter of Geometry? It meaneth this, that no Argument in any Geometricall demonstration should be taken from the Division, Quantity, or any part of a Point; which is as much as to say, a Point is that whose Quantity is not drawn into the demonstration of any Geometricall conclusion; or (which is all one) whose Quantity is not considered.

An accurate interpreter might make good the definition thus, a Point is that which is undivided; and this is properly the same with *cujus non est pars*: for there is a great difference between undivided, and in divisible, that is, between *cujus non est pars*, and *cujus non potest esse pars*. Division is an Act of the understanding; the understanding therefore is that which maketh parts, and there is no part where there is no consideration bat of one. And consequently Euclides definition of a Point, is accurately true, and the same with mine, which is, that a Point is that Body whose Quantity is not considered. And considered, is that (as I have defined it, Cha. at the end of the third Article) which is not put to account in demonstration.

Euclide therefore seemeth not to be of your opinion, that say a Point is nothing. But why then doth he never use this definition in the Demonstration of any Proposition? Whether he useth it expressly or no, I remember not; but the 16th. Proposition of the third Book without the force of this definition is undemonstrated.

The second Definition is of a Line. . *Linea est longitudo latitudinis* expers, a Line is length which hath no breadth; and if candidly interpreted, sound enough, though rigorously, not so. For to what purpose is it to say Length not Broad, when there is no such thing as a broad length. One Path may be broader then another Path, but not one Mile then another Mile; and it is not the Path but the Mile which is the ways Length. If therefore a man have any ingenuity he will understand it thus, That' a Line is a Body whose length is considered without its breadth, else we must say absurdly a broad length; or untruly, that there be bodies which have length and yet no breadth; and this is the very sense which Apollonius (saith Proclus) makes of this Definition; when we measure, sayes he, the length of a way, we take not in the breadth or depth, but consider onely one Dimension. See this of Proclus cited by Sir Henry Saviles where you shall finde the very word consider.

The fourth Definition is of a straight line, thus , &c. *Recta linea est quae ex aequo sua ipstus puncta inter jacet*. A straight line is that which lieth equally (or perhaps evenly) between its own Points. This Definition is inexcusable. Between what Points of its own can a straight line lye but between its extreams? And how lies, it evenly between them, unless it swarve no more from some other line which hath the same Extreams, one way then another? And then why are not between the same Points both the lines straight? How bitterly, and with what insipide justs, would you have reviled Euclide for this, if living now he had written a *Loviathan*. And yet there is somewhat in this Definition to help a man, not onely to conceive the nature of a straight line (for who doth not conceive it?) but also to express it. For he meant perhaps to call a straight line that which is all the way from one Extream to another, equally distant from any two or more such Lines as being like and equall have the same Extreams. So the Axis of the Earth is all the way equally distant from the circumference of any two or more

Meridians. But then before he had defined a straight line, he should have defined what lines are like, and what are equall. But it had been best of all, first to have defined crooked lines, by the possibility of a diduction or setting further asunder of their extrems; and then straight Lines, by the impossibility of the same.

The seventh Definition, which is that of a plain Superficies, hath the same fault.

The Eighth is of a plain Angle. , &c. *Angulus Planus est duarum Linearum in plano se mutuo tangentium, & non indirectum jacentium, alterius ad alteram inclinatio.* A Plain Angle is the inclination one towards another of two lines that touch one another in the same Plain, and lye not in the same straight line: Besides the faults here observed by Mr. Henry Savile, as the clause of not lying in the same straight line, and the obscurity or equivocation of the word inclination, there is yet another, which is, that by this Definition two Right Angles together taken, are no Angle; which is a fault which you somewhere (asking leave to use the word Angle, acknowledge, but avoid not. For in Geometry, where you confesse there is required all possible accurateness, every is a fault. Besides you see by this Definition, that Euclide is not of your, but of Clavius his opinion. For it is manifest that the two lines which contain an Angle of Contact, incline one towards another, and come together in a Point, and lye not in the same streight line, and consequently make an Angle.

The thirteenth Definition is exact, but makes against your Doctrine, that a Point is nothing. Examine it. . *Terminus est quod alicujus extremum est.* A Term or Bound is that which is the Extream of any thing We had before, The extrems of a Line are Points. But what is in a Line the extream, but the first or last part, though you may make that part as small as you will? A point is therefore a part, and nothing is no extream.

The fourteenth, *Figura est (subaudi Quantitas) quae ab aliquo, vel aliquibus terminis undi{que} continetur five clauditur*. A Figure is Quantity contained within some bound or bounds. Or shortly thus, A Figure is Quantity every way determined, is in my opinion as exact a Definition of a Figure as can possibly be given, though it must not be so in yours. For this determination is the same thing with circumscription; and whatsoever is any where (U B I cun{que}) definitivè is there also circumscriptivè; and by this means, the distinction is lost, by which Theologers, when they deny God to be in any place, save themselves from being accused of saying he is no where; for that which is no where is nothing. This definition of Euclide cannot therefore possibly be embraced by you that carry double, namely, Mathematicks and Theology. For if you reject it, you will be cast out of all Mathematick Schooles; and if you maintain it, from the Society of all School-Divines, and lose the thanks of the Favour you have shewn (you the Astronomer) to Bishop Bramhall.

The fifteenth is of a Circle, , &c. A Circle is a plain Figure comprehended by one line which is called the Circumference, to which Circumference all the straight lines drawn from one of the points within the Figure, are equall to one another. This is true. But if a man had never seen the generation of a Circle by the motion of a Compass or other aequivalent means, it would have been hard to perswade him, that there was any such Figure possible. It had been therefore not amiss first to have let him see that such a Figure might be described. Therefore so much of Geometry is no part of Philosophy, which seeketh the proper passions of all things in the generation of the things themselves.

After the fifteenth till the last or thirty fifth Definition all are most accurate, but the last, which is this, Parallel straight lines are those which being in the same Plane, though infinitely produced both wayes shall never meet. Which is lesse accurate. For how shall a man know that there be

straight lines, which shall never meet, though both wayes infinitely produced? Or how is the Definition of Parallels, that is, of lines perpetually aequidistant good, wherein the nature of aequidistance is not signified? Or if it were signified, why should it not comprehend, as well the Parallelism of Circular and other crooked lines, as of streight, and as well of Superficies, as of lines? By Parallels is meant aequidistant both Lines and Superficies, and the word is therefore not well defined without defining first equality of distance. And because the distance between two lines or Superficies, is the shortest line that can joyn them, there either ought to be in the definition, the shortest distance, which is that of the Perpendicular, and without inclination, or the distance in equall inclination, that is, in equall Angles. Therefore if Parallels be defined to be those Lines or Superficies, where the Lines drawn from one to an other in equal Angles be equal, the Definition, as to like Lines, or like Superficies, will be Universall and Convertible. And if we add to this Definition, that the equall Angles be drawn not opposite wayes, it will be absolute, and Convertible in all Lines and Superficies; and the definition will be this, Parallels are those Lines and Superficies between which every line drawn, in any Angle, is equall to any other line drawn in the same Angle the same way. For by this Definition the distance between them will perpetually be equall, and consequently they will never come nearer together, how much, or which way soever they be produced. And the converse of it will be also true, If two Lines, or two Superficies be Paralle, and a straight line be drawn from one to the other, any other straight line, drawn from one to the other in the same Angle, and the same way, will be equall to it. This is manifestly true, and (most egregious Professors) new, at least to you.

And thus much for the Definitions placed before the first of Euclides Elements.

Before the third of his Elements is this Definition. In circulo aequaliter distare à centro rectae lineae dicuntur, cum prependiculares quae à centro in ipsas ducuntur sunt- aequales. In a circle two straight Lines are said to be equally distant from the Center, upon which the perpendiculars drawn from the Center are equall. This is true; but it is rather an Axiome then a Definition, as being demonstrable that the Perpendicular is the measure of the distance between a Point and a straight or crooked Line.

Before the fifth Element the first Definition is of a Part. Pars est magnitudo magnitudinis, minor majoris, cum minor metitur majorem. A Part is one magnitude of another, the lesse of the greater, when the lesse measureth the greater. From which Definition it followeth, that more then the half is not a part of the whole. But because Euclide meaneth here an Aliquot part, as a half, a third, or a fourth, &c. It may pass for the Definition of a measure under the name of part; as thus, a Measure is a Part of the whole, when multiplyed, it may be equall to the whole, though properly a Measure is externall to the thing measured, and not the Aliquot part it self; but equall to an Aliquot part.

But the third Definition is intollerable, It is the definition of \propto , in Latin Ratio, in English Proportion, in this manner; . Ratio est duarum magnitudinum ejusdem generis mutua quaedam secundum quantitatem babitudo. Proportion is a certain mutuall habitude in Quantity, of two magnitudes of the same kinde, one to another. First, we have here ignotum per ignoti^{us}; for every man understandeth better what is meant by Proportion then by Habitude. But it was the phrase of the Greeks when they named like Proportions, to say, the first to the second \propto , id est, Ita se habet, and in English, is as, the third to the fourth. As for Example (in the Proportions of two to four, and three to six) to say two to four \propto , id est, ita se habet, id est, is as, three to six. From which phrase Euclide made this his Definition of Proportion by \propto , which the Latines translate quaedam habitude.

Quaedam in a Definition is a most certain note of not understanding the word defined; And in Greek is much worse; for to render rightly the Greek definition, we are to say in English, that Proportion is a whatshall-I-call-it isaessee, or soness of two magnitudes &c. Then which nothing can be more unworthy of Euclide. It is as bad as any thing was ever said in Geometry by Orontius, or by Dr. Wallis, That Proportion is Quantity compared, that is to say, little or great in respect of some other Quantity (as I have above defined it) is I think intelligible.

The fourth is, . *Proportio verò est rationum similitudo*. Here we have no one word by which to render ; for our word Proportion, is already bestowed upon the rendring of . Neverthesse the Greek may be translated into English thus, Iterated Proportion is the similitude of Proportions. But Iterated Proportion is the same with eadem Ratio. To what purpose then serveth the sixth Definition, which is of eadem Ratio? For and eadem Ratio, and *Similitudo Rationum*, are the same thing, as appeareth by Euclide himself; where he defines those Quantities, that are in the same Proportion by . Therefore the sixth Definition is but a Lemma, and assumed without demonstration.

The fourteenth, *Compositio Rationis est sunptio Antecedentis cum Consequente, ceu unius, ad ipsum consequentem*. To Compound Proportion, is to take both Antecedent, and Consequent together, as one magnitude, and compare it to the consequent, Is good; though he might have compared it as well with the Antecedent; For both wayes it had been a Composition of Proportion. We are to note here, that the Composition defined in this place by Euclide, is not adding together of Proportions, but of two Quantities that have Proportion. And therefore it is not the same Composition which he defineth in the fourth place before the sixth Element; for there

He defineth the addition of Proportion to another Proportion in this manner , &c. A Proportion is said to be compounded of Proportions, when their Quantities multiplies into one another make a Proportion; as when we would compound or add together, the Proportions, of three to two, and of four to five, we must multiply three and four, which maketh twelve, and two and five which maketh ten. And then the Proportion of twelve to ten, is the sum of the Proportions, of three to two, and of four to five; which is true; but not a definition; for it may and ought to be demonstrated. For to define what is addition of two Proportions (which are alwayes in four Quantities, though sometimes one of them be twice named) we are to say, that they are then added together when we make the second to another in the same Proportion, which the third hath to the fourth.

And thus much of the Definitions; of which, some, very few, you see are faulty; the rest either accurate, or good enough if well interpreted. For before the rest of the Elements all are accurate, notwithstanding, that you allow not for good any definition in Geometry that hath in it the word motion: of which there be divers before the Eleventh Element. But I must here put you in minde, that Geometry being a Science, and all Science proceeding from a precognition of causes, the definition of a Sphere, and also of a Circle, by the generation of it, that is to say, by motion, is better then by the equality of distance from a Point within.

The second sort of Principles, are those of Construction, usually called Postulata, or Petitions. For as for those notions communes, called Axiomes, they are from the definitions of their terms demonstrable, though they be so evident as they need not demonstration. These Petitions are by Euclide called , such as are granted by favour, that is, simply Petitions whereas by Axiome is understood that which is claimed as due. So that between and there is this other difference, that this later is simply a Petition, the former a Petition of Right.

Of Petitions simply, the first is, That from any Point to any Point may be drawn a straight Line. The second, That a finite straight Line may be produced. The third, That upon any Center, at any distance may be described a Circle. All which are both evident, and necessary to be granted.

And by all these a man may easily perceive that Euclide in the definitions of a Point, a Line, and a Superficies, did not intend that a Point should be Nothing, or a Line be without Latitude, or a Superficies without Thickness, for if he did, his Petitions are not onely unreasonable to be granted, but also impossible to be performed. For Lines are not drawn but by Motion; and Motion is of Body only. And therefore his meaning was, that the Quantity of a Point, the Breadth of a Line, and the Thickness of a Superficies were not to be considered, that is to say, not to be reckoned in the demonstration of any Theoreme concerning the Quantity of Bodies, either in Length, Superficies, or Solid.

**OF THE FAULTS THAT OCCURRE IN DEMONSTRATION.
TO THE SAME EGREGIOUS PROFESSORS OF THE
MATHEMATICKS IN THE UNIVERSITY OF OXFORD.
LESSON II.**

THERE BE BUT two causes from which can spring an error in the demonstration of any conclusion in any Science whatsoever. And those are Ignorance or want of understanding, & Negligence. For as in the adding together of many and great Numbers, he cannot fail, that knoweth the Rules of Addition, and is also all the way so carefull, as not to mistake one number, or one place for another; so in any other Science, he that is perfect in the Rules of Logick, and is so watchfull over his Pen, as not to put one word for another, can never fail of making a true, though not perhaps the shortest and easiest demonstration.

The Rules of Demonstration are but of two kindes; One, that the Principles be true and evident Definitions; the other, that the Inferences be necessary. And of true and evident definitions, the best are those which declare the cause or generation of that Subject, whereof the proper passions are to be demonstrated. For Science is that knowledge which is derived from the comprehension of the cause. But when the cause appeareth not, then may, or rather must we define some known property of the Subject, and from thence derive some possible way, or wayes of the generation. And the more wait of generation are explicated, the more easie will be the derivation of the Properties; whereof some are more immediate to one, some to another generation. He therefore that proceedeth from untrue, or not undefined definitions, is ignorant of that he goes about; which is an il-

favoured fault, be the matter he undertaketh easie or difficult; because he was not forced to undergo a greater charge then he could carry through. But he that from right definitions maketh a false conclusion, erreth through humane frailty, as being less awake, more troubled with other thoughts, or more in haste when he was in writing. Such faults, unless they be very frequent, are not attended with shame, as being common to all men, or are at least less ugly then the former, except then, when he that committeth them reprehendeth the same in other men. For that is in every man intolerable, which he cannot tolerate in another. But to the end that the faults of both kinds may by every man be well understood, it will not be amiss to examine them by some such Demonstrations, as are publicly extant. And for this purpose I will take such as are in mine and in your Books, and begin with your Elenchus of the Geometry contained in my Book de Corpore; to which I will also joyn your Book lately set forth concerning the Angle of Contact, Conique sections, and your Arithmetica Infinitorum; and then examine the rest of my Philosophy, and yours that oppugne it. For I will take leave to consider you both every where, as one Author, because you publicly declare your approbation of one anothers doctrine.

My first Definition is of a Line, of Length, and of a Point; The way (say I) of a Body moved, in which magnitude (though it always have some magnitude) is not considered, is called a Line; and the space gone over by that motion, Length, or one and a simple Dimension. To this Definition you say, First, what Mathematician did ever thus define a Line or Length? Whether you call in others for help or testimony, it is not done like a Geometrician; for they use not to prove their conclusions by witnesses, but relye upon the strength of their own reason; and when your witnesses appear, they will not take your part. Secondly, you grant that what I say is true, but not a Definition. But to tell you truly what it is which we call a

Line, is to define a Line. Why then is not this a Definition? Because (say you in the first place) it is not a reciprocall proposition. But by your favour it is reciprocall. For not only the way of a Body whose Quantity is not considered, is a Line; but also every Line is (or may be conceived to be) the way of a Body so moved. And if you object that there is a difference between is and may be conceived to be, Euclide whom you call to your aid, will be against you in the fourteenth Definition before his eleventh Element; Where he defines a Sphere just as convertibly as I define a Line; except you think the Globes of the Sun and Stars cannot be Globes, unless they were made by the circumduction of a Semicircle; And again in the eighteenth definition, which is of a Cone, unless you admit no Figure for a Cone, which is not generated by the Revolution of a Triangle; And again, in the twentieth Definition, which is of a Cylinder, except it be generated by the circumvolution of a Parallelogram. Euclide saw that what proper passion soever should be derived from these his Definitions, would be true of any other Cylinder, Sphere, or Cone, though it were otherwise generated; And the description of the generation of any one being by the imagination applicable to all (which is equivalent to convertible) he did not believe that any rationall man could be missed by learning Logick, to be offended with it. Therefore this exception proceedeth from want of understanding, that is, from ignorance of the nature, and use of a Definition.

Again, you object and ask What need is there of motion, or of Body moved, to make a man understand what is a Line? Are not Lines in a Body at rest, as well as in a Body moved? And is not the distance of two resting points Length, as well as the measure of the passage? Is not Length one and a simple dimension, and one and a simple dimension Line? Why then is not Line and Length all one? See how impertinent these questions are. Euclide defines a Sphere to be a Solid Figure described by the revolution of a Semicircle, about the unmoved Diameter. Why do you not ask what need

there is to the understanding of what a Sphere is, to bring in the motion of a Semicircle? Is not a Sphere to be understood without such motion? Is not the Figure so made, a Sphere without this motion? And where he defines the Axis of a Sphere to be that unmoved Diameter, may not you ask, whether there be no Axis of a Sphere, when the whole Sphere, Diameter and all is in motion? But it is not my purpose to defend my definition by the example that of Euclide. Therefore first, I say, to me howsoever it may be to others, it was fit to define a Line by Motion. For the generation of a Line is the Motion that describes it. And having defined Philosophy in the beginning, to be the knowledge of the properties from the generation, it was fit to define it by its generation. And to your question, Is not distance Length? I answer, that though sometimes distance be aequivallent to Length, yet certainly the distance between the two ends of a thread wound up into a Clew is not the length of the thread; for the length of the thread is equall to all the windings whereof the Clew is made. But if you will needs have distance and length to be all one, tell me of what, the distance between any two Points is the Length. Is it not the length of the way? And how is that called Way, which is not defined by some motion? And have not severall wayes between the same places, as by Land and by Water, severall lengths? But they have but one distance, because the distance is the shortest way. Therefore between the length of the Path, and the distance of the Places, there is a reall difference in this case, and in all cases a difference of the consideration. Your objection, that Line is Longitude, proceeds from want of understanding English. Do men ever ask what is the Line of a thread, or the Line of a Table, or of any other Body? Do they not alwayes ask what is the length of it? And why, but because they use their own judgements, nor yet corrupted by the subtilty of mistaken Professors. Euclide defines a Line, to be length without breadth. If those terms be all one, why said he not that a Line, is a Line without breadth? But what Definition of a Line give you?

None. Be contented then with such as you receive, and with this of mine, which you shall presently see is not amiss.

Your next objections are to my Definition of a Point. Which Definition adhereth to the former in these words, and the Body it self is called a Point. Here again you call for help; *Quis unquam mortalium, &c.* What mortall man, what sober man did ever so Define a Point? 'Tis well, and I take it to be an honour to be the first that do so. But what objection do you bring against it? This, that a point added to a Point (if it have magnitude) makes it greater. I say it doth so, but then presently it loseth the name of a Point, which name was given to signifie that it was not the meaning of him that us'd it in demonstration, to add, subtract, multiply, divide, or any way compute it. Then you come in with perhaps you will say though it have magnitude, that magditude is not considered. You need not say perhaps. You know I affirm it; and therefore your Argument might have been left out, but that it gave you occasion of a digression into scurvie language.

And whereas you ask why I defined not a Point thus, *Punctum est corpus quod non consideratur esse corpus, & magnum quod non consideratur esse magnum.* I will tell you why. First, because it is not Latine. Secondly, because when I had defined it by *corpus*, there was no need to Define it again by *magnum*. I understand very well this language, *Punctum est corpus, quod non consideratur ut corpus.* A Point is a Body not considered as Body. But *Punctum, est corpus, quod non consideratur esse corpus, vel esse magnum,* is not Latine, nor the version of it, A Point is a Body which is not considered to be a Body, English. My Definition was, that a Point is that Body whose magnitude is not considered, not reckoned, not put to account in Demonstration. And I exemplified the same by the Body of the Earth describing the Eclipcique Line; because the magnitude is not there reckoned nor chargeth the Eccliptique Line with any breadth. But I perceive you understand not what the word consideration signifieth, but take it for

comparison or relation; and say I ought to define a Point simply, and not by relation to a greater Body; as if to reckon, and to compare were the same thing. *Omnia mihi (saith Cicero) provisā & cousiderata sunt.* I have provided and reckoned every thing. There is a great difference between Reckoning and Relation.

Again, you ask why *Corpus motum*, a Body moved. Ile tell you; because the was necessary for the generation of a Line. And though after the generation of the Line, the Point should rest, yet it is not necessary from this Definition that it should be no more a Point; nor when Euclide defines a Sphere by the circumduction of a Semicircle upon an Axis that resteth, doth it follow from thence when the Sphere, Axis, Center and all (as that of the Earth) is moved from place to place, that it is no more an Axis.

Lastly, you object that motion is accidentary to a Point, and consequently not essentiall, nor to be put into the Definition. And is not the circumduction of a Semicircle accidentary to a Sphere? Or do you think the Sphere of the Sun was generated by the revolution of a Semicircle? And yet it was thought no fault in Euclide to put that motion into the Definition of a Sphere.

The conceit, you have concerning Definitions, that they must explicate the essence of the thing defined, and must consist of a genus, and a difference, is not so universally true as you are made believe, or else there be very many insufficient Definitions that pass for good with you in Euclide. You are much deceived if you think these wofull notions of yours, and the Language that doth every where accompany them, shew handsomely together. Or that such grounds as these be able to sustain so many, and so haughty reproaches as you advance upon them, so as they fall not (as you shall see immediately) upon your own head. I say a point hath Quantity, but not to be reckoned in Demonstrating the properties of Lines,

Solids, or Superficies; You say it hath no Quantity at all, but is plainly Nothing.

The first of the Petitions of Euclide is, that a Line may be drawn from Point to Point at any distance. The second, that a straight Line may be produced. The third, that on any Center a circle may be described at any distance. And the eighth Axiome (which Sir H. Savile observes to be the foundation of all Geometry) is this, *Quae sibi mutuo congruunt, &c.* Those things that are applyed one to another in all Points, are equall. All or any of these Principles being taken away, there is not in Euclide one Proposition Demonstrated, or Demonstrable. If a Point have not Quantity, a Line can have no Latitude; and because a Line is not drawn but by motion, by motion of a Body, and Body imprinteth Latitude all the way, it is impossible to draw or produce a straight Line, or to describe a circular Line without Latitude. Also if a Line have no Latitude, one straight Line cannot be applyed to another. To them therefore that deny a Point to have Quantity, that is, a Line to have Latitude, the forenamed Principles are not possible, and consequently no proposition in Geometry is demonstrated, or demonstrable. You therefore that deny a Point to have Quantity, and a Line to have Breadth, have nothing at all of the Science of Geometry. The practise you may have; but so hath any man that hath learned the bare Propositions by heart; but they are not fit to be Professors either of Geometry, or of any other Science that dependeth on it. Some man perhaps may say that this controversie is not much worth, and that we both mean the same thing. But that man (though in other things prudent enough) knoweth little of Science and Demonstration. For Definitions are not onely used to give us the Notions of those things whose appellations are defined; for many times they that have no Science have the Ideas of things more perfect then such as are raised by Definitions. As who is there that understandeth not better what a straight Line is, or what Proportion is, and what many

other things are without Definition, then some that set down the Definitions of them. But their use is, when they are truly and clearly made, to draw Arguments from them for the Conclusions to be proved. And therefore you that in your following censures of my Geometry, take your Argument so often from this, That a Point is nothing, and so often revile me for the contrary, are not to be allowed such an excuse. He that is here mistaken, is not to be called Negligent in his Expression, but Ignorant of the Science.

In the next place, you take exceptions to my Definition of Equall Bodies, which is this, *Corpora aequalia sunt quae eundem locum possidere possunt*. Equall bodies are those which may have the same place. To which you object impertinently, that I may as well define a man to be He that may be Prince of Transilvania, Wittily, as you count wit. Formerly in every Definition, you exacted an Explication of the Essence. You are therefore of opinion that the Possibility of being Prince of Transilvania, is no less Essentiall to a man, then the Possibility of the being of two Bodies successively in the same place, is Essentiall to Bodies equall.

You take no notice of the twenty third Article of this same Chapter, where I define what it is we call Essence; namely, that Accident, for which we give the thing its name. As the Essence of a man is his Capacity of reasoning, the Essence of a white-body, whiteness, &c. because we give the name of man to such Bodies as are capable of Reasoning, for that their capacity; and the name of White to such Bodies as have that colour, for that colour. Let us now examine why it is that men say Bodies are one to another Equall; and thereby we shall be able to determine whether the possibility of having the same place, be Essentiall or not to Bodies equall, and consequently whether this Definition be so like to the Defining of a man by the Possibility of being Prince of Transilvania, as you say it is. There is no man (besides such Egregious Geometricians as your selves) that inquireth the equality of two bodies, but by measure. And for Liquid Bodies, or the

Aggregates of innumerable small Bodies, men (men I say) measure them by putting them one after another into the same vessell, that is to say, into the same place (as Aristotle defines place) or into the space determined by the vessell, as I define place. And the Bodies that so fill the vessell, they acknowledge, and receive for equall. But though, when hard Bodies cannot be so measured, without the incommodity, or trouble of altering their Figure, they then enquire (if the Bodies are both of the same kind) their equality by weight, knowing (without your teaching) that equall bodies of the same nature, weigh Proportionably to their magnitudes; yet they do it not for fear of missing of the equality, but to avoid inconvenience, or trouble But you, (you I say) that have no Definition of Equalls, neither received from others, nor framed by your selves, out of your shallow meditation, and deep conceit of your own Wits, contend against the common light of Nature. So much is unheedy learning a hinderance to the knowledge of the truth, and changeth into Elves those that were beginning to be men.

Again, when men inquire the equality of two Bodies in length, they measure them by a common measure; in which measure they consider neither breadth nor thickness, but how the length of it agreeth; first, with the length of one of the Bodies, then with the length of the other. And both the Bodies whose lengths are measured, are successively in the same place under their common measure. Place therefore in Lines also, is the proper Index and discoverer of Equality, and Inequality. And as in length, so it is in breadth and thickness, which are but Lengths otherwise taken in the same Solid Body. But now when we come from this Equality, and Inequality of Lengths known by measure, to determine the Proportions of Superficies, and of Solids, by ratiocination, then it is that we enter into Geometry; for the making of Definitions, in whatsoever Science they are to be used, is that which we call *Philosophiaprima*. It is not the work of a Geometrician, as a

Geometrician, to Define what is Equality, or Proportion, or any other word he useth, though it be the work of the same man, as a man. His Geometricall part is, To draw from them, as many true and usefull Theoremes as he can.

You object secondly, That a Pyramis may be equall to a Cube, whilst it is a Pyramis. True, And so also whilst it is a Pyramis it hath a possibility by flexion and transposition of parts to become a Cube, and to be put into the place where another Cube equall to it was before. This is to argue like a child that hath not yet the perfect understanding of any Language.

In the third and fourth objection, you teach me to define Equall Bodies (it I will needs define them by place) by the Equality of place, and to say that Bodies are Equall that have Equall places. Teach others, if you can, to measure their grain, not by the same, but Equall Bushels.

In the fifth objection, you except against the word can, in that I say that Bodies are Equall, which can fill the same place. For the greater Body can (you say) fill the place of the less, though not reciprocally the less of the greater; It is true, that though the place of the less, can never be the place of the greater yet it may be filled by a part of the greater. But 'tis not then the greater Body that filleth the place of the less, but a part of it, that is to say, a less Body. Howsoever to take away from simple men this straw they stumble at, I have now put the Definition of Equal Bodies into these words, Equall Bodies are those whereof every one can fill the place of every other. And if my Definition displease you, propound your own, either of Equall Bodies, or of Equals simply. But you have none. Take therefore this of mine.

The sixth is a very admirable exception. What (say you) if the same Body can sometimes take up a greater, sometimes a lesser place, as by Rarefaction and Condensation? I understand very well that Bodies may be sometimes thin and sometimes thick, as they chance to stand closer together, or further from one another. So in the Mathematick-Schools, when you read

your Learned Lectures, you have a thick or thronging Audience of Disciples, which in a great Church, would be but a very thin company. I understand how thick and thin may be attributed to bodies in the Plurall, as to a company, but I understand not how any one of them is thicker in the School, then in the Church; or how any one of them taketh up a greater room in the School (when he can get in) then in the street. For I conceive the Dimensions of the Body, and of the Place, whether the place be filled with Gold or with Air, to be coincident and the same; and consequently both the Quantity of the Air, and the Quantity of the Gold to be severally equall to the Quantity of the place; and therefore also (by the first Axiome of Euclide) equall to one another; insomuch, as if the same Air should be by Condensation contained in a part of the place it had, the dimensions of it would be the same with the dimensions of part of the place, that is, should be less then they were, and by consequence the Quantity less. And then either the same body must be less also, or we must make a difference between greater Bodies, and Bodies of greater Quantity; which no man doth that hath not lost his wits by trusting them with absurd teachers. When you receive Salary, if the Steward give you for every shilling a piece of six pence, and then say, every shilling is condensed into the room of a six pence, I believe you would like this Doctrine of yours much the worse. You see how by your ignorance you confound the affairs of mankind, as far forth as they give credit to your opinions, though it be but little. For nature abhorres even empty words, such as are (in the meaning you assign them) Rarefying and Condensing. And you would be as well understood if you should say (coining words by your own power) that the same Body might take up sometimes a greater, sometimes a lesser place, by Wallifaction and Wardensation, as by Rarefaction and Condensation. You see how admirable this your objection is.

In the seventh objection you bewray another kind of Ignorance, which is the Ignorance of what are the proper works of the severall parts of Philosophy. Though it were out of doubt (say you) that the same Body cannot have several Magnitudes yet seeing it is matter of Natural Philosophy, nor hath any thing to do with the present business, to what purpose is it to mention it in a Mathematicall Definition? It seems by this, that all this while you think it is a piece of the Geometry of Euclide, no less to make the Definitions he useth, then to infer from them the Theorems he demonstrateth. Which is not true. For he that telleth you in what sense you are to take the Appellations of those things which he nameth in his discourse, teacheth you but his Language, that afterwards he may teach you his Art. But teaching of Language is not Mathematick, nor Logick, nor Physick, nor any other Science; and therefore to call a Definition (as you do) Mathematicall, or Physicall, is a mark of Ignorance (in a Professor) unexcusable. All Doctrine begins at the understanding of words, and proceeds by Reasoning till it conclude in Science. He that will learn Geometry must understand the Termes before he begin, which that he may do, the Master demonstrateth nothing, but useth his Naturall prudence onely, as all men do, when they endeavour to make their meaning clearly known. For words understood are but the seed, and no part of the harvest of Philosophy. And this seed was it, which Aristotle went about to sow in his twelve Books of Metaphysicks, and in his eight Books concerning the Hearing of Naturall Philosophy. And in these Books he defineth Time, Place, Substance or Essence, Quantity, Relation, &c. that from thence might be taken the Definitions of the most generall words for Principles in the severall parts of Science. So that all Definitions proceed from common understanding; of which, if any man rightly write, he may properly call his writing *Philosophia prima*, that is, the Seeds, or the Grounds of Philosophy. And this is the Method I have used, defining Place, Magnitude, and the

other the most generall Appellations in that part which I intitle *Philosophia prima*. But you now not understanding this, talk of Mathematicall Definitions. You will say perhaps that others do the same as well as you. It may be so. But the appeaching of others does not make your ignorance the less.

In the eighth place you object not, but ask me why I define equall Bodies apart. I will tell you. Because all other things which are said to be equall, are said to be so, from the equality of Bodies; as two lines are said to be equall, when they be coincident with the Length of one and the same Body; and equall Times, which are measured by equall Lengths of Body, by the same Motion. And the reason is, because there is no Subject of Quantity, or of Equality, or of any other accident but Body; all which I thought certainly was evident enough to any uncorrupted Judgement; and therefore, that I needed first to define Equality in the Subject thereof, which is Body, and then to declare in what sense it was attributed to Time, Motion, and other things that are not Body.

The ninth objection is an egregious cavill. Having set down the Definition of Equall Bodies, I considered that some men might not allow the attribute of Equality to any things, but those which are the Subjects of Quantity, because there is no Equality, but in respect of Quantity. And to speak rigidly, *Magnum & Magnitudo* are not the same thing; for that which is great, is properly a Body, whereof greatness is an Accident. In what sense therefore (might you object) can an Accident have Quantity? For their sakes therefore that have not Judgement enough to perceive in what sense men say the Length is so Long, or the Superficies so broad, &c. I added these words, *Eâdem ratione (quâ scilicet corpora dicuntur aequalia) Magnitudo magnitudini aequalis dicitur*, that is, in the same manner, as Bodies are said to be equal, their magnitudes also are said to be equall. Which is no more then to say, when Bodies are Equall, their Magnitudes also are called

Equall. When Bodies are Equall in Length, their Lengths are also called Equall. And when Bodies are Equall in Superficies, their Superficies are also called Equall. All which is common speech, as well amongst Mathematicians, as amongst common people; and (though improper) cannot be altered, nor needeth to be altered to intelligent men. Nevertheless I did think fit to put in that clause, that men might know what it is we call Equality, as well in Magnitudes as in Magnis, that is, in Bodies. Which you so interpret, as if it bore this sense, that when Bodies are Equall, their Superficies also must be Equall, contrary to your own knowledge, onely to take hold of a new occasion of reviling. How unhandsome, and unmanly this is, I leave to be judged by any Reader that hath had the fortune to see the world, and converse with honest men.

Against the fourteenth Article, where I prove that the same Body hath alwayes the same magnitude, you object nothing but this, that though it be granted, that the same Body hath the same magnitude, while it resteth, yet I bring nothing to prove that when it changeth place, it may not also change its Magnitude by being enlarged or contracted. There is no doubt, but to a Body (whether at rest or in motion) some Body may be added, or part of it taken away. But then it is not the same Body, unless the Whole, and the Part be all one. If the Schools had not set your wit awry, you could never have been so stupid as not to see the weakness of such objections. That which you add in the end of your objections to this eighth Chapter, that I allow not Euclide this Axiom gratis, that the Whole is greater then a Part, you know to be untrue

At my eleventh Chapter, you enter into dispute with me, about the nature of Proportion. Upon the truth of your Doctrine therein, and partly upon the truth of your opinions concerning the Definitions of a Point, and of a Line, dependeth the Question whether you have any Geometry, or none; and the truth of all the Demonstrations you have in your other Books, namely, of

the Angle of Contact, and Arithmetica Infinitorum. Here I say you enter, how you wil get out (your reputation saved) we shall se- hereafter.

When a man asketh what Proportion one Quantity hath to another, he asketh how great or how little the one is comparatively to, or in respect of the other. When a G-ometrician prefixeth before his Demonstrations a D — inition, he doth it not as a part of his Geometry, but of naturall evidence, not to be demonstrated by Argument, but to be understood in understanding the Language wherein it is set down; though the matter may nevertheless (if besides Geometry he have wit) be of some help to his Disciple to make him understand it the sooner. But when there is no -significant Definition prefixed (as in this case, where Euclides Definition of Proportion, That it is a whats-i-a-t habitu-e of two Quantities, &c. is in significant, and you alledge no other) every one that will learn Geometry, must gather the Definition from observing how the word to be defined is most constantly used in common speech. But in common speech if a man -hall ask how much (for example) is six in respect of four, and one man answer that it is greater by two, and another that it is greater by half of four, or by a third of six, he that asked the question, will be satisfied by one of them, though perhaps by one of them now, and by the other another time, as being the onely man that knoweth why he himself did ask the Question. But if a man should answer, as you would do, that the Proportion of six to two is of th-se numbers, a certain Quotient, he would receive but little satisfaction. Between the said answers to this Question, How much is six in respect of four? there is this difference. He that answereth that it is more by two, compareth not two with four, nor with six, for two is the name of a Quantity absolute. But he that answereth it is more by half of four, or by a third of six, compareth the difference with one of the differing Quantities. For halves, and thirds, &c, are names of Quantity compared.

From hence there ariseth two Species or kinds of (Ratio) Proportion, into which the generall word Proportion may be divided. The one whereof (namely, that wherein the Difference is not compared with either of the differing Quantities) is called (Ratio Arithmetica) Arithmetically Proportion; the other (Ratio Geometrica) Geometrically Proportion, and (because this latter is onely taken notice of by the name of Proportion) simply Proportion. Having considered this, I defined Proportion, Cha. Arti. 3. in this manner, *Ratio est Relatio Antecedentis ad Consequens secundum magnitudinem*. Proportion is the Relation of the Antecedent to the Consequent in Magnitude; having immediately before defined Relatives, Antecedent, and Consequent- in the same Article, and by way of explication added, that such Relation was nothing else but that one of the Quantities was equall to the other, or exceeded it by some Quantity, or was by some Quantity exceeded by it. And for exemplification of the same, I added further, that the Proportion of three to two, was that three exceeded two by a unity; but said not that the unity, or the difference whatsoever it were, was their proportion, for Unity, and to exceed another by Unity, is not the same thing. This is cleer enough to others. Let us therefore see why it is not so to you. You say I make Proportion to consist in that which remaineth after the lesser Quantity is subtracted out of the greater; and that you make it to consist in the Quotient, when one number is divided by the other. Wherein you are mistaken; first, in that you say I make the Proportion to consist in the Remainder. For I make it to consist in the act of exceeding, or of being exceeded, or of being equall; whereas the Remainder is alwayes an absolute Quantity, and never a Proportion. To be more or less then another number by two, is not the number two; Likewise to be equall to two, where the difference is nothing, is not that nothing? Again, you mistake in saying the Proportion consisteth in the Quotient. For divide twenty by five, the Quotient is four. Is it not absurd to say that the Proportion of five to twenty,

or of twenty to five, is four? You may say the Proportion of five to twenty, is the Proportion of one to four. And so say I. And you may therefore also say, that the Proportion of one to four is a measure of the Proportion of five to twenty, as being Equall. And so say I. But that is onely in Geometricall Proportion, and not in Proportion universally. For though the Species obtain the Denomination of the Genus; yet it is not the Genus. But as the Quotient giveth us a measure of the Proportion of the Dividend to the Divisor in Geometricall Proportion, so also the Remainder after Substraction is the measure of Proportion Arithmetically.

You object in the next place, That if the Proportion of one Quantity to another be nothing but the excess or defect, then, wheresoever the Excess or Defect is the same, there the Proportion is the same. This you say follows in your Logick, and from thence, that the Proportion of three to two, and five to four is the same. But is not three to two, and five to four, where the Excess is the same number, the same Proportion Arithmetically? And is not Arithmetically Proportion, Proportion? You take here (Ratio) Proportion (which is the Genus) for that Species of it, which is called Geometrically, because usually this Species has the name of Proportion simply. Also that the Proportion of three to two, is the same with that of nine to six; Is it not because the excesses are one and three, the same portions of three and nine, that is to say, the same excesses comparatively? I wonder you ask me not what is the Genus of Arithmetically, and Geometrically Proportions; and what the Difference. The Genus is (Ratio) Proportion, or Comparison in Magnitude, and the Difference is that one Comparison is made by the absolute Quantity, the other by the Comparative Quantity, of the Excess or Defect, if there be any. Can any thing be clearer then this? You after come in with Ignosce hebitudini to no purpose. I am not so inhumane as not to pardon dulness, or madness; They are not voluntary faults. But when men

adventure voluntarily, to talk of that they understand not censoriously and scornfully, I may tell them of it.

This difference between the Excesses or Defects, as they are simply or comparatively reckoned, being thus explained, all the rest of that you say in your objections to this eleventh Chapter (saving that Artt. 5. for Ratio binarii ad quinarium est superar- Ternario, as it is in other places, I have put too hastily Ratio binarii ad quinarium est Ternarius) will be understood by every Reader to be frivolous, and to proceed from the ignorance of what Proportion is.

At the twelfth Chapter you onely note that I say, That the Proportion of Inequality is Quantity, but the Proportion of Equality not Quantity, and refer that which you have to say against it to the Chapter following; to which place, I shall also come in the following Lesson.

**OF THE FAULTS THAT OCCURRE IN DEMONSTRATION.
TO THE SAME EGREGIOUS PROFESSORS OF THE
MATHEMATICKS IN THE UNIVERSITY OF OXFORD.
LESSON III.**

YOU BEGIN YOUR reprehension of my thirteenth Chapter with a Question. Whereas I divide Proportion into Arithmetically, and Geometrically; You ask me what proportion it is I so divide. Euclide divides an Angle into Right, Obtuse, and Acute. I may ask you as pertinently what Angle it is he so divides? Or when you divide Animal into Homo, and Brutum, what Animal that is which you so divide? You see by this how absurd your Question is. But you say the Definition of Proportion which I make at Cha. Art. 3. namely, that Proportion is the comparison of two Magnitudes, one to another, agreeeth not, neither with Arithmetically, nor with Geometrically Proportion. I believe you thought so then, but having read what I have said in the end of the last Lesson, if you think so still, your fault will be too great, to be pardoned easily. But why did you think so before? Is it not because there was no Definition in Euclide of Proportion universally, and because he maketh no mention of Proportion Arithmetically, and because you had not in your minds a sufficient notion thereof yourselves to supply that Defect? And is not this the cause also, why you put in this Parenthesis (if Arithmetically Proportion, ought to be called Proportion)? which is a confession that you know not whether there be such a thing as Arithmetically Proportion or not; notwithstanding, that on all occasions, you speak of Arithmetically Proportionals. Yes, this was it that made you think that Proportion universally, and Proportion Geometrically is the same and yet to

say you cannot tell whether they be the same or not. 'Tis no wonder therefore, if in such confusion of the understanding, you apprehend not that the Proportions of two to five, and nine to twelve, are the same; for you are blinded by seeing that they are not the same Proportions Geometricall. Nor doth it help you that I say the Difference is the Proportion, f — by Difference you might if you would, have understood the act of Differing.

At the second Article you note for a fault in Method, that after I had used the words Ant-ecedent and Consequent of a Proportion in some of the precedent Chapters, I define them afterwards.. I do not believe you say this against your knowledge, but that the eagerness of your malice made you oversee. Therefore go back again to the third A-ticle of Cha. Where having defined Correlatives, I add these words, Of which the first is called the Antecedent, the second the Consequent. This is but an oversight, though such as in me, you would not have excused.

At the thirteenth Article you find fault with, that I say that the Proportion of Inequality, whether it be of Excess, or of Defect, is Quantity, but the Proportion of Equality is not Quanty. Whether that which you say, or that which I say be the truth, is a Question worthy of a very strict Examination. The first time I heard it argued, was in Mersennus his Chamber at Paris, at such time, as the first volume of his Cogitata Physico-Mathematica was almost printed: In which, because he had not said all he would say of Proportion, he was forced to put the rest into a Generall Preface; which as was his custom, he did read to his Friends, before he sent it to the Pr-ss. In that generall Preface under the Title de Rationibus at{que} Proportionibus, at the Numbers twelve, thirteen, fourteen, he maintaineth against Clavius, that the Composition of Proportions is (as of all other things) a Composition of the Parts to make a Totall; and that the proportion of equality answereth in Quantity, to non-ens, or Nothing; the proportion of excess, to ens, or Quantity; and the Proportion of Defect, to less then Nothing; because

Equality (he saies) is a term of middle signification, between Ex-ess and Defect. And there also he refuteth the Arguments which Clavius at the end of the ninth Element of Euclide bringeth to the contrary. And though this were approved by divers good Geometricians then present, and never gain-sayed by any since, Yet do not I say it upon the credit of them, but upon sufficient grounds. For it hath been demonstrated by Euto-ius that if there be three magnitudes, the proportion of the first to the third is compounded of the proportions of the first to the second, and of the second to the third; Which also I demonstrate in this Article. And if there were never so many magnitudes ranked, it might be likewise demonstrated, that the Proportion of the first to the last is compounded of the Proportions of the first to the second, and of the second to the third, and of the third to the fourth, and so on to the last. If therefore we put in order any three numbers, whereof the two last be equall, as four, seven, seven, the Proportion of four the first, to seven the last, will be compounded of the Proportions of four the first, to seven the second, and of seven the second, to seven the third. Wherefore the Proportion of seven to seven (which is of equality) addeth nothing to the Proportion of four the first, to seven the second; and consequently the Proportion of seven to seven hath no Quantity. But that the Proportion of Inequality hath Quantity, I prove it fro- this, that one Inequality may be greater then another.

But for the clearing of this Doctrine (which Mersennus calls Intricate) of the composition of Proportions, I observed, first, that any two Quantities, being exposed to sense, their Proportion was also exposed; which is not Intricate. Again, I observed that if besides the two exposed Quantities, there were exposed a third, so as the first were the least, and the third the greatest, or the first the greatest, and the third the least, that not onely the Proportions of the first to the second, but also (because the Differences, and the Quantities proceed the same way) the Proportion of the first to the last is

exposed by composition, or addition of the Differences; nor is there any intricacy in this. But when the first is less then the second, and the second greater then the third, or the first greater then the second, and the second less then the third, so that to make the first and second equall, if we use addition, we must to make the second and third equall use subtraction, then comes in the intricacy, which cannot be extricated, but by such as know the truth of this Doctrine which I now delivered out of Mersennus: namely, That the Proportions of Excess, Equality, and Defect, are as Quantity, not-Quantity, nothing want Quantity, or as Symbo lists mark them . 0. 0-1 And upon this ground I thought depended the universall truth of this Proposition, that in any rank of Magnitudes of the same kind, the Proportion of the first to the last, was compounded of all the Proportions (in order) of the intermediate Quantities; the want of the proof thereof Sir Henry S-vile-als (Naevus) a mole in the Body of Geometry. This Proposition is demonstrated at the thirteenth Article of this Chapter.

But before we come thither, I must examine the Arguments you bring to confute this Proposition, that the Proportion of Inequality is Quantity, of Equality not Quantity.

And first, you object that Equality and Inequality are in the same Predicament. A pretty Argument to flesh a young Scholar in the Logick School, that but now begins to learn the Predicaments. But what do you mean by Aequale, and Inequale? Do you mean Corpus Aequale, and Corpus Inequale? They are both in the Predicament of Substance, neither of them in that of Quantity; Or do you mean Aequalitas, and Inaequalitas? They are both in the Predicament of Relation, neither of them in that of Quantity, and yet both Corpus, and Inaequalitas, though neither of them be Quantity, may be Quanta, that is, both of them have Quantity, And when men say Body is Quantity, or Inequality is Quantity, they are no otherwise understood, then if they had said Corpus est tantum, and Inaequalitas tanta, not Tantitas; that is,

Bodies and Inequalities are so much, not somuchness; and all intelligent men are contented with that expression, and your selves use it. And the Quantity of Inequality is in the Predicament of Quantity, because the measure of it is in that Line by which one Quantity exceeds the other. But when neither exceedeth other, then there is no Line of Excess, or Defect by which the Equality can be measured, or said to be so much, or be called Quantity. Philosophy teacheth us how to range our words; but Aristotles ranging them in his Predicaments, doth not teach Philosophy; And therefore no Argument taken from thence, can become a Doctor, and a Professor of Geometry.

To prove that the Proportion of Inequality was Quantity, but the Proportion of Equality, not Quantity, my Argument was this; That because one Inequality may be greater or less then another, but one Equality cannot be greater nor less then another, Therefore Inequality hath Quantity, or is Tanta, and Equality not. Here you come in again with your Predicaments, and object, that to be susceptible of magis and minus belongs not to quantity, but to Quality; but without any proof, as if you took it for an Axiome. But whether true or false, you understand not in what sense it is true or false. 'Tis true, that one Inequality is Inequality, as well as another; as one heat is heat as well as another; but not as great; Tam, but not Tantus. But so it is also in the Predicament of Quantity; one Line is as well a Line as another, but not so great. All degrees, intensions, and remissions of Quality, are greater or less Quantity of force, and measured by Lines, Superficies, or Solid Quantity, which are properly in the Predicament of Quantity. You see how wise a thing it is to argue from the Predicaments of Aristotle, which you understand not. And yet you pretend to be less addicted to the authority of Aristotle, now, then heretofore.

In the next place you say, I may as well conclude from the not susception of greater and less, that a Right Angle is not Quantity, but an Oblique one

is. Very learnedly. As if to be greater or less could be attributed to a Quantity once determined. Number (that is number indefinitely taken) is susceptible of greater and less, because one number may be greater than another. And this is a good Argument to prove that Number is Quantity. And do you think the Argument the worse for this, that one six cannot be greater than another six? After all these childish Arguments which you have hitherto urged, can you perswade any man, or your selves, that you are Logicians?

To the fifth and sixth Article you object, first, that if I had before sufficiently Defined (Ratio). Proportion, I needed not again define what is (eadem Ratio) the same-Proportion; and ask me whether when I have defined man, I use to define anew what is the same man? You think when you have the Definition of Homo, you have also the Definition of idem Homo, when 'tis harder to conceive what idem signifies, then what Homo. Besides, idem hath not the same signification alwayes, and with whatsoever it be joyned; it doth not signifie the same with Homo, that it doth with Ratio. For with Homo, it signifies the same individual man, but with Ratio it signifies a like, or an equall Proportion. And both (Ratio) Proportion, and (idem) the same, being defined, there will still be need of another Definition for (eadem Ratio) the same Proportion. And this is enough to defend both my self and Euclide, against this objection. For Euclide also after he had Defined (Ratio Proportion, and that sufficiently as he believed, yet he defines the same Proportion again apart. I know you did not mean in this place to object any thing against Euclide; but you saw not what you were doing. There is within you some speciall cause of Intenebration, which you should do well to look to.

In the next place you say, when I had defined Arithmetically Proportions to be the same when the difference is the same; it was to be expected I should define Geometricall Proportions to be then the same,

when the Antecedents are of their Consequents Totuple, or Tantuple, that is, equimultiple (for Tantuplum signifies nothing.) In plain words, you expected, that as I defined one by subtraction, I should define the other by the Quotient in Division. But why should you expect a Definition of the same Proportion by the Quotient? Neither Reason nor the Authority of Euclide could move you to expect it. Or why should you say it was to be expected? But it seems you have the vanity to place the measure of truth in your own Learning. In Lines incommensurable there may be the same Proportion, when nevertheless there is no Quotient; for setting their Symboles one above another doth not make a Quotient; for Quotient there is none, but in aliquot parts. It is therefore impossible to define Proportion universally, by comparing Quotients. This incommensurability of Magnitudes was it that confounded Euclide in the framing of his Definition of Proportion at the fifth Element. For when he came to numbers, he defined the same Proportion irreprehensibly thus, Numbers are then Proportional, when the first of the second, and the third of the fourth are equimultiple, or the same part, or the same parts; and yet there is in this Definition no mention at all of a Quotient. For though it be true that if in dividing two Numbers you make the same Quotient, the Dividends and the Divisors are Proportionall, yet that is not the Definition of the same Proportion, but a Theoreme Demonstrable from it. But this Definition Euclide could not accommodate to Proportion in Generall, because of incommensurability.

To supply this want, I thought it necessary to seek out some way, whereby the Proportion of two Lines, Commensurable, or Incommensurable, might be continued perpetually the same. And this I found might be done by the Proportion of two Lines described by some uniform motion, as by an Efficient cause both of the said Lines, and also of their Proportions. Which motions continuing, the Proportions must needs be all the way the same. And therefore I defined those Magnitudes to have the

same Geometricall Proportion, when some cause producing in equall times, Equall Effects, -id determine both the Proportions. This you say needs an Oedipus to make it understood. You are (I see) no Oedipus; but I do not see any diff — ulty, neither in the Definition, nor in the Demonstration. That which you call perplexity in the Explication, is your prejudice, arising from the Symboles in your fancy. For men that pretend no less to naturall Phylosophy, then to Geometry, to find fault with bringing Motion and Time into a Definition, when there is no effect in nature, which is not produced in Time by Motion, is a shame. But you swim upon other mens bladders in the Superficies of Geometry, without being able to indure diving. Which is no fault of mine; and therefore I shall (without your leave) be bold to say, I am the first that hath made the grounds of Geometry firm and coherent. Whether I have added any thing to the Edifice or not, I leave to be judged by the Readers. You see, you that profess with the pricking of bladders the letting out of their vapour, how much you are deceived. You make them swell more then ever.

For the Corollaries that follow this sixth Article, you say they contain nothing new. Which is not true. For the nineth is new, and the Demonstrations of all the rest are new, being grounded upon a new Definition of Proportion, and the Corollaries themselves for want of a good Definition of Proportion, were never before exactly Demonstrated. For the truth of the sixth Definition of the fifth Elem-...t of Euclide cannot be known but by this Definition of mine, because it requires a Triall in all numbers possible, that is to say, an infinite time of Triall, whether the quimultiples of the first and third, and of the second and fourth in all multiplications do together exceed, together come short, and are together equall; which Triall is impossible.

In objecting against the thirteenth and sixteenth Article, I observe that you bewray together, both the greatest Ignorance, and the greatest malice;

and 'tis well, for they are sutable to one another, and fit for one and the same man. In the thirteenth Article my Proposition is this, If there be three Magnitudes that have Proportion one to another, the Proportions of the first to the second, and of the second to the third taken together (as one Proposition) are equall to the Proportion of the first to the third. This Demonstrated, there is taken away one of those Moles which Sir Henry Savile complaineth of in the Body of Geometry. Let us see now what you say both against the Enunciation, and against the Demonstration.

Against the Enunciation you object, that other men wo-ld say (not the Proportions of the first to the second, and of the second to the third, taken together, &c. but) the Proportion which is compounded of the Proportion of the first to the second, and of the second to the third, &c. Is not the compounding of any two things whatsoever the finding of the sum of them both, or the taking of them together as one totall. This is that absurdity of which Mersennus in the generall Preface to his *Cogitata Physico-Mathematica* hath convinced Clavius, who at the end of Euclides ninth Element denyeth the composition of Proportion to be a Composition of Parts to make a Totall; Which therefore he denyed, because he did not observe, that the Addition of a Proportion of defect, to a Proportion of Excess, was a Substraction of Magnitude; and because he understood not that to say, Composition is not the making a whole of Parts, was contradiction; which all, but too learned men would as soon as they heard - bho-re. Therefore in saying that other men would not speak in that manner, you say in effect they would speak absurdly. You do well to mark what other Geometricians say; but you would do better if you could by your own Meditation, upon the things themselves, examine the truth of what they say. But you have no minde (you say) to contend about the Phrase. Let us therefore see what it is you contend about.

The Proportion (you say) which is compounded of double and triple Proportion, is not (as I would have it) Quintuple, but Sextuple, as in these numbers, six, three, one; where the Proportion of six to three is double, the Proportion of three to one triple, and the Proportion of six to one sextuple, not quintuple. Tell me (egregious Professors) how is six to three double Proportion? Is six to three the double of a number, or the double of some Proportion? All men know the number six is double to the number three, and the number three triple to an unity. But is the Question here of compounding numbers, or of compounding Proportions Euclide at the last Proposition of his ninth Element sayes indeed, that these numbers, one, two, four, eight, are in double Proportion, yet there is no man that understands it otherwise, then if he had said in Proportion of the single Quantity, to the double Quantity; and after the same Rate, if he had said three, nine, twenty-seven, &c. had been in triple Proportion, all men would have understood it, of the Proportion of any Quantity to its Triple. Your instance therefore of six, three, one, is here impertinent, there being in them no doubling, no tripling, nor sextupling of Proportions, but of numbers. You may observe also that Euclide never distinguisheth between double and duplicate, as you do. One word serves him every where for either. Though I confess some curious Grammarians take for duplicate in number, and for double in Quantity; which will not serve your turn. Your Geometry is not your own, but you case your selves with Euclides; in which, as I have shewed you, there be some few great holes; and you by misunderstanding him, as in this place, have made them greater, Though the beasts that think your railing, -oaring, have for a time admired you; yet now that through these holes of your case, I have shewed them your ears, they will be less affrighted. But to exemplifie the composition of Proportions, take these numbers, thirty-two, eight, one, and then you shall see that the Proportion of thirty-two to one is the sum of the Proportions of thirty-two to eight, and of

eight to one. For the Proportion of thirty-two to eight is double the Proportion of thirty-two to sixteen. And the Proportion of eight to one, is triple the Proportion of thirty-two to sixteen, and the Proportion of thirty-two to one is Quintuple of thirty-two to sixteen. But double and triple added together maketh quintuple. What can be here denied?

My Demonstration consisteth of three cases. The first is when both the Proportions are of defect, which is then, when the first Quantity is the least; as in these three Quantities, AB, AC, AD. The first case I demonstrated thus. Let it be supposed that the point A were moved uniformly through the whole line AD. The Proportions therefore of AB to AC, and of AC to AD, are determined by the difference of the Times in which they are described. And the Proportion also of AB to AD, is that which is determined by the difference of the Times, in which they are described; but the difference of the Times in which AB and AC are described, together with the difference of the Times, wherein AC and AD are described, is the same with the difference of the Times, wherein are described AB and AD. The same cause therefore which determines both the Proportions of AB to AC, and of AC to AD, determines also the Proportion of AB to AD. Wherefore by the Definition of the same Proportion, Article six, the Proportion of AB to AC, together with the Proportion of AC to AD is the same with the Proportion of AB to AD.

Consider now your argumentation against it. Let there be taken (say you) between A and B the Point a, and then in your own words, I argue thus. The difference of the Times wherein are described AB and AC, together with the difference of the Times, wherein are described AC and AD, is the same with the difference of the Times, in which are described aB and aC (namely BD, or BC + CD) wherefore the same cause which determines the two Proportions of AB to AC, and of AC to AD, determines also the Proportion of aB to aD. Let me ask you here whether you suppose the Motion from a to

B, or from a to D, to have the same swiftness with the motion from A to B, or from A to D. If you do not, then you deny the supposition. If you do, then BC which is the difference of the Times AB and AC, cannot be the difference of the Times in which are described aB and aC, except AB and aB are equall. Let any man judge now whether there be any Paralogism in Orontius that can equall this. And whether all that follows in the rest of this, and the next two whole Pages, be not all a kind of raving upon the ignorance of what is the meaning of Proportion, which you also make more ill-favoured by writing it; not in language, but in Gamboles, I mean in the Symboles, which have made you call those demonstrations short, which put into words so many as a true demonstration requires, would be longer then any of those of Clavius upon the twelfth Element of Euclide.

To the sixteenth Article you bring no Argument, but fall into a loud Oncethmus (the special Figure wherewith you grace you Oratory) offended with my unexpected crossing of the Doctrine you teach, that Proportion consisteth it a Quotient. For that being denyed you, your comes to nothing, that is, to just as much as it is worth But are not you very simple men, to say that all Mathematicians speak so, when it is not speaking? When did you see any man but your selves publish his Demonstrations by signs not generally received, except it were not with intention to demonstrate, but to t — ch the use of Signes? Had Pappus no Analytiques? Or wanted he the wit to -...ten his reckoning by Signes? Or has he not proceeded Analytically in an hundred Problems (especially in his seventh Book) and never used Symboles? Symboles are poor unhandsome (though necessary) sc-ffolds of Demonstration; and ought no more to appear in publique, then the most d — rmed necessary business which you do in your Chambers. But why (say you) is this -...tion to the Proportion of the greater to the less? Ile tell you; because i-erating of the Proportion of the less to the greater, is a making of the Proportion less, and the defect greater. And it is absurd to say that the

taking of the same Quantity twice should make it less. And thence it is, that in Quantities, which begin with the less, as one, two, four, the Proportion of one to two, is greater then that of one to four, as is Demonstrated by Euclide Elem. 5. Pro. and by consequent the Proportion of one to four, is a Proportion of greater littleness then that of one to two. And who is there, that when he knoweth that the respective greatness of four to one, is double to that of the respective greatness of four to two, or of two to one, will not presently acknowledge that the respective greatness of one to two, or two to four is double to the respective greatness of one to four. But this was too deep for such men as take their opinions not from weighing, but from reading.

Lastly, you object against the Corollarie of Art. 28. (which you make absurd enough by rehearsing it thus) *si quantitas aliqua divisa supponatur in partes aliquot aequales numero infinitas. &c.* Do you think that of *partes aliquot*, or of *partes aliquotae*, it can be said without absurdity, that they are *numero infinitae*? And then you say I seem to mean, that if of the Quantity AB, there be supposed a part CB, infinitely little, and that between AC and AB be taken two means, one Arithmetically AE, the other Geometrically AD, the difference between AD, and AE, will be infinitely little. My meaning is, and is sufficiently expressed, that the said means taken every where (not in one place onely) will be the same throughout. And you that say there needed not so much pains to prove it, and think you do it shorter, prove it not at all. For why may not I pretend against your demonstration, that BE the Arithmetically difference, is greater then BD the Geometrically difference. You bring nothing to prove it, and if you suppose it, you suppose the thing you are to prove. Hitherto you have proceeded in such manner with your Elenchus, as that so many objections as you have made, so many false Propositions you have advanced. Which is a peculiar excellence of yours,

that for so great a stipend as you receive, you will give place to no man living for the number and grossness of errors you teach your Scholars.

At the fourteenth Chapter your first exception is to the second Article; where I define a plain in this manner. A plain Superficies is that which is described by a straight Line so moved, as that every Point thereof describe a severall straight L-.... In which you require, first, that instead of describe, I should have said can describe. Why do you not require of Euclide in the Definition of a Cone, instead of (Continetur) is contained, he say (containeri potest) can be contained? It I tell you how one Plain is generated, cannot you apply the same generation to any other Plain? But you object that the Plain of a Circle may be generated by the motion of the Radius, whose every point describeth not a straight but a crooked Line, wherein you are deceived; for you cannot draw a Circle (though you can draw the perimeter of a Circle) but in a Plain already generated. For the motion of a straight Line, whose one Point resting, describeth with the other Points severall perimeters of Circles, may as well describe a Conique Superficies, as a Plain. The Question therefore is, how you will in your Definition take in the Plain which must be generated before you begin to describe your Circle, and before you know what Point to make your Center. This objection therefore is to no purpose; and besides, that it reflecteth upon the perfect definitions of Euclide before the eleventh Element; it cannot make good his Definition (which is nothing worth) of a Plain Superficies, before his first Element.

In the next place you reprehend briefly this Corollarie, that two Plaines cannot inclose a Solid. I should indeed have added, with the base on whose extreame they insist. But this is not a fault to be ashamed of. For any man by his own understanding might have mended my expression without departing from my meaning. But from your Doctrine that a Superficies has no thickness, 'tis impossible to include a Solid, with any Number of Plains

whatsoever; unless you say that Solid is included which nothing at all includes.

At the third Article, where I say of crooked lines, some are every where crooked, and some have parts not crooked. You ask me what crooked Line has parts not crooked; and I answer, it is that Line which with a straight Line makes a rectilineall Triangle. But this you say cannot stand with what I said before, namely, that a straight and crooked line cannot be coincident; which is true, nor is there any contradiction; for that part of a crooked line which is straight, may with a straight line be coincident.

To the fourth Article, where I define the Center of a Circle to be that Point of the Radius, which in the description of the Circle is unmoved; You object as a contradiction, that I had before defined a Point to be the body which is moved in the description of a Line. Foolishly, As I have already shown at your objection to Cha. Art. 12.

But at the sixth Article, where I say that crooked, and incongruous Lines touch one another but in one Point, you make a cavill from this, that a Circle may touch a Parabola in two Points. Tell me truely, did you read and understand these words that followed, a crooked Line cannot be congruent with a straight line, because if it could, one and the same line should be both straight and crooked? If you did, you could not but understand the sense of my words to be this; when two crooked lines which are incongruous, or a crooked and a straight line touch one another, the contact is not in a Line, but only in one Point; and then your instance of a Circle and a Parabola, was a wilfull cavill, not befitting a Doctor. If you either read them not, or unstood them not, it is your own fault. In the rest that followeth upon this Article, with your Diagram, there is nothing against me, nor any thing of use, novelty, subtilty or learning.

At the seventh Article, where I define both an Angle, simply so called, and an Angle of Contingence, by their severall generations, namely, that the

former is generated when two straight Lines are coincident, and one of them is moved, and distracted from the other by circular motion upon one common Point resting, &c. You ask me to which of these kinds of Angle, I ref-r the Angle made by a straight Line when it cuts a crooked Line. I answer easily and truly, to that kind of Angle which is called simply an Angle. This you understand not. For how (will you say) can that Angle which is generated by the divergence of two straight Lines, be other then Rectilineall? O, how can that Angle which is not comprehended by two straight Lines, be other then Curvilineall? I see what it is that troubles you, namely, the same which made you say before, that if the Body which describes a Line be a Point, then there is nothing which is not moved that can be called a Point. So you say here, If an Angle be generated by the motion of a straight Line, then no Angle so generated can be Curvilineall. Which is as well argued, as if a man should say, the House was built by the carriage and motion of Stone and Timber, therefore when the carriage and that motion is ended, it is no more a house. Rectilineall and Curvilineall hath nothing to do with the nature of an Angle simply so called, though it be essentiall to an Angle of Contact. The measure of an Angle simply so called is a circumference of a Circle, and the measure is alwayes the same kind of Quantity with the thing measured. The Rectitude or Curvity of the Lines which drawn from the Center intercept the Arch, is accidentary to the Angle, which is the same, whether it be drawn by the motion circular of a streight line or of a crooked. The Diameter and the Circumference of a Circle make a right Angle, and the same which is made by the Diameter and the Tangent. And because the point of Contact is not (as you think) nothing, but a line unreckoned, and common both to the Tangent, and the Circumference, the same Angle computed in the Tangent is Rectilineall, but computed in the Circumference, not Rectilineall, but mixt; or, if two Circles cut one another, Curvilineall. For every Chord maketh the same Angle with

the Circumference which it maketh with the line that toucheth the Circumference at the end of the Chord. And therefore when I divide an Angle simply so called into Rectilineall, and Curvilineall, I respect no more the generation of it, then when I divide it into Right and Oblique. I then respect the generation, when I divide an Angle into an Angle simply so called, and an Angle of Contact. This that I have now said, if the Reader remember when he reads your objections to this, and to the ninth Article, he will need no more to make him see that you are utterly ignorant of the nature of an Angle, and that if ignorance be madness, not I, but you are mad; and when an Angle is comprehended between a straight and a crooked Line (if I may compute the same Angle as comprehended between the same straight Line and the Point of Contact) that it is consonant to my definition of a Point by a Magnitude not considered. But when you in your treatise de Angulo Contactûs Cha. Pag. 6. Lin. 8. have these words, Though the whole concurrent Lines incline to one another, yet they form no Angle any where but in the very point of concourse, You, that deny a Point to be any thing, tell me how two nothings can form an Angle; or if the Angle be not formed neither before the concurrent Lines meet, not in the Point of concourse, how can you apprehend that any Angle can possibly be framed. But I wonder not at this absurdity, because this whole treatise of yours is but one absurdity continued from the beginning to the end; as shall then appear when I come to answer your objections to that which I have briefly and fully said of that Subject in my 14. Chapter.

At the twelfth Article I confess your exception to my universall definition of Parallels to be just, though insolently set down. For it is no fault of ignorance (though it also infect the demonstration next it) but of too much security. The Definition is this: Parallels are those Lines or Superficies, upon which two straight Lines falling, and wheresoever they fall, making equall Angles with them both, are equall; which is not, as it

stands, universally true. But inserting these words the same way, and making it stand thus, Parallel Lines or Superficies are those, upon which two straight Lines falling the same way, and wheresoever they fall, making equall Angles, are equall, it is both true and universall; and the following Consectary with very little change, as you may see in the translation, perspicuously demonstrated. The same fault occurreth once or twice more; and you triumph unreasonably, as if you had given therein a very great proof of your Geometry.

The same was observed also upon this place by one of the prime Geometricians of Paris, and noted in a Letter to his friend in these words, Cha. Art. 12. the Definition of Parallels wanteth somewhat to be supplied. And of the Consectary, he says, it concludeth not, because it is grounded on the Definition of Parallels. Truly, and severely enough, though without any such words as savour of Arrogance, or of Malice, or of the Clown.

At the thirteenth Article you recite the Demonstration by which I prove the Perimeters of two Circles to be Proportionall to their Semidiameters; and with Esto, fortasse, recte, omnino, noddying to the severall parts thereof, you come at Length to my last inference; Therefore by (Cha. Art. 6.) the Perimeters and Semidiameters of Circles are Proportionall; which you deny; and therefore deny, because you say it followeth by the same Ratiocination, that Circles also and Spheres are Proportionall to their Semidiameters. For the same distance (you say) of the Perimeter from the Center which determines the magnitude of the Semidiameter, determines also the magnitude both of the Circle, and of the Sphere. You acknowledge that Perimeters and Semidiameters have the cause of their determination such as in equal times make equall spaces. Suppose now a Sphere generated by the Semidiameters, whilst the Semicircle is turned about. There is but one Radius of an infinite number of Radii, which describes a great Circle, all the rest describe lesser Circles Parallel to it, in one and the same time of

Revolution. Would you have men believe, that describing greater and lesser Circles, is according to the supposition (*temporibus aequalibus aequalia facere*) to make equall spaces in equall times? Or when by the turning about of the Semidiameter is described the Plain of a Circle does it (think you) in equall times make the Plains of the interior Circles equall to the plains of the exterior? Or is the Radius that describes the inner Circles equall to the Radius that describes the exterior? It does not therefore follow from any thing I have said in this demonstration, that either Spheres, or Plains of Circles, are Proportionall to their Radii. And consequently all that you have said, triumphing in your own Incapacity, is said imprudently by your selves to your own disgrace. They that have applauded you, have reason by this time to doubt of all the rest that follows, and if they can, to dissemble the opinion they had before of your Geometry. But they shall see before I have done, that not only your whole Elenchus, but also your other Books of the Angle of Contact, &c. are meer ignorance and gibberish.

To the fourteenth Article you object, that (in the sixth figure) I assume gratis, that FG, DE, BC, are Proportionall to AF, AD, AB; and you referre it to be judged by the Reader. And to the Reader I referre it also. The not exact drawing of the Figure (which is now amended) is it that deceived you. For AF, FD, DB, are equall by construction. Also AG, GE, EC, are equall by construction. And FG, DK, BH, KE, HI, IC, are equall by Parallelism. And because AF, FG, are as the velocities wherewith they are described; also 2 AF (that is AD) and 2 FG (that is DE) are as the same velocities. And finally 3 AF (that is AB) and 3 FG (that is BC) are as the same velocities. It is not therefore assumed gratis, that FG, DE, BC, are Proportionall to AF, AD, AB, but grounded upon the sixth Article of the thirteenth Chapter; and consequently your objection is nothing worth. You might better have excepted to the placing of DE, first at adventure, and then making AD, two thirds of AB; for that was a fault, though not great enough to trouble a

Candid Reader; yet great enough, to be a ground, to a malicious Reader, of a Cavill.

That which you object to the third Corollarie of Art. 15. was certainly a dream. There is no a-...ing of an Angle CDE, for an Angle HDE, or BDE, neither in the Demonstration, nor in any of the Corollaries. It may be you dream't of somewhat in the twentieth Article of Cha. But because that Article though once printed, was afterwards left out, as not serving to the use I had designed it for, I cannot guess what it is. For I have no Copy of that Article, neither printed nor written, but am very sure, though it were not usefull, it was true.

Article the sixteenth. Here we come to the Controversie concerning the Angle of Contact, which (you say) you have handled, in a speciall Treatise published; and that you have clearly demonstrated in your publick Lectures, that Peletarius was in the right. But that I agree not sufficiently neither with Peletarius, nor with Clavius. I confess I agree not in all points with Peletarius, nor in all points with Clavius. It does not thence follow that I agree not with the Truth. I am not (as you) of any faction, neither in Geometry, nor in Politicks. If I think that you, or Peletarius, or Clavius, or Euclide have e-red, or been too obscure; I see no cause, for which I ought to dissemble it. And in this same Question, I am of opinion that Peletarius did not well in denying the Angle of Contingence to be an Angle. And that Clavius did not well to say the Angle of a Semicircle was less then a Right-lined Right Angle. And that Euclide did not well to leave it so obscure what he meant by Inclination in the Definition of a Plain Angle, seeing else where he attributeth Inclination onely to Acute Angles, and scarce any man ever acknowledged Inclination in a straight Line, to any other Line, to which it was perpendicular. But you in this Question of what is Inclination, though you pretend not to depart from Euclide, are nevertheless more obscure then he; and also are contrary to him. For Euclide by Inclination

meaneth the Inclination of one Line to another; and you understand it of the Inclination of one Line from another, which is not Inclination, but Declination. For you make two straight. Lines when they lye one on another, to lye that is without any Inclination (because it serves your turn); not observing that it followeth thence that Inclination is a digression of one Line from another. This is in your first Argument in the behalf of Peletarius (Pag. 10. Lin. 22.) and destroyshis opinion. For according to Euclide the greatest Angle is the greatest Inclination, and an Angle equall to two Right Angles by this should not be the greatest Inclination, as it is, but the least that can be. But if by the Inclination of two Lines we understand that proceeding of them to a common Point which is caused by their generation, which (I believ-) was Euclides meaning; then will the Angle of Contact be no less an Angle then a rectilineall Angle, but onely (as Clavius truly saies it is) Heterogeneous to it; and the doctrine of Clavius more conformable to Euclide then that of Peletarius. Besides, if it be granted you, that there is no inclination of the Circumference to the Tangent, yet it does not follow that their concourse doth not form some kind of Angle. For Euclide defineth there but one of the kinds of a Plain Angle. And then you may as much in vain seek for the Proportion of such an Angle to the Angle of Contact, as seek for the Focus, or Parameter of the Parabola of Dives and Lazarus. Your first argument therefore is nothing worth, except you make good that which in your second Argument you affirm, namely, That all Plain Angles, not excepting the Angle of Contact, are (Homogeneous) of the same kind. You prove it well enough of other Curvilineall Angles; but when you should prove the same of an Angle of Contact, you have nothing to say but Pag. 17. Lin. 15. Unde autem illa quam somniet Heterogenia oriatur, neque potest ille ullatenus ostendere, neque ego vel somniare; whence should arise that diversity of kind, which he dreams of, neither can be at all shew, nor I dream; as if you knew what he could do if he were to answer you; or all

were false which you cannot dream of. So that besides your customary vanity, here is nothing hitherto proved neither for the opinion of Peletarius, nor against that of Clavius. I have I think sufficiently explicated in the first Lesson, That the Angle of Contact is Quantity, namely, that it is the Quantity of that crookedness or flexion, by which a straight Line is bent into an Arch of a Circle equall to it; and that because the crookedness of one Arch may be greater then the crookedness of another Arch of another Circle equall to it, therefore the Question *Quanta est curvitas*, How much is the crookedness, is pertinent, and to be answered by Quantity. And I have also shewn you in the same Lesson, that the Quantity of one Angle of Contact is compared with that of another Angle of Contact, by a Line drawn from the Point of Contact, and intercepted by their Circumferences; and that it cannot be compared by any measure with a Rectilineall Angle.

But let us see how you answer to that which Clavius has objected already. They are Heterogeneous, sayes he, because the Angle of Contact, how oft soever multiplyed, can never exceed a Rectilineall Angle. To answer which you alleadge, it is no Angle at all; and that therefore it is no Angle at all because the Lines have no Inclination one to another. How can Lines that have no Inclination one to another, ever come together? But you answer, at least they have no Inclination in the Point of Contact. And why have two straight Lines Inclination before they come to touch, more then a straight Line and an Arch of a Circle? And in the Point of Contact it self, how can it be that there is less Inclination of the two Points of a straight Line and an Arch of a Circle, then of the Points of two straight Lines? But the straight Lines you say will cut; Which is nothing to the Question; and yet this also is not so evident, but that it may receive an objection. Suppose two Circles AGB and CFB to touch in B, and have a common Tangent through B. Is not the Line CFBGA a crooked Line? And is it not cut by the common Tangent DBE? What is the Quantity of the two Angles FBE and

GBD, seeing you say neither DBG nor EBF is an Angle? 'Tis not therefore the cutting of a crooked Line, and the touching of it, that distinguisheth an Angle simply, from an Angle of Contact. That which makes them differ, and in kind, is, that the one is the Quantity of a Revolution, and the other the Quantity of Flexion.

In the seventh Chapter of the same Treatise, you think you prove the Angle of Contact, if it be an Angle, and a Rectilineall Angle to be (Homogeneous) of the same kind; when you prove nothing but that you understand not what you say. Those Quantities which can be added together, or substracted one from another, are of the same kind; But an Angle of Contact may be substracted from a right Angle, and the Remainder will be the Angle of a Semicircle, &c. So you say, but prove it not, unless you think a man must grant you that the Superficies contained between the Tangent and the Arch, which is it you substract, is the Angle of Contact; and that the Plain of the Semicircle is the Angle of the Semicircle, which is absurd; though as absurd as it is, you say it directly in your Elenchus, Pag. 35. Lin. 14. in these words, When Euclide defines a Plain Angle to be the Inclination of two Lines, he meaneth not their aggregate, but that which lyes between them. It is true, he meaneth not the aggregate of the two Lines; but that he means that which lyes between them, which is nothing else but an indeterminate Superficies, is false, or Euclide was as foolish a Geometrician as either of you two.

Again, you would prove the Angle of Contact, if it be an Angle, to be of the same kind with a Rectilineall Angle, out of Eucl. 3. 16. Where he saies, it is less then any acute Angle. And it follows well, that if it be an Angle, and less then any Rectilineall Angle; it is also of the same kind with it. But to my understanding Euclide meant no more, but that it was neither greater nor equall; which is as truly said of Heterogeneous, as of Homogeneous Quantities. If he meant otherwise, he confirms the opinion of Clavius

against you, or makes the Quantity of an Angle to be a Superficies, and indefinite. But I wonder how you dare venter to determine whether two Quantities be Homogeneous or not, without some Definition of Homogeneous (which is a hard word) that men may understand what it meaneth.

In your eighth Chapter you have nothing but Sir H. Saviles Authority, who had not then resolved what to hold; but esteeming the Angle of contact, first, as others falsely did, by the Superficies that lyes between the Tangent and the Arch, makes the Angle of Contact, and a Rectilineall Angle Homogeneous; and afterwards, because no multiplication of the Angle of Contact can make it equall to the least Rectilineall Angle, with great ingenuity returneth to his former uncertainty.

In your ninth and tenth Chapters you prove with much ado, that the Angles of like Segments are equall; as if that might not have been taken gratis by Peletarius without Demonstration. And yet your Argument contained in the ninth Chapter is not a Demonstration, but a conjecturall discourse upon the word Similitude. And in the eleventh Chapter, wherein you answer to an objection, which might be made to your Argument in the precedent Page, taken from the Parallelism of two concentric Circles, though the objection be of no moment, yet you have in the same Treatise of yours that which is much more foolish, which is this, Pag. 38. Lin. 12. Non enim magnitudo Anguli, &c. The magnitude of an Angle is not to be estimated by that straddling of the legs, which it hath without the Point of concurrence, but by that straddling which it hath in the Point of the concurrence it self. I pray you tell me what straddling there is of two coincident Points, especially such Points as you say are nothing. When did you ever see two nothings straddle?

The Arguments in your twelfth and thirteenth Chapters are grounded all on this untruth, that an Angle is that which is contained between the Lines

that make it, that is to say, is a Plain Superficies. Which is manifestly false; because the measure of an Angle is an Arch of a Circle, that is to say, a Line; which is no measure of a Superficies. Besides this gross ignorance, your way of Demonstration by putting N for a great Number of sides of an aequilaterall Polygon, is not to be admitted. For though you understand something by it, you demonstrate nothing to any Body, but those who understand your Symbolique tongue, which is a very narrow Language. If you had demonstrated it in Irish, or Welsh, though I had not read it, ye- I should not have blamed you, because you had written to a considerable Number of mankind, which now you do not.

In your 1-st Chapters you defend Vitellio without need; for there is no doubt but that whatsoever crooked Line be touched by a straight Line, the Angle of Contingence will neither add any thing to, nor take any thing from a Rectilineall Right Angle; but that it is because the Angle of Contact is no Angle, or no Quantity, is not true. For it is therefore an Angle, because an Angle of Contact; and therefore Quantity, because one Angle of Contact may be greater then another; and therefore Heterogeneall, because the measure of an Angle of Contact cannot (congruere) be applyed to the measure of a Rectilineall Angle, as they think it may, who affirm with you that the Nature of an Angle consisteth in that which is contained between the Lines that comprehend it, viz. in a plain Superficies. And thus you see in how few Lines, and without B-achygraphie, your Treatise of the Angle of Contingence is discovered for the greatest part to be false, and for the rest, nothing but a detection of some errors of Clavius grounded on the same false Principles with your own. To return now from your Treatise of the Angle of Contact back again to your Elenchus.

The fault you find at Art. 18. is, that I understand not that Euclide makes a Plain Angle to be that which is contained between the two Lines that form it. 'Tis true, that I do not understand that Euclide was so absurd, as to think

the nature of an Angle to consist in Superficies; but I understand that you have not had the wit to understand Euclide.

The nineteenth Article of mine in this fourteenth Chapter is this; All respect, or variety of Position of two Lines, seemeth to be comprehended in four kinds. For they are either Parallel; or, (being if need be produced) make an Angle; or, (if drawn out faire enough) Touch; or lastly, they are Asymptotes. In which you are first offended with the word It seems. But I allow you that never erre, to be more peremptory then I am. For to me it seemed, I say again seemed, that such a Phrase, in case I should leave out something in the enumeration of the severall kinds of Position, would save me from being censured for untruth. And yet your instance of two straight Lines in divers Plains, does not make my enumeration insufficient. For those Lines though not Parallels, nor cutting both the Plaines, yet being moved Parallelly from one Plain to another, will fall into one or other of the kinds of position by me enumerated; and consequently are as much that position, as two straight Lines in the same Plain not parallel, make the same Angle, though not produced till they meet, which they would make if they were so produced. For you have no where proved, nor can prove, that two such Lines do not make an Angle. It is not the actuall concurrence of the Lines, but the Arch of a Circle, drawn upon that point for Center, in which they would meet, if they were produced, and intercepted between them, that constitutes the Angle.

Also your objection con-ernin- Asymptotes in generall, is absurd. You would have me add, that their distance shall at last be then any distance that can be assigned; and so make the definition of the Genus the same with that of the Species. But because you are not Professors of Logick, it is not necessary for me to follow your councill. In like manner, if we understand one Line to be moved towards another alwayes parallelly to its self, which

is, though not actually, yet potentially the same position, all the rest of your instances will come to nothing.

At the two and twentieth Article you object to me the use of the word Figure, before I had defined it: wherein also you do absurdly; for I have nowhere before made such use of the word Figure, as to argue any thing from it; and therefore your objection is just as wise as if you had found fault with putting the word Figure in the Titles of the Chapters placed before the Book. If you had known the nature of Demonstration, you had not objected this.

You add further, that by my Definition of Figure, a solid Sphere, and a Sphere made hollow within, is the same Figure; but you say not why, nor can you — derive any such thing from my definition. That which deceived your shallowness, is, that you take those Points that are in the concave Superficies of a hollowed Sphere, not to be contiguous to any thing without it, because that whole concave Superficies is within the whole Sphere. Lastly, for the fault you find, with the definition of like Figures in like positions; I confess there wants the same word which was wanting in the Definition of Parallels, namely, *ad eadem partes* (the same way) which should have been added in the end of the definition of like Figures, &c. and may easily be supplied by any student of Geometry, that is not otherwise a fool.

At the fifteenth Chapter Art. 1. Numb. 6. you object as a contradiction, that I make Motion to be the measure of Time, and yet in other places do usually measure Motion and the affections thereof by Time. If your thoughts were your own, and not taken rashly out of Books, you could not but (with all men else that see Time measured by Clocks, Dyals, Hour-glasses, and the like) have conceived sufficiently, that there cannot be of Time any other measure besides Motion; and that the most universall measure of Motion, is a Line described by some other Motion. Which Line

being once exposed to sense, and the motion whereby it was described sufficiently explicated, will serve to measure all other Motions and their Time; for Time and Motion (Time being but the mentall Image or remembrance of the motion) have but one and the same dimension, which is a Line. But you that would have me measure swiftnesse and slownesse by longer and shorter motion, what do you mean by longer and shorter motion? Is longer and shorter, in the motion, or in the Duration of the motion, which is Time? Or is the Motion, or the Duration of the motion that which is exposed, or designed by a Line? Geometricians say often, let the Line A B, be the Time; but never say, let the Line A B be the Motion. There is no unlearned man that understandeth not what is Time, and Motion, and Measure; and yet you that undertake to teach it (most egregious Professors) understand it not.

At the second Article you bring another Argument (which it seems in its proper place, you had forgotten) to prove that a Point is not Quantity not considered, but absolutely Nothing; which is this, That if a Point be not nothing, then the whole is greater then its two halves. How does that follow? Is it impossible when a Line is divided into two halves that the middle Point should be divided into two halves also, being Quantity?

At the seventh Article, I have sufficiently demonstrated, that all Motion is infinitely propagated, as far as space is filled with Body. You alleadge no fault in the demonstration, but object from sense, that the skipping of a Flea, is not propagated to the Indies. If I ask you how you know it, you may wonder perhaps; but answer you cannot. Are you Philosophers or Geometricians, or Logicians, more then are the simplest of rurall people? Or are you not rather less, by as much as he that standeth still in ignorance, is nearer to knowledge, then he that runneth from it by erroneous learning?

And lastly, what an absurd objection is it which you make to the eighth Article, where I say that when two Bodies of equall magnitude fall upon a

third Body, that which falls with greater velocity, imprints the greater motion? You object, that not so much the magnitude is to be considered as the weight; as if the weight made no difference in the velocity, when notwithstanding weight is nothing else but motion downward? Tell me, when a weighty body thrown upwards worketh on the Body it meeteth with, do you not then think it worketh the more for the greatness, and the less for the weight?

**OF THE FAULTS THAT OCCURRE IN DEMONSTRATION.
TO THE SAME EGREGIOUS PROFESSORS OF THE
MATHEMATICKS IN THE UNIVERSITY OF OXFORD.
LESSON III.**

OF TWENTY ARTICLES which you say (of nineteen which I say) make the six teenth Chapter; you except but three, and confidently affirm the rest are false. On the contrary, except three or four faults, such as any Geometrician may see proceed not from ignonorance of the Subject, or from want of the Art of Demonstration, (and such as any man might have mended of himself) but from security; I affirm that they are all true, and truly Demonstrated; and that all your objections proceed from meer ignorance of the Mathematiques.

The first fault you find is this, that I express not, (Art. 1.) what Impetus it is, which I would have to be multiplyed into the Time.

The last Article of my thirteenth Chapter was this, If there be a Number of Quantities propounded, howsoever equall or unequall to one another; and there be another Quantity which so often taken as there be Quantities propounded, is equall to their whole sum; that Quantity I call the mean Arithmetically of them all. Which Definition I did there insert to serve me in the explication of those Propositions of which the sixteenth Chapter consisteth, but did not use it here as I intended. My first Proposition therefore as it standeth yet in the Latine, being this, The velocity of any Body moved during any Time, is so much as is the product of the Impetus in one Point of Time, multiplyed into the whole Time; to a man that hath not skill enough to supply what is wanting, is not intelligible. Therefore I

have caused it in the English to go thus, The velocity of any Body in whatsoever Time moved, hath its Quantity determined by the sum of all the severall (Impetus) Quicknesses, which it hath in the severall Points of the Time of the Bodies motion, A-d ad-ed, that all the Impetus together taken through the whole Time is the same thing with the Mean Impetus (which Mean is defined Chapter 13. Art. 29.) multiplyed into the whole Time. To this first Article, as it is uncorrected in the Latine, you object, That meaning by Impetus some middle Impetus, and assigning none, I determine nothing. And 'tis true. But if you had been Geometricians -...ficient to be Professors, you would have shewed your skill much better, by making it appear that this middle Impetus could be none but that, which being taken so often, as there be Points in the Line of Time, would be equall to the sum of all the severall Impetus taken in the Points of Time respectively; which you could not do.

To the Corollary, you ask first how Impetus can be ordinately applyed to a Line; Absurdly. For does not Ar-himedes sometimes say, and with him many other excellent Geometricians, let such a Line be the Time? And do they not mean, that that Line, or the motion over it, is the measure of the Time? And may not also a Line serve to measure the swiftness of a Motion? You thought (you say) onely Lines ought to be said to be ordinately applyed to Lines. Which I easily believe; for I see you understand not that a Line, though it be not the Time it self, may be the quantity of a Time. You thought also all you have, said in your Elenchus, in your Doctrine of the Angle of Contact, in your Arithmetica Infinitorum, and in your Coniques is true; and yet it is almost all proved false, and the rest nothing worth.

Secondly, you object, that I design a Parallelogram by one onely side. It was indeed a great oversight, and argueth somewhat against the man, but nothing against his Art. For he is not worthy to be thought a Geometrician that cannot supply such a fault as that, and correct his Book himself.

Though you could not do it, yet another from beyond Sea took notice of the same fault in this manuer, He maketh a Parallelogram of but one side; it should be thus, Ve- denique per Parallelogr-... *latus est medium proportionale int-r Impetum maximum (five ultimò acquisitum) & impetûs ejusdem maximi semissem; alterum vero latus, medium proportionale, inter totum tempus, & ejus-'em totius temporis semissem.* Which I therefore repeat, that you may learn good manners; and know, that they who reprehend, ought also, when they can, to add to their reprehension the correction.

At the second Article, you are pleased to advise me, instead of *In omni motu uniformi*, to put in *In omnibus motibus uniformibus*. You have a strange opinion of your own Judgement, to think you know to what end another man useth any word, better then himself. My intention was onely to consider motions uniform, and motions from rest uniformly, or regularly accelerated, that I might thereby compute the lengths of crooked Lines, such as are described by any of those motions. And therefore it was enough to prove this Theoreme to be true in all uniform or uniformly accelerated Motion, not Motions; though it be true also in the Plurall. It seems you think a man must write all he knows, whether it conduce, or not, to his intended purpose. But that you may know that I was not, (as you think) ignorant how far it might be extended, you may read it Demonstrated at the same Article in the English universally. Against the demonstration it self you run to another Article, namely, the thirteenth, which is this Probleme, The length being given, which is passed over in a given Time by uniform Motion, to findet e length which shall be passed over by Motion uniformly accelerated in the same Time, so as that the Impetus last acquired be equall to the Time. Which you recite imperfectly, thereby to make it seem that such a Length is not determined. Whether you did this out of ignorance, or on purpose, thinking it a piece of wit, as your pretended mysterie which

goes immediately before, I cannot tell, for in neither place can any wit be espied by any but your selves. To imagine Motions with their Times and Wayes, is a new business, and requires a steady brain, and a man that can constantly read his own thoughts, without being diverted by the noise of words. The want of this ability, made you stumble and fall unhandsomely in the very first place, (that is in Cha. Art. 13.) where you venture to reckon both Motion and Time at once; and hath made you in this Chapter to stumble in the like manner at every step you go. As for example, when I say, as the product of the Time, and Impetus, to the product of the Time and Impetus, so the Space to the Space when the Motion is Uniform, you come in with nay, rather as the Time to the Time; as if the Parallelograms AI, and AH, were not also as the Times AB, and AF. Thus it is, when men venture upon ways they never had been in before, without a guide.

In the Corollary, you are offended with the permutation of the Proportion of Times and Lines, because you think, you that have scarce one right thought of the Principles of Geometry, that Line, and Time are Heterogeneous Quantities. I know Time and Line are of divers natures; and more, that neither of them is Quantity. Yet they may be both of them Quanta, that is, they may have Quantity; but that their Quantities are Heterogeneous is false. For they are compared and measured both of them by straight lines. And to this there is nothing contrary in the place cited by you out of Clavius; or if there were, 'twere not to be valued. And to your question what is the Proportion of an Hour to an Ell; I answer, it is the same Proportion that two Hours have to two Ells. You see your Question is not so subtile as you thought it. By and by you confess that in Times and Lines there is Quid Homogeneum (-...s Quid is an infallible sign of not fully understanding what you say) which is false if you take it of the Lines themselves; though if you take it of their Quantities, it is true without a Quid. Lastly, you tell me how I might have expressed myself so as it might

have been true. But because your expressions please me not, I have not followed your advice.

To the third Article, which is this, In motu uniformiter à quiete accelerato, &c. In motion uniformly accelerated from Rest, that is, when the Impetus increaseth in Proportion to the Times, The Length run over in one Time is to the Length run over in another Time, as the Product of the Impetus multiplied by the Time, to the Product of the Impetus multiplied by the Time; you object, that the Lengths run over, are in that Proportion which the Impetus hath, to the Impetus; not that which the Impetus hath to the Time, because Impetus to Time has no Proportion, as being Heterogeneous. First, when you say the Impetus, do you mean some one Impetus designed by some one of the unequall straight Lines Parallel to the Base B-? That is manifestly false. You mean the aggregate of all those unequall Parallels. But that is the same thing with the Time multiplied into the mean Impetus. And so you say the same that I do. Agai-, I ask where it is that I say or dream that the Lengths run over are in the Proportion of the Impetus to the Times? Is it you or I that dream? And for your Heterogeneity of the Quantities of Time and of Swiftnes, I have already in divers places shewed you your error. Again, Why do you make BI represent the Lengths run over, which I make to be represented by DE, a Line taken at pleasure; and you also a few Lines before make the same BI to design the greatest acquired Impetus? These are things which shew that you are puzzled and intangled with the unusuall speculation of Time and Motion, and yet are thrust on with Pride and Spi-e to adventure upon the examination of this Chapter.

Secondly, you grant the Demonstration to be good, supposing I meane it (as I seeme to speak) of one and the same Motion. But why doe I not meane it of one and the same Motion, when I say not in Motions, but in Motion uniform? Because (say you) in that which follows, I draw it also to different

Motions. You should have given at least one Instance of it; but there is no such matter. And yet the Proposition, is in that case also true; though then it must not be Demonstrated by the similitude of Triangles, as in the case present. And therefore the objections you make from different Impetus acquired in the same time, and from other cases which you mention, are nothing worth.

At the fourth Article, you allow the Demonstration all the way (except the faults of the third, which I have already proved to be none) till I come to say, that because the Proportion of FK to BI is double to the Proportion of AF to AB, therefore the Proportion of AB to AF is double to the Proportion of BI to FK. This you deny, and wonder at, as strange (for it is indeed strange to you) and in many places you exclaim against it as extream Ignorance in Geometry. In this place you onely say, No such matter; for though one Proportion be double to another, yet it does not follow that the Converse is the double of the Converse. So that this is the issue to which the Question is reduced, whether you have any or no Geometry. I say, if there be three Quantities in continuall Proportion, and the first be the least, the Proportion of the first to the second is double to the Proportion of the first to the third; and you deny it. The reason of our dissent consisteth in this, that you think the doubling of a Proportion to be the doubling of the Quantity of the Proportion, as well in Proportions of Defect, as in Proportions of Excess; and I think that the doubling of a Proportion of Defect, is the doubling of the defect of the Quantity of the same. As for example in these three numbers, 1, 2, 4, which are in continuall Proportion, I say the Quantity of the Proportion of one to two, is double the Quantity of the Proportion of one to four. And the Quantity of the Proportion of one to four, is half the Quantity of the Proportion of one to two. And yet deny not but that the Quantity of the Defect in the Proportion of one to two is doubled in the Proportion of one to four. But because the

doubling of defect makes greater defect, it maketh the Quantity of the Proportion less. And as for the part which I hold in this Question, first, there is thus much demonstrated by Euclide, E-. 5. Pro; that the Proportion of one to two is greater then the Proportion of one to four, though how much it is greater be not there Demonstrated. Secondly, I have Demonstrated (Cha. A- t. 16.) That it is twice as great, that is to say, (to a man that speaks English) double. The introducing of duplicate, triplicate, &c. instead of double, triple, &c. (though now they be words well understood by such as understand what Proportion is) proceeded at first from such as durst not for fear of absurdity, call the half of any thing double to the whole, though it be manifest that the half of any defect is a double Quantity to the whole defect; -or want added to want maketh greater want, that is, a less positive Quantity. This difference between double, and duplicate, lighting upon weak understandings, has put men out of the way of true reasoning in very many Questions of Geometry. Euclide never used but one word both for double and duplicate. It is the same fault when men call half a Quantity Subduplicate, and a third part Subtriplicate of the whole, with intention (as in this case) to make them pass for words of signification different from the half and the third part. Besides, from my Definition of Proportion (which is clear, and easie to be understood by all men, but such as have read the Geometry of others unluckily) I can Demonstrate the same evidently and briefly thus. My Definition is this, Proportion is the Quantity of one Magnitude taken comparatively to another. Let there be therefore three Quantities, 1, 2, 4, in continuall Proportion. Seeing therefore the Quantity of four in respect of one, is twice as great as the Quantity of the same four in respect of 2, it followeth manifestly that the Quantity of 1 in respect of 4, is twice as little as the Quantity of the same 1 in respect of 2; and consequently the Quantity of one in respect of two, is twice as great as the Quantity of the same one in respect of four; which is the thing I maintain in

this Question Would not a man that imployes his time at Bowles, choose rather to have the advantage given him of three in nine, then of one in nine? And why, but that three is a greater Quantity in respect of nine, then is one? Which is as much as to say, three to nine hath a greater Proportion then one to nine; as is Demonstrated by Euclide, El. 5. . Is it not therefore (you that profess Mathematicques, and Theology, and practise the depression of the truth in both) well ow-'d of you, to teach the contrary? But where you say that the Point K (in the second Figure of the Table belonging to this 16. Chapter) is not in the Parabolicall Line whose Diameter is AB, and Base BI, but in the Parabolicall Line of the Complement of my Semiparabola (as I may learn from the twenty-third Proposition of your Arithmetica Infinitorum) whose Diameter is AC, and Base IC. What Line is that? Is it the same Line with that of my Semiparabola, or not the same? If the same, why find you fault? If not the same, you ought to have made a Semiparabola on the Diameter AC, and Base IC, and following my Const-uction made it appear that K is not in the Line wherein I say it is; which you have not done, nor could do.

Then again, running on in the same blindness of Passion, you pretend I make the Proportion of BI to FK double to that of AB to AF, and then confute it; when you knew I made the Proportion of FK to BI, double to that of FN, to BI, that is, of AF to AB; and this was it you should have confuted. That which followeth is but a Triumphant in your own Ignorance, wherein you also say, That all that I afterwards build upon this Doctrine is false. You see whether it be like to prove so or not. As for your Arithmetica Infinitorum, I shall then read to you a piece of a Lesson on it when I come to your objections against the next Chapter. In the mean Time let me tell you, it is not likely you should be great Geometricians, that know not what is Quantity, nor Measure, nor Straight, nor Angle, nor Homogeneous, nor

Heterogeneous, nor Proportion, as I have already made appear in this and the former Lessons.

To the first Corollary of this fourth Article your exception I confess is just, and (which I wonder at) without any incivility. But this argues not Ignorance, but Security. For who is there that ever read any thing in the Coniques, that knows not that the parts of a Parabola cut off by Lines Parallel to the Base, are in Triplicate Proportion to their Bases? But having hitherto designed the Time by the Diameter, and the Impetus by the Bas-; and in the next Chapter (where I was to calculate the Proportion of the Parabola, to the Parallelogram) intending to design the Time by the Base, I mistook and put the Diameter again for the Time; which any man but you might as easily have corrected as reprehended.

To the second Corollarie, which is this, That the Lengths run over in equall Times by Motion so accelerated, as that the Imperus increase in double Proportion to their Times, are as the differences of the Cubick numbers beginning at unity, that is, as seven, nineteen, thirty-seven, &c. You say 'tis false. But why? Because (say you) portions of the Parabola of equall altitude taken from the beginning are not as those numbers seven, nineteen, thirty-seven, &c. Does this think you, contradict any thing in this Proposition of mine? Yes, because (you think) the lengths gone over in equall Times, are the same with the parts of the Diameter cut off from the Vertex, and proportionall to the numbers one, two, three, &c. Whereas the lengths run over, are as the aggregates of their velocities, that is, as the parts of the Parabola itself, that is, as the Cubes of their Bases, that is, as the numbers one, eight, twenty-seven, sixty-four, &c. and consequently the lengths run over in equall Times, are as the differences of those Cubick Numbers one, eight, twenty-seven, sixty-four, whose differences are seven, nineteen, thirty-seven, &c. The cause of your mistake was, that you cannot

yet, nor perhaps ever will contempla-e Time and Motion (which requi-eth a steddiness) without confusion.

The third Corollary, you also say is false, Whether it be meant of Motion uniformly accelerated (as the words are) or (as perhaps, you say, I meant it) of such Motion as is accelerated in double Proportion to the Time. You need not say perhaps I meant it. The words of the Proposition are enough to make the meaning of the Corollary understood. But so also you say it is false. Me thinks you should have offered some little proof to make it seem so. You think your Authority will carry it. But on the contrary I believe rather that they that shall see how your other objections hitherto have sped, will rather think it true, because you think it false. The Demonstration as it is, is evident enough; and therefore I saw no cause to change a word of it.

To the fifth Article you object nothing, but that it dependeth on this Proposition (Cha. Art. 16.) That when three Quantities are in continual Proportion, and the first is the least, as in these numbers, four, six, nine. The Proportion of the first to the second is double to the Proportion of the same first to the last. Which is there demonstrated, and in the former Lessons so amply explicated, as no man can make any further doubt of the truth of it. And you will, I doubt not assent unto it. But in what estate of mind will you be then? A man of a tender forehead after so much insolence, and so much contumelious language grounded upon arrogance and ignorance, would hardly endure to out-live it. In this vanity of yours, you ask me whether I be angry, or blush, or can endure to hear you. I have some reason to be angry; for what man can be so patient as not to be moved with so many injuries? And I have some reason to blush, considering the opinion men will have beyond Sea, (when they shall see this in Latine) of the Geometry taught in Oxford. But to read the worst you can say against me, I can endure, as easily at least, as to read any thing you have written in your Treatises of the Angle of Contact, of the Conique-sections, or your Arithmetica Infinitorum.

The sixth, seventh, eighth Articles, you say are sound. True. But never the more to be thought so for your approbation, but the less; because you are not fit, neither to reprehend, nor praise; and because all that you have hitherto condemned as false, hath been proved true. Then you shew me how you could demonstrate the sixth and seventh Articles a shorter way. But though there be your Symbols, yet no man is obliged to take them for demonstration. And though they be granted to be dumb Demonstrations, yet when they are taught to speak as they ought to do, they will be longer Demonstrations than these of mine.

To the ninth Article, which is this, If a Body be moved by two Motions at once, concurring in what Angle soever, of which, one is moved uniformly, the other, with Motion uniformly accelerated from Rest, till it acquire an Impetus equal to that of the uniform motion, the line in which the Body is carried, shall be the crooked line of a Semiparabola. You lift up your voice again, and ask what Latitude? what Diameter? what Inclination of the Diameter to the Ordinate Lines? If your Founder should see this, or the like objections of yours, he would think his money ill bestowed. When I say in what Angle soever, you ask, in what Angle? When I say two Motions, one uniform, the other uniformly accelerated, make the Body describe a Semiparabolicall line; you ask, which is the Diameter; as not knowing that the accelerated motion describes the Diameter, and the other a Parallel to the Base. And when I say the two Motions meet in a Point, from which Point both the Motions begin, and one of them from Rest, you ask me, what is the Altitude? As if that Point where the Motion begins from Rest were not the Vertex; or that the Vertex and Base being given, you had not wit enough to see that the Altitude of the Parabola is determined? When Galileo's Proposition, which is the same with this of mine, supposed no more but a Body moved by these two Motions, to prove the Line described to be the crooked Line of a Semiparabola, I never thought of asking him

what Altitude, nor what Diameter, nor what Angle, nor what Base had his Parabola. And when Archimedes said, let the Line A B be the Time, I should never have said to him, do you think Time to be a Line, as you ask me whether I think Impetus can be the Base of a Parabola. And why, but because I am not so egregious a Mathematician, as you are. In this giddiness of yours, caused by looking upon this intricate business of Motion, and of Time, and the concourse of Motion uniform, and uniformly accelerated, you rave upon the numbers 1, 4, 9, 16, &c. without reference to any thing that I had said; insomuch as any one that had seen how much you have been deceived in them before in your scurvy Book of Arithmetica Infinitorum, would presently conclude, that this objection was nothing else but a fit of the same madness which possest you there.

My tenth Article is like my ninth; and your objections to it are the same which are to the former. Therefore you must take for answer just the same which I have given to your objection there.

To the eleventh, you say first, you have done it better at the sixty-fourth Article of your Arithmetica Infinitorum. But what you have done there, shall be examined when I come to the Defence of my next Chapter. And whereas I direct the Reader for the finding of the Proportions of the Complements of those Figures to the Figures themselves, to the Table of Art. 3. Cha. you say that if the encrease of the Spaces, were to the encrease of the Times, as one to two, then the complement should be to the Parallelogram as one to three, and say you find not $\frac{1}{3}$ in the Table. Did you not see that the Table is onely of those Figures which are described by the concourse of a Motion uniform with a motion accelerated? You had no reason therefore to look for $\frac{1}{3}$ in that Table; for your case is of Motion uniform concurring with Motion retarded, because you make not the Proportions of the Spaces to the Proportions of the Times as two to one, but the contrary; so that your objection ariseth from want of observing what you

read. But I may learn (you say) these, and greater Matters then these, in your twenty-third and sixty-fourth Propositions of your Arithmetica Infinitorum. This which you say here is a great Absurdity; but if you mean I shall finde greater there, I will not say against you. This $\frac{1}{3}$ you looked for, belongs to the Complements of the Figures calculated in that Table; which because you are not able to find out of your selves, I will direct you to them. Your case is of $\frac{1}{3}$ for the Complement of a Parabola. Take the Denominator of the Fraction which belongs to the Parabola, namely three, and for Numerator take the Numerator of the Fraction which belongs to the Triangle, namely one, and you have the Fraction sought. And in like manner for the Complement of any other Figuer. As for example, of the second Parabolaster, whose Fraction hath for Denominator five, take the Numerator of the Fraction of the same Triangle which is one, and you have $\frac{1}{5}$ for the Fraction sought for; and so of the rest, taking alwayes one for the Numerator.

The twelfth Article, which you say is miserably false, I have left standing unaltered. For not comprehending the sense of the Proposition, you make a Figure of your own, and fight against your own fancied Motions, different from mine. Other Geometricians that understand the construction better, find no fault. And if you had in your own fifth Figure drawn a Line through N Parallel to A E, and upon that Line supposed your accelerated Motion, you would quickly have seen that in the Time AE, the Body moved from Rest in A, would have fallen short of the Diagonall A D; and that all your extravagant pursuing of your own mistake had been absurd.

My thirteenth Article you say is ridiculous. But why? The Impetus last acquired cannot (you say) be equall to a Time. But the Quantity of the Impetus may be equall to the Quantity of a Time, seeing they are both measured by Line. And when they are measured by the same described Line, each of their Quantities is equall to that same Line, and consequently

to one another. But when I meet with this kind of objection again, since I have so often already shewn it to be frivolous, and no less to be objected against all the Antients that ever Demonstrated any thing by Motion, then against me, I purpose to neglect it.

Secondly, you object That Motion uniformly accelerated does no more determine Swiftness, then Motion uniform. True; you needed not have used sixteen Lines to set down that. But suppose I add (as I do) so as the last acquired Impetus be equall to the Time. But that (you say) is not sense; Which is the objection I am to neglect. But (you say again) supposing it sense, this limitation helps me nothing. Why? Because (you say) a Parabola may be described upon a Base given, and yet have any Altitude, or any Diameter one will. Who doubts it? But how follows it from thence, that when a Parabolicall Line is described by two Motions, one uniform, the other uniformly accelerated from Rest, that the determining of the Base does not also determine the whole Parabola? But fifthly (you say) that this equality of the Impetus to the Time does not determine the Base. Why not? Because (you say) it is an error proceeding from this, that I understand not what is Ratio subduplicate. I look't for this. I have shewn and inculcated sufficiently before, that the error is on your side; and therefore must tell you, that this objection, and also a great part of the rest of your errors in Geometry proceedeth from this, that you know not what Proportion is. But see how wisely you argue about this duplication of Proportion. For thus you say verbatim. Stay a little. What Proportion has duplicate Proportion to single Proportion? Is it alwayes the same? I think not. For example. Duplicate Proportion is double to the single $2/1$. Duplicate Proportion is triple to its single $3/1$. Let any man, even of them that are most ready in your Symboles, say in your behalf (if he be not ashamed) that the Proportion of nine to one is triple to the Proportion of three to one, as you do.

In the fourteenth, fifteenth, and sixteenth Article, you bid me repeat your objections to the thirteenth. I have done it; and find that what you have objected to the thirteenth, may as well be objected to these; and consequently, that my answer there will also serve me here. Therefore (if you can endure it) read the same answer over again.

But you have not yet done (you say) with these Articles. Therefore (after you had for a while spoken perplexly, conjecturing not without just cause, that I could not understand you) you say that to the end I may the better perceive your meaning, I should take the example following. Let a Movent (in the first Figure of this Chapter) be moved uniformly, in the Time A B, with the continuall Impetus A C, or B I, whose whole velocity shall therefore be the Parallelogram A C I B. And another Movent be uniformly accelerated, so as in the Time A B it acquire the same Impetus B I. Now as the whole velocity, is to the whole velocity, so is the length run over, to the length run over. All this I acknowledge to be according to my sense, saving that your putting your word *Movens* instead of my word *Mobile* hath corrupted this Article. For in the first Article, I meddle not with Motion by Concourse, wherein only I have to do with two Movents to make one Motion; but in this I do, wherein my word is not *Movens* but *Mobile*; by which it is easie to perceive you understand not this Proposition. Then you proceed, But the length run over by that accelerated Motion is greater then the length run over by that unifo-... Motion. Where do I say that? You answer, in the ninth and thirteenth Article, in making (in the fifth Figure) greater then A C; and A H (in the eighth Figure) greater then A B; and consequently, the Triangle A B I, greater then the Parallelogram A C I B. That consequently is without consequence; for it importeth nothing at all in this Demonstration, whether A B, or A C in the fifth Figure be the greater. Besides, I speak there of the Concourse of two Movents that describe the Parabolicall Line A G D; where the increasing Impetus, (because it

increaseth as the Times) will be designed by the Ordinate Lines in the Parabola A G D B. And if both the Motions in A B and A C were uniform, the Aggregate of the Impetus would be designed by the Triangle A B D, which is less then the Parallelogram A C D B. But you thought that the Motion made by A C uniformly, is the same with the Motion made uniformly in the same Time by the Motions in A B, and A C, concurring. So likewise in the eighth Figure, there is nothing hinders A H from being greater then A B, unless I had said that A B had been described in the Time A C with the whole Impetus A C maintained entire; of which there is nothing in the Proposition, nor would at all have been pertinent to it. Therefore all this new undertaking of the thirteenth, fourteenth, fifteenth and sixteenth Articles, is to as little purpose as your former objections. But I perceive that these new and hard Speculations, though they turn the edge of your wit, turn not the edge of your malice.

At the seventeenth Article, you shew again the same confusion. Return to the eighth Figure, If in a Time given a Body run over two lengths, one with uniform, the other with accelerated Motion; as for example, if in the same Time A C a Body run over the Line A B with uniform Motion, and the Line A H with Motion accelerated; and again in a part of that Time it run over a part of the length A H, with uniform Motion, and another part of the same with Motion accelerated; as for example, in the Time A M it run over with uniform Motion the Line A I, and with Motion accelerated the Line A B. I say the excess of the whole A H above the part A B, is to the excess of the whole A B above the part A I, as the whole A H, to the whole A B. But first you will say, that these words as the whole A H to the whole A B, are left out in the Proposition. But you acknowledge that it was my meaning; and you see it is expressed before I come to the Demonstration. And therefore it was absurdly done to reprehend it. Let us therefore pass to the Demonstration. Draw I K Parallel to A C, and make up the Parallelogram A

I K M. And supposing first the acceleration to be uniform, divide I K in the midst at N; and between I N, and I K, take a mean Proportionall I L. And the straight Line A L, drawn and produced, shall cut the Line B D in F, and the Line C G in G (which Lines C G, and B D, as also H G and B F, are determined (though you could not carry it so long in memory) by the Demonstration of the thirteen Article.) For seeing A B is described by Motion uniformly accelerated, and A I by Motion uniform to the same Time A M; and I L is a mean Proportionall between I N (the half of I K) and I K; therefore by the Demonstration of the thirteenth Article; A I is a mean Proportionall between A B and the half of A B, namely A O. Again, because A B is described by uniform Motion, and A H by Motion uniformly accelerated, both of them in the same Time A C, B F is a mean Proportionall between B D and half B D, namely B E; Therefore by the Demonstration of the same thirteenth Article, the straight Line A L F produced will fall on G; and the Line A H will be to the Line A B, as the Line A B to the Line A I. And consequently as A H to A B, so H B to B I; which was to be Demonstrated. And by the like Demonstration the same may be proved, where the acceleration is in any other Proportion that can be assigned in Numbers, saving that whereas this Demonstration dependeth on the construction of the thirteenth Article, if the Motion had been accelerated in double Proportion to the Times, it would have depended on the fourteenth, where the Lines are determined. Which determinations being not repeated, but declared before in the thirteenth Article, to which this Diagram belongeth, you take no notice of, but go back to a Figure belonging to another Article where there was no use of these Determinations. But because I see that the words of the Proposition, are as of four Motions, and not of two Motions made by twice two Movents, I must pardon them that have not rightly understood my meaning; and I have now made the Proposition according to the Demonstration. Which being done, all that you

have said in very neer two leaves of your Elenchus comes to nothing; and the fault you find comes to no more then a too much trusting to the skill and diligence of the Reader. And whereas after you had sufficiently troubled your self upon this occasion, you add, that if Sir H. Savile had read my Geometry, he had never given that censure of Joseph Scaliger, in his Lectures upon Euclide, that he was the the worst Geometrician of all Mortall men, not excepting so much as Orontius, but that praise should have been kept for me; You see by this time, at least others do, how little I ought to value that opinion; and that though I be the least of Geometricians, yet my Geometry is to yours as 1 to 0. I recite these words of yours, to let the world see your indiscretion in mentioning so needlesly that passage of your Founder. It is well known that Joseph Scaliger deserved as well of the state of Learning, as any man before or since him; and that though he failed in his Ratiocination concerning the Quadrature of the Circle, yet there appears in that very failing so much knowledge of Geometry, that Sir H. Savile could not but see that there were mortall men very many that had less; and consequently he knew that that censure of his in a rigid sense (without the License of an Hyperbole) was unjust. But who is there that will approve of such Hyperboles to the dishonour of any but of unworthy persons, or think Joseph Scaliger unworthy of honour from Learned men? Besides, it was not Sir H. Savile that confuted that false Quadrature, but Clavius. What honour was it then for him to triumph in the victory of another? When a beast is slain by a Lion, is it not easie for any of the Fowles of the Air to settle upon, and peck him? Lastly, though it were a great error in Scaliger, yet it was not so great a fault as the least Sin; and I believe that a publique contumely done to any worthy person after his death, is not the least of Sins. Judge therefore whether you have not done indiscreetly, in reviving the onely fault, perhaps that any man living can lay to your Founders charge; and yet this error of Scaligers was no greater then one of your own of the like

nature, in making the true Spirals of Archimedes equall to half the circumference of the Circle of the first revolution; and then thinking to cover your fault by calling it afterwards an Aggregate of Arches of Circles (which is no Spirall at all of any kind) you do not repair but double the absurdity. What would Sir Henry Savile have said to this?

The eighteenth Article is this, In any Parallelogram, if the two sides that contain the Angle be moved to their opposite sides, the one uniformly, the other uniformly accelerated; the side that is moved uniformly, by its concurrence through all its Longitude, hath the same effect which it would have if the other Motion were also uniform, and the Line described, were a mean Proportionall between the whole Length, and the half of the same.

To the Proposition you object first, that it is all one whether the other motion be uniform or not, because the effect of each of their Motions, is but to carry the Body to the opposite side. But do you think that whatsoever be the Motions, the Body shall be carryed by their concurrence alwayes to the same Point of the opposite side? If not, then the effect is not all one when a Motion is made by the concurrence of two Motions uniform and accelerated, and when it is made by the concurrence of two uniform or of two accelerated Motions.

Secondly, you say that these words, and the Line described were a mean Proportionall between the whole Length, and the half of the same, have no sense, or that you are deceived. True. For you are deceived; or rather you have not understanding enough distinctly to conceive variety of Motions though distinctly expressed. For when a Line is gone over with Motion uniformly accelerated, you cannot understand how a mean Proportionall can be taken between it and its half; or if you can, you cannot conceive that that mean can be gone over with uniform motion in the same Time that the whole Line was run over by motion uniformly accelerated. Yet these are things conceivable, and your want of understanding must be made my fault.

My Demonstration is this, In the Parallelogram A B C D, (Fig. 11.) Let the side A B be conceived to be moved uniformly till it lye in C D; and let the Time of that Motion be A C, or B D. And in the same Time let it be conceived that A C is moved with uniform acceleration, till it lye in B D. To which you object, that then the acceleration last acquired must be far greater then that wherewith A B is moved uniformly; else it shall never come to the place you would have it in the same Time. What proof bring you for this? None here. Where then? No where that I remember. On the contrary I have proved (Art. 9. of this Chapter) that the Line described by the concurrence of those two Motions, namely, uniform from A B to C D, and uniformly accelerated from A C to B D, is the crooked Line of the Semi-parabola A H D. And though I had not, yet it is well known that the same is demonstrated by Galileo. And seeing it is manifest that in what Proportion the Motion is accelerated in the Line A B, in the same Proportion the Impetus beginning from Rest in A is encreased in the same Times (which Impetus is designed all the way by the ordinate Lines of the Semi-Parabola) the greatest Impetus acquired must needs be the Base of the Semiparabola, namely B D, equal to A C which designs the whole Time. I cannot therefore imagine what should make you say without proof, that the greatest acquired Impetus is greater then that which is designed by the Base B D. Next you say, you see not to what end I divide A B in the middle at E. No wonder; for you have seen nothing all the way. Others would s — it is necessary for the Demonstration; as also that the Point F is not to be taken arbitrarily; and likewise that the thirteenth Article (which you admit not for proof) is sufficiently demonstrated, and your objections to it answered. By the way you advise me, where I say *percursum eodem motu uniformi, cum Impetu ubi{que} &c.* to blot out *cum*; because the Impetus is not a companion in the way, but the cause. Pardon me in that I cannot take your Learned Counsell; for the word *motu uniformi* is the Ablative of the Cause, and

Impetu the Ablative of the Manner. But to come again to your objections, you say I make a greater space run over in the same Time by the slower Motion then by the swifter. How does that appear? because there is no doubt, but the swiftness is greater where the greatest Impetus is alwaies maintained, then where it is attained to in the same Time from Rest. True, But that is when they are considered asunder without concourse, but not then when by the concourse they debilitate one another, and describe a third Line different from both the Lines, which they would describe singly. In this place I compare their effects as contributing to the the description of the Parabolicall Line A H D. What the effects of their severall Motions are, when they are considered asunder, is sufficiently shewn b-fore in the first Article. You should first have gotten into your mindes the perfect and distinct Ideás of all the Motions mentioned in this Chapter, and then have ventured upon the censure of them, but not before. And then you would have seen that the Body moved from A, describeth not the Line A C, nor the Line A B, but a third, namely the Semiparabolicall Line A H D.

Again, where I say, Wherefore if the whole A B be uniformly moved to C D, in the same Time wherein A C is moved uniformly to F G; you ask me whether with the same Impetus or not. How is it possible that in the same time two unequall Lengths should be passed over with the same Impetus? But why (say you) do you not tell us with what Impetus A C comes to F G? What need is there of that, when all men know that in unifo-m Motion and the same Time, Impetus is to Impetus, as Length to Length? Which to have expressed had not -een pertinent to the Demonstration. That which follows in the Demonstration rursus suppono quod latus A C, &c. to these words, ut ostensum est, Art. 12, You confute with saying you have proved that Article to be false. But you may see now, if you please, at the same place that I have proved your objections to be frivolous.

After this you run on without any Argument against the rest of the Demonstration, shewing nothing all the way, but that the variety and concourse of Motions, the Speculations whereof you have not been used to, have made you giddy.

To the nineteenth Article you apply the same objection which you made to the eighteenth. Which having been answered, it appears that from the very beginning of your Elenchus to this place all your objections (except such as are made to three or four mistakes of small importance in setting down my mind,) are meer Paralogisms, and such as are less pardonable then any Paralogism in Orontius, both because the Subject as less difficult is more easily mastered, and because the same faults are more shamefully committed by a Reprehender then by any other man.

I had once added to these nineteen Articles a twentieth, which was this, If from a Point in the Circumference there be drawn a Chord, and a Tangent equall to it, the Angle which they make shall be double to the aggregate of all the Angles made by the chords of all the equal Arches into which the Arch given can possibly be divided. Which Proposition is true, and I did when I writ it think I might have use of it. But be it, or the Demonstration of it true or false, seeing it was not published by me, it is somewhat barbarous to charge me with the faults thereof. No Doctor of Humanity but would have thought it a poor and wretched malice, publicly to examine and censure papers of Geometry never published, by what means soever they came into his hands. I must confess that in these words, in such kind of Progression Arithmetically (that is, which begins with 0) the sum of all the Numbers taken together, is equall to half the Number that is made by multiplying the greatest into the least, there is a great error; for by this account these Numbers, 0, 1, 2, 3, 4, taken together should be equall to nothing. I should have said they are equall to that Number which is made by multiplying half the greatest into the Number of the Terms. There was

therefore, if those words were mine (for truly I have no Copy of them, nor have had since the Book was Printed, and I have no great reason, as any man may see, to trust your Faith) a great error in the writing, but not an erroneous opinion in the writer. The Demonstration so corrected is true. And the Angles that have the Proportions of the Numbers 1, 2, 3, 4, are in the Table of your Elenchus, Fig. 12. the Angles $G A D$, $H D E$, $I E F$, $K F B$. And if the Divisions were infinite, so that the first were not to be reckoned but as a cypher, the Angle $C A B$ would be double to them all together. This mistake of mine, and the finding that I had made no use of it in the whole book, was the cause why I thought fit to leave it quite out. But your Professorships, could not forbear to take occasion thereby, to commend your zeal against Leviathan to your Doctorships of Divinity, by censuring it.

**OF THE FAULTS THAT OCCURRE IN DEMONSTRATION.
TO THE SAME EGREGIOUS PROFESSORS OF THE
MATHEMATICKS IN THE UNIVERSITY OF OXFORD.
LESSON V.**

AT THE SEVENTEENTH Chapter, your first exception is to the Definition of Proportionall Proportions, which is this, Four Proportions are then Proportionall, when the first is to the second, as the third to the fourth. The Reader will hardly believe that your exception is in earnest. You say I mean not by Proportionality the Quantity of the Proportions. Yes I do, Therefore I say again, that four Proportions are then Proportionall, when the Quantity of the first Proportion, is to the Quantity of the second Proportion, as the Quantity of the third Proportion, to the Quantity of the fourth Proportion. Is not my meaning now plainly enough expressed? Or is it not the same Definition with the former? But what do I mean (you will say) by the Quantity of a Proportion? I mean the determined greatness of it, that is, for example, in these Numbers, the Quantity of the Proportion of two to three, is the same with the Quantity of the Proportion of four to six, or six to nine; and again, the Quantity of the Proportion of six to four, is the same with the Quantity of the Proportion of nine to six, or of three to two. But now what do you mean by the Quantity of a Proportion? You mean that two and three, are the Quantities of the Proportion of two to three (for so Euclide calls them) and that six and four are the Quantities of the Proportion of six to four, which is the same with the Proportion of three to two. And by this Rule, one and the same Proportion shall have an infinite Number of Quantities; and consequently the Quantity of a Proportion can never be

determined. I call one Proportion double to another, when one is equall to twice the other; as the Proportion of four to one, is double to the Proportion of two to one. You call that Proportion double where one Number, Line, or Quantity absolute is double to the other; so that with you the Proportion of two to one is a double Proportion. It is easie to understand how the Number two is double to one, but to what I pray you, is double the Proportion of two to one, or of one to two? Is not every double Proportion double to some Proportion? See whether this Geometry of yours can be taken by any man of sound mind for sense. But 'tis known (you say) that in Proportions double is one thing, and duplicate another; So that it seems to you, that in talking of Proportion men are allowed to speak senselessly. 'Tis known, you say. To whom? It is indeed in use at this day to call jouble duplicate, and triple triplicate. And it is well enough; for they are words that signifie the same thing, But that they differ (in what subject soever) I never heard till now. I am sure that Euclide whom you have undertaken to expound, maketh no such difference. And even there where he putteth these Numbers, one, two, four, eight, &c. for Numbers in double Proportion (which is the last Proposition of the nineth Element) he meaneth not that one to two, or two to one, is a double Proportion, but that every Number in that Progression is double to the number next before it; and yet he does not call it Analogia dupla, but Duplicata. This distinction in Proportions between double and duplicate, proceeded long after from want of knowledge that the Proportion of one to two is double to the Proportion of one to four; and this from ignorance of the different nature of Proportions of Excess, and Proportions of Defect. And you that have nothing but by tradition saw not the absurdities that did hang thereon.

In the second Article I make E K, (Fig. 1.) the third part of L K, which you say is false; and consequently the Proposition undemonstrated. And thus you prove it false. Let A C be to G C, or G K to G L, as eight to one

(for seeing the Point G is taken arbitrarily, we may place it where we will, &c.) and upon this placing of G arbitrarily, you prove well enough that $E K$ is not a third part of $L K$. But you did not then observe, that I make the Altitude $A G$, less then any Quantity given, and by consequence $E K$ to differ from a third part by a less difference then any Quantity that can be given. Therefore as yet the Demonstration proceedeth well enough. But perceiving your oversight, you thought fit (though before, you thought this confutation sufficient) to endeavour to confute it another way; but with much more evidence of ignorance. For when I come to say, the Proportion therefore between $A C$ and $G C$ is triple (in Arithmetically Proportion) to the Proportion between $G K$ and $G E$, &c. you say the Proportion of $A C$ to $G C$, is the Proportion of Identity, as also that of $G K$ to $G E$. But why? Does my construction make it so? Do not I make $G C$ less then $A C$, though with less Difference then any Quantity that can be assigned? And then where I say therefore $E K$ is the third part of $L K$, you come in (by Parenthesis) with (or a fourth, or a fifth &c.) Upon what ground? Because you think it will pass for current, without proof, that a Point is nothing. Which if it do, Geometry also shall pass for nothing, as having no ground nor beginning but in nothing. But I have already in a former Lesson sufficiently shew'd you the consequence of that opinion. To which I may add, that it destroys the method of Indivisibles, invented by Bonaventura; and upon which, not well understood, you have grounded all your scurvy book of *Arithmetica Infinitorum*; where your Indivisibles have nothing to do, but as they are supposed to have Quantity, that is to say, to be Divisibles. You allow, it seems, your own nothings to be somethings, and yet will not allow my somethings to be considered as nothing. The rest of your objections having no other ground then this, that a Point is nothing, my whole Demonstration standeth firm; and so do the Demonstrations of all such Geometricians, Ancient and Modern, as have inferred any thing in the manner following,

viz. If it be not greater nor less, then it is equall. But it is neither greater nor less. Therefore, &c. If it be greater, say by how much. By so much. 'Tis not greater by so much. Therefore it is not greater. If it be less, say by how much, &c. Which being good Demonstrations are together with mine overthrown by the nothingness of your Point, or rather of your unstanding; upon which you nevertheless have the vanity of advising me what to do, if I demonstrate the same again; meaning I should come to your false, impossible, and absurd Method of Arithmetica Infinitorum, worthy to be gilded, I do not mean with Gold.

And for your Question, why I set the Base of my Figure upwards, you may be sure it was not because I was affraid to say, that the Proportions of the ordinate Lines beginning at the Vertex were triplicate, or otherwise multiplicate of the Proportions of the intercepted parts of the Diameter. For I never doubted to call double duplicate, nor triple triplicate, &c. or if I had, I should have avoided it afterwards at the tenth Article of the same Chapter. But because when I went about to compare the Proportions of the ordinate Lines with those of their contiguous Diameters, the first thing I considered in them was in what manner the Base grew less and less till it vanished into a Point. And though the base had been placed below, it had not therefore required any change in the Demonstration. But I was the more apt to place the Base uppermost, because the Motion began at the Base, and ended at the Vertex. To proceed which way I pleased was in my own choice; and it is of grace that I give you any account of it at all.

To the third Article together with its Table, you say, it falls in the ruine of the second; and that the same is to be understood of the sixth, seventh, eighth and ninth. For confutation whereof I need to say no more, but that they all stand good by the confutation of your objections to the second.

To the fourth Article you say, the description of those curvilineall Figures is easie. True, to some men; and now that I have shewed you the

way, 'tis easie enough for you also. For the way you propound is wholly transcribed out of the Figure of the second Article, which Article you had before rejected. For seeing the Lines HF, GE, AB, &c. are equall to the Lines CQ, CO, CD; and the Lines QF, OE, DB, equall to the Lines CH, CG, CA; the Proportion of DB to OE, will be triple (that is, triplicate) to the Proportion of CO to GE; and the Proportion of DB to QF, triple to the Proportion of CD to CQ; and consequently, because the Complement BDCFEB is made by the decrease of AC in triple Proportion to that of the decrease of CD, it will be (by the second Article) a third part of the Figure ABEFCA. So that it comes all to one pass, whether we take triple Proportion in decreasing to make the Complement, or triple Proportion in increasing to make the Figure; for the Proportion of HF to BA, is triple to the Proportion of CH to CA. Wherefore you have done no more but what you have seen first done, saving that from your construction you prove not the Figure to be triple to the Complement; perhaps because you have proved the contrary in your Arithmetica Infinitorum. But your way differs from mine, in that you call the Proportion subtriplicate, which I call triplicate; as if the divers naming of the same thing made it differ from its self. You might as well have said briefly, the Proposition is true, but ill proved, because I call the Proportion of one to two triple, or triplicate of that of one to eight; which you say is salse, and hath infected the fourth, fifth, ninth, tenth, eleventh, thirteenth, fourteenth, fifteenth, sixteenth, seventeenth and nineteenth Articles of the sixteenth Chapter. But I say, and you know now, that it is true; and that all those Articles are Demonstrated.

Lastly you add, *Tu vero, in presente Articulo, &c. id est*, you bid find as many mean Proportionals as one will, between two given Lines; as if that could not be done by the Geometry of Plains, &c. You might have left out *Tu vero* to seek an *Ego quidem*. But tell me, do you think you can find two mean Proportionals (which is less then as many as one will) by the

Geometry of Plaines? We shall see anon how you go about it. I never said it was impossible, and if you look upon the places cited by you more attentively, you will find your self mistaken. But I say, the way to do it has not been yet found out, and therefore it may prove a solid Probleme for any thing you know.

The fifth Article you reject, because it citeth the Corollarie of the twenty-eighth Article of the thirteenth Chapter, where there is never a word to that purpose. But there is in the twenty-sixth Article; which was my own fault, though you knew not but it might have been the Printers.

To the tenth you object for almost three leaves together, against these words of mine, Because (in the sixth Figure) BF is to BE in triplicate Proportion of CD to FE, therefore inverting, FE is to CD in triplicate Proportion of BF to BC. This you objected then. But now that I have taught you so much Geometry, as to know that of three Quantities, beginning at the least, if the third be to the first in triplicate Proportion of the second to the first, also by conversion the first to the second shall be in triplicate Proportion of the first to the third; if it were to do again, you would not object it.

My eleventh Article you would allow for demonstrated, if my second had been Deccenstrated, upon which it dependeth. Therefore seeing your objections to that Article are sufficiently answered, this Article also is to be allowed.

The twelfth also is allowed upon the same reason. What falsities you shall finde in such following Propositions as depend upon the same second Article, we shall then see when I come to the places where you object against them.

To the thirteenth Article you object, That the same Demonstration may be as well applyed to a Portion of any Conoeides Parabolicall, Hyporbolicall, Ellipticall, or any other, as to the Portion of a Sphere. By the

truth of this let any man judge of your and my Geometry. Your Comparison of the Sphere and Conocides, so far holds good, as to prove that the Superficies of the Conoeides is greater then the Superficies of the Cone described by the subtense of the Parabolicall, Hyperbolicall, or Ellipticall Line. But when I come to say that The cause of the excess of the Superficies of the Portion of the Sphere above the Superficies of the Cone, confisis in the Angle-DAB, and the cause of the excess of the Circle made upon the Tangent AD above the Superficies of the same Cone, consists in the magnitude of the same Angle DAB, how will you apply this to your Con-...? For suppose that the crooked Line AB (in the seventh Figure) were not an Arch of a Circle, do you think that the Angles which it maketh with the Subtense AB, at the Points A and B must needs be equall? Or if they be not, does the excess of the Superficies of the Circle upon AD above the Superficies of the Cone, or the exceis of the Superfici-s of the Portion of the Conoeides above the Superficies of the same Cone consist in the Angle DAB, o- rather in the -...tude of the two unequall Angles DAB, and ABA? You should have drawn some other crooked Line, and made Tangents to it through A and B, and you would presently have seen your error. See how you can answer this; for if this Demonstration of minestand firm, I may be bold to say, though the same be well Demonstrated by Ar-..., that this way of mine is more naturall, as proceeding immediately from the naturall efficient causes of the effect contained in the conclusion; and besides, more brief and more easie to be followed by the fancy of the Reader.

To the fourteenth Article you say that I commit a Circle in that I require in the fourth Article the finding of two mean Proportionals, and come not till now to show how it is to be done. Nor now neither. But in the mean time you commit two mistakes in saying so. The place cited by you in the fourth Article is (in the Latine) Pag. 149. Lin 9. (in the English) Pag. 188. Lin. 3. Let any Reader judge whether that be a requiring it, or a supposing it to be

done; this is your first mistake. The second is, that in this place the Proposition itself, which is, If those Deficient Figures could be described in a Parallel-gram exquisitely, there might be found thereby between any two Lines given, as many mean Proportionals as one would, is a Theoreme, upon supposition of these crooked Lines exquisitely drawn; but you take it for a Probleme.

And proceeding in that error, you undertake the invention of two mean Proportionals, using therein my first Figure, which is of the same construction with the eighth that belongeth to this fourteenth Article. Your construction is, Let there be taken in the Diameter CA (Figure 1) the two given Lines, or two others Proportionall to them, as CH, CG, and their —nate Lines HF, GE (which by construction are in subtriplicate Proportion of the intercepted Diameters.) These Lines will shew the Proportions which those four Proportionals are to. But how will you find the Length of HF or GE, the ordinate Lines? Will you not do it by so drawing the crooked Line CFE as it may pass through both the Points F and E? You may make it pass through one of them, but to make it pass through the other, you must finde two mean Proportionals between GK and GL, or between HI and HP; Which you cannot do, unless the crooked Line be exactly drawn; which it cannot be by the Geometry of Planes. Go show this Demonstration of yours to Orontius, and see what he will say to it.

I am now come to an end of your objections to the seventeenth Chapter, where you have an Epiphonema not to be passed over in silence. But because you pretend to the Demonstration of some of these Propositions by another Method in your Arithmetica Infinitorum, I shall first try whether you be able to defend those Demonstrations as well as I have done theie of mine by the Method of Motion.

The first Proposition of your Arithmetica Infinitorum is this Lemma. In a Series (or Row) of Quantities Arithmetically Proportionall, beginning at a

Poi-t or Cyp — r as 0, 1, 2, 3, 4, &c. to finde the Proportion of the Aggregate of them all, to the Aggregate of so many times the greatest, as there are Terms. This is to be done by multiplying the greatest into half the Number of the Terms. The Demonstration is easie. But how do you demonstrate the same? The most simple way (say you) of finding this and some other Problemes, it to do the thing it self a little way, and to observe and compare the appearing Proportions, and then by Induction, to conclude it universally. Egregious Logicians and Geometricians, that think an Induction without a Numeration of all the particulars sufficient to infer a Conclusion universall, and fit to be received for a Geometricall Demonstration! But why do you limit it to the naturall consequence of the Numbers, 0, 1, 2, 3, 4, &c? Is it not also true in these Numbers, 0, 2, 4, 6, &c. or in these, 0, 7, 14, 21, &c? Or in any Numbers where the Difference of nothing and the first Number is equall to the difference between the first and second, and between the second and third &c? Again, are not these Quantities 1, 3, 5, 7, &c. in continuall Proportion Arithmetically? And if you put before them a Cypher thus, 0, 1, 3, 5, 7, do you think that the sum of them is equall to the half of five times seven? Therefore though your Lemma be true, and by me (Cha. Art. 5.) demonstrated; yet you did not know why it is true; which also appears most evidently in the first Proposition of your Conique-sections. Where first you have this, That a Parallelogram whose Altitude is infinitely little, that is to say, none, is scarce any thing else but a Line. Is this the Language of Geometry? How do you determine this word scarce? The least Altitude, is Somewhat or Nothing. If Somewhat, then the first character of your Arithmetical Progression must not be a cypher; and consequently the first eighteen Propositions of this y-ur Arithmetica Infinitorum are all naught. If Nothing, then your whole figure is without Altitude, and consequently your Understanding naught. Again, in the same Proposition, you say thus, We

will sometimes call those Parallelograms rather by the name of Lines than of Parallelograms, at least, when there is no consideration of a determinate Altitude; But where there is a consideration of a determinate Altitude (which will happen sometimes) there that little Altitude shall be so far considered, as that being infinitely multiplyed it may be equall to the Altitude of the whole Figure. See here in what a confusion you are when you resist the truth. When you consider no determinate Altitude (that is, no Quantity of Altitude) then you say your Parallelogram shall be called a Line. But when the Altitude is determined (that is, when it is Quantity) then you will call it a Parallelogram. Is not this the very same doctrine which you so much wonder at and reprehend in me, in your objections to my eighth Chapter, and your word considered used as I used it? 'Tis very ugly in one that so bitterly reprehendeth a doctrine in another, to be driven upon the same himself by the force of truth when he thinks not on't. Again, seeing you admit in any case, those infinitely little altitudes to be quantity, what need you this limitation of yours, so far forth as that by multiplication they may be made equall to the Altitude of the whole figure? May not the half, the third, the fourth, or the firth part, &c. be made equall to the whole by multiplication? Why could you not have said plainly, so far forth as that every one of those infinitely little Altitudes be not only something but an aliquo-part of the whol-?-o you will have an infinitely little Altitude, that is to say a Point, to be both nothing and something and an aliquot part. And all this proceeds from not understanding the ground of your Profession.

Well, the Lemma is true. Let us see the Theoremes you draw from it. The first is (Pag. 3.) that a Triangle to a Parallelogram of equall Base and Altitude is as one to two. The conclusion is true, but how know you that? Because (say you) the Triangle consists as it were (as is were, is no Phrase of a Geometrician) of an Infinite Number of stra-ght Parallel Lines. Does it so? Then by your own doctrine, which is, that Lines have no breadth, the

Altitude of your Triangle consisteth of an infinite Number of no Altitudes, that is of an infinite Number of Nothings, and consequently the Area of your Triangle has no Quantity. If you say that by the Parallels you mean infinitely little Parallelograms, you are never the better; for if infinitely little, either they are nothing, or if somewha-, yet seeing that no two sides of a Triangle are Parallel, those Parallels cannot be Parallelograms. I see they may be counted for Parallelograms by not considering the Quantity of their Altitudes in the Demonstration. But you are barred of that Plea, by your spitefull arguing against it in your Elenchus. Therefore this third Proposition, and with it the fourth is undemonstrated.

Your fifth Proposition is, The Spirall Line is equall to half the Circle of the first Revolution. But what Spirall Line? We shall understand that by your construction, which is this, The straight Line MA, (in your Figure which I have placed at the end of the fifth Lesson) turned round (the Point M remaining unmoved) is supposed to describe with its Point A the Circle AOA, whilst some Point (in the same MA whilst it goes about) is supposed to be moved uniformly from M to A describing the Spirall Line. This therefore is the Spirall Line of Archimedes; and your Proposition affirms it to be equall to the half of the Circle AOA; which you perceived not long after to be false. But thinking it had been true, you go about to prove it, by inscribing in the Circle an infinite multitude of equall Angles, and consequently an infinite Number of Sectors, whose Arches will therefore be in Arithmetically Proportion; Which is true. And the Aggregate of those Arches equall to half the Circumference AOA; Which is true also. And thence you conclude that the Spirall Line is equall to half the Circumference of the Circle AOA; Which is false. For the Aggregate of that infinite Number of infinitely little Arches, is not the Spirall Line made by your construction, seeing by your construction the Line you make is manifestly the Spiral of Archimedes; whereas no Number (though infinite) of Arches

of Circles (how little soever) is any kind of Spirall at all; and though you call it a Spirall, that is but a patch to cover your fault, and deceiveth no man but your self. Besides, you saw not how absurd it was (for you that hold a Point to be absolutely nothing) to make an infinite Number of equall Angles (the Radius increasing as the Number of Angles increaseth) and then to say that the Arches of the Sectors whose Angles they are, are as 0, 1, 2, 3, 4, &c. For you make the first Angle 0, and all the rest equall to it; and so make 0, 0, 0, 0, 0, &c. to be the same Progression with 0, 1, 2, 3, 4, &c. The influence of this absurdity reacheth to the end of the eighteenth Proposition. So many are therefore false, or nothing worth. And you needed not to wonder that the Doctrine contained in them was omitted by Archimedes, who never was so senseless as to think a Spi — ll Line was compounded of Arches of Circles.

Your nineteenth Proposition is this other Lemma, In a Series (or a Row) of Quantities, beginning from a Point, or Cypher, and proceeding according to the order of the square Numbers, as 0, 1, 4, 9, 16, &c. to finde what Proportion the whole Series hath to so many times the greatest. And you conclude the Proportion to be that of 1 to 3. Which is false, as you shall presently see. First, let the Series of Squares with the prefixed Cypher, and under every one of them, the greatest 4 be And you have for the sum of the Squares 5, and for thrice the greatest 12, the third part whereof is 4. But 5 is greater then 4, by 1, that is, by one twelfth of 12; which Quantity is somewhat, let it be called A. Again, let the Row of Squares be lengthened one term surther, and the greatest set under every one of them as The sum of the Squares is 14, and the sum of four times the greatest is 36, whereof the third part is 12. But 14 is greater then 12 by two unities, that is, by two twelfths of 12, that is, by 2 A. The difference therefore between the sum of the Squares, and the sum of so many times the greatest Square is greater, when the cypher is followed by three Squares, then when by but two.

Again, let the Row have five terms as in these Numbers with the greatest five times subscribed, and the sum of the Squares will be 30, the sum of all the greatest will be 80. The third part whereof is $26\frac{2}{3}$. But 30 is greater then $26\frac{1}{3}$ by $3\frac{1}{3}$, that is, by three twelfths of twelve and $\frac{1}{3}$ of a twelfth, that is, by $3\frac{1}{3}$ A. Likewise in the Series continued to six places with the greatest six times subscribed, as the sum of the Squares is 55, and the sum of the greatest six times taken is 150, the third part whereof is 50. But 55 is greater then 50 by 5, that is, by five twelfths of 12, that is, by 5. A. And so continually as the Row groweth longer, the excess also of the aggregate of the Squares above the third part of the aggregate of so many times the greatest Square, groweth greater. And consequently if the Number of the Squares were infinite, their sum would be so far from being equal to the third part of the aggregate of the greatest as often taken, as that it would be greater then it by a Quantity greater then any that can be given or named.

That which deceived you was partly this, that you think (as you do in your Elenchus) that these Fractions &c. are Proportions, as if $1/12$ were the Proportion of one to twelve, and consequently $2/12$ double the Proportion of one to twelve; which is as unintelligible as School-Divinity; and I assure you, far from the meaning of Mr. Oughtred in the sixth Chapter of his *Clavis Mathematicae*, where he sayes that $43/7$ is the Proportion of 31 to 7; for his meaning is, that the Proportion of $43/7$ to one, is the Proportion of 31 to 7; whereas if he meant as you do, then $86/7$ should be double the Proportion of 31 to 7. Partly also because you think (as in the end of the twentieth Proposition) that if the Proportion of the Numerators of these Fractions to their Denominators decrease eternally, they shall so vanish at last as to leave the Proportion of the sum of all the Squares to the sum of the greatest so often taken, (that is, an infinite Number of times) as one to three, or the sum of the greatest to the sum of the increasing Squares, as three to one; for which there is no more reason then for four to one, or five to one,

or any other such Proportion. For if the Proportions come eternally nearer and nearer to the subtriple, they must needs also come nearer and nearer to subquadruple; and you may as well conclude thence that the upper Quantities shall be to the Lower Quantities as one to four, or as one to five, &c. as conclude they are as one to three. You can see without admonition, what effect this false ground of yours will produce in the whole structure of your *Arithmetica Infinitorum*; and how it makes all that you have said unto the end of your thirty-eighth Proposition, undemonstrated, and much of it false.

The thirty-ninth is this other Lemma, In a Series of Quantities beginning with a Point or Cypher, and proceeding according to the Series of the Cubique Numbers, as 0. 1. 8. 27. 64, &c. to finde the Proportion of the sum of the Cubes to the sum of the greatest Cube, so many times taken as there be Terms, And you conclude that they have the Proportion of 1 to 4; which is false.

Let the first Series be of three terms subscribed with the greatest ; the sum of the Cubes is nine; the sum of all the greatest is 24; a quarter whereof is 6. But 9 is greater then 6 by three unities. An unity is something. Let it be therefore A. Therefore the Row of Cubes is greater then a quarter of three times eight, by three A. Again, let the Series have four terms, as ; the sum of the Cubes is 36; a quarter of the sum of all the greatest is twenty-seven. But thirty-six is greater then twenty-seven by nine- that is, by 9 A. The excess therefore of the sum of the Cubes above the fourth part of the sum of all the greatest, is increased by the increase of the Number of terms. Again, let the terms be five as the sum of the Cubes is one hundred; the sum of all the greatest three hundred and twenty; a quarter whereof is eighty. But one hundred is greater then eighty by twenty, that is, by 20 A. So you see that this Lemma also is false. And yet there is grounded upon it all that which you have of comparing Parabolas and Paraboloeides with the

Parallelograms wherein they are accommodated. And therefore though it be true, that the Parabola is $\frac{2}{3}$, and the Cubicall Paraboloeides $\frac{3}{4}$ of their Parallelograms respectively' yet it is more then you were certain of when you referred (me for the learning of Geometry) to this Book of yours. Besides, any man may perceive that without these two Lemmas (which are mingled with all your compounded Series with their excesses) there is nothing demonstrated to the end of your Book. Which to prosecute particularly, were but a vain expence of time. Truly were it not that I must defend my reputation, I should not have shewed the world how little there is of sound Doctrine in any of your Books. For when I think how dejected you will be for the future, and how the grief of so much time irrecoverably lost, together with the conscience of taking so great a stipend, for mis-teaching the young men of the University, & the consideration of how much your friends will be ashamed of you, will accompany you for the rest of your life, I have more compassion for you then you have deserved. Your Treatise of the Angle of Contact, I have before confuted in a very few leaves. And for that of your Conique Sections, it is so covered over with the scab of Symboles that I had not the patience to examine whether it be well or ill demonstrated.

Yet I observed thus much, that you find a Tangent to a Point given in the Section, by a Diameter given; and in the next Chapter after, you teach the finding of a Diameter, which is not artificially done.

I observe also, that you call the Parameter an Imaginary Line, as if the place thereof were less determined then the Diameter it self; and then you take a mean Proportionall between the intercepted Diameter, and its contiguous ordinate Line to find it. And tis true, you find it- But the Parameter has a determined Quantity to be found without taking a mean Proportional. For the Diameter and half the Section being given, draw a Tangent through the Vertex, and dividing the Angle in the midst which is

made by the Diameter and Tangent, the Line that so divideth the Angle, will cut the crooked Line. From intersection draw a Line (if it be a Parabola) Parallel to the Diameter, and that Line shall cut off in the Tangent from the Vertex the Parameter sought. But if the Section be an E-lipsis, or an Hyperbole, you may use the same Method, saving that the Line drawn from the intersection must not be Parallel, but must pass through the end of the transverse Diameter, and then also it shall cut off a part of the Tangent, which measured from the Vertex is the Parameter. So that there is no more reason to call the Parameter an Imaginary Line then the Diameter.

Lastly, I observe that in all this your new Method of Coniques you shew not how to find the Burning Points, which writers call the Foci and Umbilici of the Section, which are of all other things belonging to the Coniques most usefull in Philosophy. Why therefore were they not as worthy of your pains as the rest, for the rest also have already been demonstrated by others? You know the Focus of the Parabola is in the Axis distant from the Vertex a quarter of the Parameter. Know also that the Focus of an Hyperbole, is in the Axis, distant from the Vertex, as much as the Hypotenusall of a rectangled Triangle, whose one side is half the transverse Axis, the other side half the mean Proportionall between the whole transverse Axis and the Parameter, is greater then half the transverse Axis.

The cause why you have performed nothing in any of your Books (saving that in your Elen-...hus you have spied a few negligences of mine, which I need not be ashamed of) is this, that you understood not what is Quantity; Line, Super-...ies, Angle, and Proportion; without which you cannot have the Science of any one Proposition in Geometry. From this one and first Definition of Euclise, a Point is th — whereof there is no p — t, understood by Sextus Empiricus, as you understand it, that is to say, misunderstood, Sextus Empiricus hath utterly destroyed most of the rest, and Demonstrated, that in Geometry there is no Science, and by that means you

have betrayed the most evident of the Sciences to the Sceptiques. But as I understand it for that whereof no part is reckoned, his Arguments have no force at all, and Geometry is redeemed. If a Line have no Latitude, how shall a Cylinder rowling on a Plain, which it toucheth not but in a Line, describe a Superficies? How can you affirm that any of those things can be without Quantity, whereof the one may be greater or less then the other? But in the common Contact of divers Circles the externall Circle maketh with the common Tangent a less Angle of Contact then the internall. Why then is it not Quantity? An Angle is made by the concurrence of two Lines from severall Regions, concurring (by their generation) in one and the same Point. How then can you say the Angle of Contact is no Angle? One measure cannot be applicable at once to the Angle of Contact, and Angle of Conversion. How then can you infer, if they be both Angles, that they must be Homogeneous? Proportion is the Relation of two Quantities. How then can a Quotient or Fraction, which is Quantity absolute, be a Proportion? But to come at last to your Ephiphonema, wherein, though I have perfectly demonstrated all those Propositions concerning the Proportion of Parabolasters to their Parallelog-ams, and you have demonstrated none of them (as you cannot now but plainly see) but committed most Paralogisms, How could you be so transported with pride, as insolently to compare the setting of them forth as mine, to the Act of him that steals a horse, and comes to the gallows for it. You have read, I think, of the gallows set up by Haman. Remember therefore also who was hanged upon it.

After your dejection I shall comfort you a little, a very little, with this, that whereas this 18 Chapter containeth two Problems, one, the finding of a straight Line equall to the -rooked Line of a Semiparabola, The other, the finding of straight Lines equall to the crooked Lines of the Parabolasters in the table of the third Article of the 17 Chapter; You have -...uly demonstrated that they are both false; and another hath also Demonstrated

the same another way. Nevertheless the fault was not in my method, but in a mistake of one Line for another, and such as was not hard to correct; and is now so corrected in the English as you shall not be able (if you can sufficiently imagine Motions) to reprehend. The fault was this, That in the Triangles which have the same. Base and Altitude with the Parabola and Parabolaster, I take for designation of the mean uniform Impetus, a mean Proportionall (in the first Figure) between the whole Diameter and its half, and (in the second Figure) a mean Proportionall between the whole Diameter and its third part; which was manifestly false, and contrary to what I had shewn in the 16 Chapter. Whereas I ought to have taken the half of the Base, as now I have done, and thereby exhibited the Straight Lines equall to those crooked Lines, as I undertook to do. Which error therefore proceeded not from want of skill, but from want of care; and what I promised (as bold as you say the promise was,) I have now performed.

The rest of your exceptions to this Chapter, are to these words in the end, there be some that say, that though there be equality between a straight and crooked Line, yet now, (they say) after the full of Adam, it cannot be found without the especiall help of divine grace. And you say you think there be none that say so. I am not bound to tell you who they are. Nevertheless, that other men may see the Spirit of an ambitious part of the Clergy, I will tell you where I read it. It is in the Prolegomena of Lalovera (a Jesuite) to his Quadrature of the Circle, pag. 13 & 14, in these wor-s, *Quamvis circuli tetragonismus fitpossibilis, an taman etiam sit, hoc est, post Adae lapsum homo ejus scientiam abs{que} speciali di-inae gratiae auxilio, possit comparare, jure merito inquirunt Theologi, pronunciant{que} hanc veritatem tanta esse caligine involutam ut illam videre nemo possit, nisi Ignorantiae ex primi parentis praevaricatione propagatas tenebras indebitus divina lucis radius dissipet; quod verissimum esse sentio.* Wherein I observed that he (supposing he had found that Quadrature) would have us

believe it was not by the ordinary and Naturall help of God (whereby one man reasoneth, judgeth and remembreth better then another) but by a Special (which must be a Superturall) help of God, that he hath given to him of the order of Jesus above others that have attempted the same in vain. Insinuating thereby, as handsomely as he could, a Speciall love of God towards the Jesuites. But you taking no notice of the word Speciall, would have men think I held, that humane Sciences might be acquired without any help of God. And thereupon proceed in a great deal of ill language to the end of your objections to this Chapter. But I shall take notice of your Manners for altogether in my next Lesson.

At the nineteenth Chapter you see not (you say) the Method. Like enough. In this Chapter I consider not the Cause of Reflection, which consisteth in the resistance of Bodies naturall; but I consider the consequences, arising from the supposition of the equality of the Angle of Reflection, to that of Incidence; leaving the causes both of Reflection, and of Refraction to be handled together in the 24 Chapter. Which Method (think what you will) I still think best.

Secondly, you say I define not here, but many Chapters after, what an Angle of Incidence, and what an Angle of Reflection is. Had you not been more hasty then diligent Readers, you had found that those Definitions of the Angle of Incidence, and of Reflection were here set down in the first Article, and not deferred to the 24. Let not therefore your own oversight be any more brought in for an objection.

Thirdly, you say there is no great difficulty in the business of this Chapter. It may be so, now 'tis down; but before it was done, I doubt not but you that are a Professor would have done the same, as well as you have done that of the Angle of Contact, or the business of your Arithmetica Infinitorum. But what a novice in Geometry would have done I cannot tell.

To the third, fourth, and fifth Article, you object a want of Determination; and shew it by instance, as to the third Article. But what those Determinations should be, you determine not, because you could not. The words in the third Article, are first these, If there fall two straight Lines Parallel, &c. which is too generall. It should be, if there fall the same way two straight Lines Parallel, &c. Next these, their Reflected Lines produced inwards shall make an Angle, &c. This also is too generall. I should have said their Reflected Lines produced inwards, if they meet within, shall make an Angle, &c. Which done, both this Article and the 4 and 5 are fully demonstrated. And without it, an intelligent Reader had been satisfied, supplying the want himself by the construction.

To the eight, you object onely the two great Length, and labour of it, because you can do it a shorter way. Perhaps so now, as being easie to shorten many of the Demonstrations both of Euclide, and other the best Geometricians that are or have been. And this is all you had to say to my 19 Chapter. Before I proceed, I must put you in mind that these words of yours, *Adducis malleum, ut occi-as muscam*, are not good Latine, *Malleum* affers, *Malleum adhi-es*, *Malleo uteris*, are good. When you speak of bringing Bodies animate, *Ducere* and *Adduc-re* are good, for there to bring, is to gu — e or lea-. And of Bodies inanimate *Adducere* is good for *Attra-ere*, which is to draw to. But when you bring a hammer, will you say *Adduco Malleum*, I lead a hammer? A man may lead another man, and a ninny may be said to lead another ninny, but not a hammer. Neverthelese, I should not have thought fit to reprehend this fault upon this occasion in an English man, nor to take notice of it, but that I finde you in some places nibling (but causelessly) at my Latine.

Concerning the twentieth Chapter, before I answer to the objections against the Propositions themselves, I must answer to the exception you first take to these words of mine, *Quae de dimensione Circuli & Angulorum*

pronuntiata sunt tanquam exacté inventa, accipiat Lector — nquam dicta Problematicæ. To which you say thus, we are wont in Geometry to call some Propositions Theorem-s, other's Problems, &c. of which Theoreme is that wherein some assertion is propounded to be proved, a Problem that wherein something is commanded to be done. Do you mean to be done, and not proved? By your favour, a Probleme in all ancient writers signifies no more but a Proposition uttered, to the end to have it by them to whom it is uttered, examined whether it be true or not true, fai-able or not faisable; and differs not amongst Geometricians from a Theoreme, but in the manner of Propounding. For this Proposition, To make an equilaterall Triangle, so propounded they call a Problem. But if propounded thus, If upon the ends of a straight Line given be described two Circles, whose Radius is the same straight Line, and there be drawn from the intersection of the Circles to their two Centers, two straight Lines, there will be made an equilateral Triangle, then they call it a Theoreme; and yet the Proposition is the same. Therefore these words Accipiat Lector tanquam dicta Problematicæ, signifie plainly this, that I would have the Reader, take for propounded to him to examine, whether from my construction the Quadrature of the Circle can be truly inferred or not; and this is not to bid him (as you interpret it) to square the Circle. And if you believe that Problematicæ signifies probably, you have been very negligent in observing the sense of the ancient Greek Philosophers in the word Probleme. Therefore your Solemus in Geometria, &c. is nothing to the purpose; nor had it been though you had spoken more properly, and said Sol-nt, leaving out your selves.

My first Article hath this Title, from a False supposition, a false Quadrature of the Circle. Seeing therefore you were resolved to shew where I erred, you should have proved either that the Supposition was true, and the Conclusion falsely inferred, or contrarily that though the Supposition be false, yet the Conclusion is true; for else you object nothing to my

Geometry, but only to my Judgement, in thinking fit to publish it; which nevertheless you cannot justly do, seeing it was likely to give occasion to ingenuous men (they practise of it being so accurate to sense) to inquire wherein the Fallacy did consist. And for the Probleme as it was first printed, but never published, and consequently ought to have passed for a private paper stoln out of my study, your publique objecting against it, (in the opinion of all men that have conversed so much with honest company as to know what belongs to civill conversation,) was sufficiently barbarous in Divines. And seeing you knew I had rejected that Proposition, it was but a poor Ambition to take wing as you thought to do, like Beetles from my egestions. But let that be as it will, you will think strange now I should resume, and make good (at least against your objection) that very same Proposition. So much of the Figure as is needfull you will finde noted with the same letters, and placed at the end of this 5 Lesson. Wherein let B I, be an Arch not greater then the Radius of the Circle, and divided into four equall parts, in L, N, O. Draw S N, the Sine of the Arch B N, and produce it to T, so as S T be double to S N, that is, equall to the Chord B I. Draw likewise a L, the Sine of the Arch B L, and produce it to c, so as a c be quadruple to a L, that is, equall to the two Chords B N, N I. Upon the Center N with the Radius N I, draw the A-rch I d, cutting B U the Tangent in d. Then will B N produced cut the Arch I d, in the midst at o. In the Line B S produced take S b, equall to B S; then draw and produce b N, and it will fall on the Point d. And B d, S T, will be equall; and d T joyned and produced will fall upon o, the midst of the Arch I d. Joyn I T, and produce it to the Tangent B U in U. I say, that the st-aight Line I T U shall pass through c. For seeing B S, S h, are equall, and the Angle at S a right Angle, the straight Lines B N, and b N, are also equall, and the Triangles B N b, d N o like and equall; and the Lines d T, T o equall. Draw o i Parallel to d U, cutting I U in i; and the Triangles d T v, o T i will also be like and equal.

Produce ST to the Arch doI in e , and produce it further to f , so that the Line ef be equall to Tc ; and then Sf will be equall to ac . Therefore fc joyned will be Parallel to BS . In cf produced take fg equall to cf ; and draw gm Parallel to dU , cutting IU in m , and do in n ; and let the intersection of the two Lines ac and do be in r ; which being done, the Triangles mT , rcT will be like and equall. Therefore mn and rc are equall; and -... sequently the straight Line $ImTU$ shall pass through c . Dividing therefore ac in the midst at t , and SN in the midst at l , and joyning tN , Ll , the Lines Ll , tN , and cT produced with all meet in one and the same Point of BS produced; suppose at q . Therefore the Point q being given by the two known Points T and I , the Lines drawn from q through equall parts of the Sine of the Arch BI , for example through the Points P , Q , R , of the Sine MI , shall cut off equall Arches, as BL , LN , NO , OI . And this is enough to make good that Probleme, as to your objection.

The straight Line therefore BU for any thing you have said is p-oved equall to the Arch BI , and the division of any Angle given into any proportion given, the Quadrature of any Sector, and the Construction of any equilaterall P -lygon is also given. And though in this also I should have erred, yet it cannot be denyed but that I have used a more natural, a more Geometrical, and a more pe-spicious method in the search of this so difficult a Probleme, then you have done in your *Arithmetica Infinitorum*. For though it be true that the aggregate of all the mean Proportionals between the Radius together with an infinitely little part of the same, and the Radius wanting an infinitely little part of the same; and again, between the Radius, together with two infinitely little parts, and the Radius wanting two infinitely little parts, and so on eternally will be equall to the Quadrant (a thing which every mean Geometrician knew before) yet it was absurd to think those Means could be calculated in Numbers by Interpoling of a Symbole; especially when you make that Symbole to stand for a Numbet

neither true nor surd; as if there were a number that could neither be uttered in words, nor not be uttered in words. For what else is surd, but that which cannot be spoken?

To the fifth Article (though your discourse be long) you object but two things. One is, that Whereas the Spirall of Archimedes is made of two Motions, one straight, the other circular, both uniform, I taking the Motion compounded of them both for one of those that are compounded, conclude falsely, that the generation of the Spirall is like to the generation of the Parabola. What heed you use to take in your reprehensions, appears most manifestly in this objection. For I say in that demonstration of mine that the velocity of the point A in describing the Spirall, increaseth continually in Proportion to the Times. For seeing it goes on uniformly in the Semidiameter, it is impossible it should not pass into greater and greater Circles proportionally to the Times; and consequently it must have a swifter and swifter Motion circular, to be compounded with the uniform Motion in every Point of the Radius as it turneth about. This objection therefore is nothing but an effect of a Will (without cause) to contradict.

The other objection is that Granting all to be true hitherto, yet because it depends upon the finding of a straight Line equall to a Parabolicall Line in the 18 Chapter where I was deceived, I am also deceived here. True. But because in the 18 Chapter of this English Edition I have found a straight Line equall to a Parabolicall Line, I have also found a straight Line equall to the Spirall Line of Archimedes — so. I must here put you in minde that by these words in your objections to the fifth Article at your Number 2, Quatenus verum est, &c. we have demonstrated Prop. 11, 13. Arithmet. Infin. you make it appear that you thought your Spirall (made of Archimedes Circles) was the true Spirall of Archimedes; which is fully as absurd as the Quadrature of Joseph Scaliger, whose Geometry you so much despise.

To the sixth Article which is a Digression concerning the Analytiques of Geomet-icia-s, you deny that the Efficient cause of the Construction ought to be contained in the Demonstration. As if any Probleme could be known to be truly done, otherwise then by knowing first how, that is to say, by what Efficient Cause, and in what manner it is to be done. Whatsoever is done without that knowledge, cannot be demonstrated to be done; as you see in your computation of the Parabola, and Parabolocides, in your Arithmetica Infinitorum.

And whereas I said that The ends of all straight Lines drawn from a straight Line, and passing through one and the same Point, if their parts be Proportionall, shall be in a-...aight Line; is true and accurate; as also If they begin in the Circumference of a Cir-le, they also be in the Cir-umference of another Circle. And so is this, If the Proportion be duplicate, they shall be in a Parabola. All this I say is true and accurately spoken. But this was no place for the demonstration of it. Others have done it. And I perceive by that you put in by Parenthesis (intelligi- credo inter -du-s Peripheri — concentric-s) that you understand not what I mean.

Hitherto reach your objections to my Geometry. For the rest of your Book, it containeth nothing but a collection of lies, wherewith you do what you can, to extenuate as vulgar, and disgrace as false, that which followeth, and to which you have made no speciall objection.

I shall therefore only add in this place concerning your Analytica per Potestates, that it is no Art. For the Rule, both in Mr. Oughtred, and in Des Cartes is this, When a Probleme or Question is propounded, suppose the thing required done, and then using a fit ratiocination, put A or some other vowell for the magnitude sought. How is a man the better for this Rule without another rule, How to know when the ratiocination is fit? There may therefore be in this kind of Analysis more or less naturall prudence, according as the Analyst is more or less wis-, or as one man in chusing of

the unknown Quantity with which he will begin, or in chusing the way of the consequences which he will draw from the Hypothesis, may have better luck then another. But this is nothing to Art. A man may sometimes spend a whole day in deriving of consequences in vain, and perhaps another time solve the same Probleme in a few minutes.

I shall also add, that Symboles though they shorten the writing, yet they do not make the Reader understand it soon-r then if it were written in words. For the conception of the Lines and Figures (without which a man learneth nothing) must proceed from words, either spoken or thought upon. So that there is a double labour of the mind, one to reduce your Symboles to words (which are also Symboles) another to attend to the Ideas which they signifie. Besides, if you but consider how none of the Antients ever used any of them in their published demonstrations of Geometry, nor in their Books of Arithmetique, more then for the Rootes and Potestates themselves; and how bad success you have had your self in the unskilfull using of them, you will not, I think, for the future be so much in love with them as to demonstrate by them that first part you promise of your Opera Mathe-atica. In which if you make not amends for that which you have already published, you will much disgrace those Mathematicians you address your Epistles to, or otherwise have commended; as also the Universities (as to this kinde of Learning) in the sight of learned men beyond Sea. And thus having examined your panier of Mathematiques, and finding in it no knowledge neither of Quantity, nor of measure, nor of Proportion, nor of Time, nor of Motion, nor of any thing, but only of certain Characters, as if a Hen had been scraping there; I take out my hand again, to put it in to your other panier of Theology, and good Manners. In the mean time I will trust the objections made by you the Astronomer (wherein there is neither close reasoning, nor good stile, nor sharpness of wit, to impose upon any man) to the discretion of all sorts of Readers.

**OF MANNERS. TO THE SAME EGREGIOUS
PROFESSORS OF THE MATHEMATICKS IN THE
UNIVERSITY OF OXFORD. LESSON VI.**

HAVING IN THE precedent Lessons maintained the Truth of my Geometry, and sufficiently made appear, that your objections against it are but so many errors of your own, proceeding from misunderstanding of the Porpositions you have read in Euclide, and other Masters of Geometry; I leave it to your consideration to whom belong (according to your own sentence) the unhandsome attributes you so often give me upon supposition, that you your selves are in the right, and I mistaken; and come now to purge my self of those greater accusations which concern my Manners. It cannot be expected there should be much Science of any kinde in a man that wanteth Judgement; nor Judgement in a man that knoweth not the Manners due to a publique disputation in writing; wherein the scope of either party ought to be no other then the examination and manifestation of the truth. For whatsoever is added of contumely, either directly, or scommatically, is want of Charity, and uncivil; unless it be done by way of Reddition from him that is first provoked to it. I say unless it be by way of Reddition; for so was the Judgement given by the Emperor Vespasian in a quarrell between a Senato: and a Knight of Rome which had given him ill language. For when the Knight had proved, that the first ill language proceeded from the Senator, the Emperor acquitted him in these words *Maledici senctoribus non oportere; remal-dicere, fas & civtle esse*. Nevertheless, now a dayes uncivill words are commonly and bitterly used by all that write in matter of Controversie, especially in Divinity, excepting now and then such writers as

have been more then ordinarily well bred, and have observed, how hainous, and ha-ardous a thing such c-ntumely is amongst some sorts of men, whether that which is said in disgrace be true or false. For evill words by all men of understanding are taken for a defiance, and a challenge to open war. But that you should have bserved so much, who are yet in your mothers belly, was not a thing to be much expected.

The faults in Manners you lay to my charge, are these, 1. Self conceit. 2. That I will be very angry with all men that do not presently submit to my Dictates. 3. That I had my Doctrine concerning Vision, out of papers which I had in my hands of Mr. Warners. 4. That I have injured the Universities. 5. That I am an Enemy to Religion. These are great faults; but such as I cannot yet confess. And therefore I must as well as I can, seek out the grounds upon which you build your Accusation. Which grounds (seeing you are not acquainted with my conve-sation) must be either in my published writings, or reported to you by honest men, and without suspicion of interest in reporting it. As for my self-conceit and ostentation, you shall finde no such matter in my writings That which you alleadge from thence is first that in the Epistle Dedicatory I say of my Book de Corpore, Though it be little, yet it is full; and if good may go for great, great enough. When a man presenting a gift great or small to his betters, adorneth it the best he can to make it the more acceptable; he that thinks this to be Ostentation, and self-conceit, is little versed in the common actions of humane life. And in the same Epistle where I say of Civill Philosophy, it is no antienter then my Book de Cive, these words are added, I say it provoked, and that my detractors may see they lose their labour. But that which is truly said, and upon provocation, is not boasting, but defence. A short sum of that Book of mine, now publiquely in French, done by a Gentleman I never saw, carrieth the Title of Ethiques demonstrated. The Book it self translated into French hath not onely a great testimony from the Translator Serberius, but also

from Gassendus, and Mersennus, who being both of the Roman Religion had no cause to praise it, or the Divines of England have no cause to finde fault with it. Besides, you know that the Doctrine therein contained is generally received by all but those of the Clergy, who think their interest concerned in being made subordinate to the Civil Powe-; whose testimonies therefore are invalide. Why therefore if I commend it also against them that dispraise it publiquely, do you call it boasting? You have heard (you say) that I had promised the Quadrature of the Circle, &c. You heard then that which was not true. I have been asked sometimes, by such as saw the Figure before me, what I was doing, and I was not a-...aid to say I was seeking for the solution of that Probleme; but not that I had done it. And afterwards being asked of the success, I have said, I thought it done. This is not boasting; and yet it was enough, when told again, to make a fool believe 'twas boasting. But you the Astronomer in the Epistle before your Philosophicall Essay, say you had a great expectation of my Philosophicall, and Mathematicall works; before they were published. It may be so. Is that my fault? can a man raise a great expectation of himself by boasting? If he could, neither of you would be long before you raised it of your selves; saving that what you have already published, has made it now too late. For I verily believe there was never seen worse reasoning then in that Philosophicall Essay; which any judicious Reader would believe proceeded from a Praevaricator, rather then from a man that believed himself; nor worse Principles, then those in your Books of Geometry. The expectation of that which should be written by me, was raised partly by the Cogitata Physico-Mathematica of Mersennus, wherein I am often named with honour; and partly by others with whom I then conversed in Paris, without any ostentation. That no man has a great expectation of any thing that shall proceed from either of you two, I am content to let it be your praise.

Another Argument of my self-conceit, you take from my contempt of the writers of Metaphysiques and School-Divinity. If that be a sign of self-conceit, I must confess I am guilty; and if your Geometry had then been published, I had contemned that as much. But yet I cannot see the consequence (unless you lend me your better Logique) from despising insignificant and absurd language to self-conceit.

And again, in your *Vindiciae Academicarum*, you put for boasting, that in my *Leviathan* Pag. 180. I would have that Book by entire Sovereignty imposed upon the Universities; and in my *Review* Pag. 395. That I say of my *Leviathan*, I think it m-y be profitably printed, and more profitably taught in the University. The cause of my writing that Book, was the consideration of what the Ministers before, and in the beginning of the Civill War, by their preaching and writing did contribute thereunto. Which I saw not onely to -end to the Abatement of the then Civill Power, but also to the gaining of as much thereof as they could (as did afterwards more plainly appear) unto themselves. I saw also that those Ministers, and many other Gentlemen who were of their Opinion, brought their Doctrines against the Civill Power from their Studies in the Universities. Seeing therefore that so much as could be contributed to the Peace of our Country, and the settlement of Sovereign Power without any Army, must proceed from Teaching; I had reason to wish, that Civill Doctrine were truly taught in the Universities. And if I had not thought that mine was such, I had never written it. And having written it, if I had not recommended it to such as had the Power to cause it to be taught, I had written it to no purpose. To me therefore that never did write any thing in Philosophy to show my Wit, but (as I thought at least) to benefit some part or other of mankind, it was very necessary to commend my Doctrine to such men as should have the Power and Right to Regulate the Universities. I say my Doctrine; I say not my *Leviathan*. For wiser men may so digest the same Doctrine as to fit it better

for a publique teaching. But as it is, I beli-ve it hath framed the mines of a thousand Gentlemen to a consciencious obedience to present Government, which otherwise would have wave-ed in that Point. This therefore was no wanting, but a necessary part of the business I took in hand. You ought also to have considered, that this was said in the close of that part of my Book which concerneth Policy meerly Civill. Which part if you the Astronomer, that no- think the Doctrine unworthy to be taught, were pleased once to honour with praises printed before it, you are not very constant, no- ingenuous. But whether you did so or not, I am not curtain, though it was - old me for certain. If it were not you, it was some body else whose Judgement has as much weight at least as yours.

And for any thing you have to say from your own knowledge, I remember not that ever I saw eithe- of your faces. Yet you the Professor of Geometry go about obliquely to make me believe that Vindex hath discoursed with me, once at least, though I remember it not. I suppose it therefore true; But this I am sure is false, that either he or any man living did ever hear me brag of my Science, or praise my self, but when my defence required it. Perhaps some of our Philosophe-s that were at Paris at the same time, and acquainted with the same Learned men that I was acquainted with, might take for bragging the maintaining of my opinions, and the not yiel-ing to the reas-ns alieadged against them. If that be ostentation, they tell you the truth. But you that are so wise should have considered, that even such men as profess Philosophy are carried away with the passions of Emulation and Envy (the sole ground of this your accusation) as well as other men, and instanced in your selves. And this is sufficient to shake off your aspersions -f Ostentation and Self-conceit. For if I added, that my acquaintance know that I a- naturally of modest rather than of boasting speech, you will not believe it, becaus- you distinguish not

between that which is said upon provocation, and that which is said without
, from vain glory.

The next accusation is, That I will be very angry with all men that do not presently submit to my dictates; and that for advancing the reputation of my own skill, I care not what unworthy -ast on others. This is in the Epistle placed before the *Vindiciae Academicarum*, subscribed by N S, as the Plain Song for H D in the rest of the Book to D-scant upon. I know well enough the Auth — s names; and am sorry that N S has lent his name to be abused to so ill a purpose. But how does this appear? What Argument, what witness is there of it? You offer none; or at least I am not conscious of any. I begin to suspect, since you the Professor of Geometry have in your objections to the 20 Chapter these words concerning Vindex, *O-ularis ille testis de quo h-c agitur, erat, ni fallor, ille ipse*; That Vindex himself, in other company, has a visit on me. Seeing you will have me believe it, let it be so; and (as it is likely) not long after my return into England. At which time (for the reputation, it seems, I had gotten by my boasting) divers persons that professed to love Philosophy and Mathematiques, came to see me; and some of to let me see them, and hear and applaud what they applauded in themselves. I see now it hath happened to me with Vindex, as it happened to Dr. Harvey with Morisani. Morisani jesuite came out of Flanders hither, especially (as he sayes) to see what learned men in Divinity, Ethics, Physiques, and Geometry were here yet alive, to the end by discoursing with them in these Sciences, he might correct either his own, or theirs, was brought (say-s) to that most civill and renowned old man Dr. Harvey. very well. And in good earnest if he had made good use of the Time which was very much afforded him, he might have learned of him (or of no man living) very knowledge concerning the Circulation of the blood, the Generation of living Creatures, and many other difficult Points of naturall Philosophy. And if he had had any thing in him but common and childish learning, he could have

shewed it no where more to his advantage, then before him that was so great a Judge of such matters. But what did he? That pretious time (which was bat little, because he was to depart again presently for Flanders) he bestowed wholly in venting his own childish Opinions, not suffering the Doctor scarce to speak; losing thereby the benefit he came for, and discovering that he came not to hear what others could say, but to show to others how learned he was himself already. Why else did he take so little time, and so mispend it? Or why returned he not again? But when he had talked away his time, and found (though patiently and civilly heard) he was not much admired, he took occasion (writing against me) to be revenged of D. Harvey, by sleighting his learning publicuely; and tels me that his learning was onely Experiments, which he sayes I say have no more certainty then Civil Histories. Which is false. My words are, Ante hos nihil certi in Physicâ erat praeter Experimenta -ui{que} sua, & Historias Naturales, si tamen & -ae dicendae -ertae sint, quae Civilibus Historiis cetiores n — sun-. Where I except expressly nom uncertainty the Experiments that every man maketh to himself. But you see the -ere-cut, by which vain Glory joyned with Ignorance passeth quickly over to E-vy and Contumely.

Thus it seems by your own confession I was used by Uin — x. He comes with some of my acquaintance in a Visit. What he said I know not, but if he -iscou-sed then, as in his Philosophicall Essay he writeth, I will be bold to say of my self, I was so far from morosity, o- (to use his Phrase) from being tetricall, as I may very well have a good opinion of my own patience. And if there passed between us the discourse you mention in your Elenchus, Pag. 116. it was an incivility in him so great, that without great civility I could not have abstained from bidding him be gone. That which passed between us, you say was this. I complained that whereas I made Sense, nothing but a perception of Motion in the Organ, nevertheless the Philosophy Schools through all Europel-d by the Text of A istotle, teach another Doctrin,

namely, that Sensation is performed by Species. This is a little mistaken. For I do glory, not complain, that whereas all the Universities of Europe hold Sensation to proceede from Species, I it to be a perception of Motion in the Organ. The answer of Vindex, you say, was, That the other Hypothesis, whereby Sense was explicated by the Principles of Motion, was commonly admitted here before my Book came out, as having been sufficiently delivered by Des Car — s, Gassendus and Sir Kenelme Digby before I had published any thing in this kinde. This then, it seems, was it that made me angry. Truly I remember not any angry word that ever I uttered in all my life to any man that came to see me, though some of them have troubled me with very impertinent discourse; and with those that argued with me, how -pertinently s-ever, I alwayes thought it more civility to be somewhat earnest in the defence of my opinion, then by obstinate and affected silence to let them see I contemned them, or hea-kned not to what they said. I- I were earnest in making good, that the manner of Sensation by such Motion as I had explicated in my Leviathan, is in none o- the Authors by him named, it was not Anger, but a ca-e of not offending him, with any signe of the contempt -hich his discourse deserved. But it was Incivility in him to make use of a Visi-, which all men take for a p-ofessi-n of Friendship, to tell me that that which I had already published for my own, was found before by Des Cartes, Gassendus, and Sir Kenelme Digby. But let any man read Des Cartes, he shall finde, that he attributeth no Motion at all to the object of sense, but an inclination to action, which inclination no man can imagine what it meaneth. And for Gassendus, and S. Kenelme Digby, it is manifest by their writings, that their opinions are not different from that of Epicurus, which is very different from mine. O- if these two, or any of those I conversed with at Paris, had prevented me in publi — ing my own D — trine, yet since it was there known, and declared for mine by Mersennus in the P-eface to his Ballistica (of which the three fi-st leaves are

employed wholly in the setting of my opinion concerning sense, and the rest of the faculties of the Soul) they ought not therefore to be said to have found it out before me. And consequently this answer which you say was given me by Vindex was nothing else but Untruth and Envy; and (because it was done by way of Visit) Incivility. But you have not alleadged, nor can alleadge any words of mine, from which can be drawn that I am so angry as you say I am with those that submit not to my Dictates. Though the discipline of the University be never so good; yet certainly this behaviour of yours and his are no good Arguments to make it thought so. But you the Professor of Geometry, that out of my words spoken against Vindex in my 20 Chapter, argue my angry humour; do just as well, as when (in your Arithmetica Infinitorum) from the continuall increase of the excess of the row of Squares above the third part of the aggregate of the greatest, you conclude they shall at last be equall to it. For though you knew that Vindex had given me first the worst words that possibly can be given, yet you would have that return of mine to be a Demonstration of an angry humour; not then knowing what I told you even now in the beginning of this Lesson, of the sentence given by Vespasian. But to this Point I shall speak again hereafter.

Your third Accusation is, That I had my doctrine of Vision, which I pretend to be my own, out of papers which I had a long time in my hands of Mr. Warners. I never had sight of any of Mr. Warner's papers in all my life but that of Vision by Refraction (which by his approbation I carried with me to Paris, and caused it to be printed under his own name, at the end of Mersennus his *Cogitata Physico-Mathematica*, which you may have there seen) and another Treatise of the Proportions of Alloy in Gold and Silver coine; which is nothing to the present purpose. In all my conversation with him, I never heard him speak of any thing he had written, or was writing de *Penicillo optico*. And it was from me that he first heard it mentioned that

Light and Colour were but Fancy. Which he imbraced presently as a truth, and told me it would remove a rub he was then come to in the discovery of the place of the Image. If after my going hence he made any use of it (though he had it from me, and not I from him) it was well d-ne. But wheresoever you finde my Principles, make use of them, if you can, to demonstrate all the Symptomes of Vision; and I will do (or rather have done and mean to publish) the same; and let it be judged by that, whether those Principles be of mine, or other mens invention. I give you time enough, and this advantage besides, that much of my Optiques hath been privately read by others. For I never refused to lend my papers to my friends, as knowing it to be a thing of no prejudice to the advancement of Philosophy, though it be (as I have found it since) some prejudice to the advancement of my own reputation in those Sciences; which reputation I have alwayes postposed to the common benefit of the studious.

You say further (you the Geometrician) that I had the Proposition of the Spirall Line equall to a Parabolicall Line from Mr. Robervall. True. And if I had remembred it, I would have taken also his demonstration, though if I had publisht his, I would have suppressed mine. I was comparing in my thoughts those two Lines, Spirall and Parabolicall, by the Motions wherewith they were described; and considering those Motions as uniform, and the Lines from the Center to the Circumference, not to be little Parallelograms, but little Sectors, I saw that to compound the true Motion of that Point which described the Spirall, I must have one Line equall to half the Perimeter, the other equall to half the Diameter. But of all this I had not one word written. But being with Mersennus and Mr. Robervall in the Cloister of the Convent, I drew a Figu-e on the wall, and Mr. Robervall perceiving the deduction I made, told me that since the Motions which make the Parabolicall Line, are one uniform, the other accelerated, the Motions that make the Spirall must be so also; Which I presently

acknowledged; and he the next day, from this very method brought to Mersennus the demonstration of their equality. And this is the mentioned by Mersennus, Pro. Corol. 2. of his *Hydraulica*; Which I know not who hath most magnanimously interpreted to you in my disgrace.

The fourth accusation is, That I have injured the Universities. Wherein? First In that I — oul- have the Doctrine of my Leviathan by entire Sovereignty imposed on them. You often upb-aid me with thinking well of my own Doctrine; and gram by consequence, that I thought this Doctrine good. I desired not therefore that any thing should b- imposed upon them, but what (at least in my opinon) was good both for the Common-wealth and them. Nay more I would have the State make use of them to uphold the civill Power, as the Pope did to uphold the Ecclesiasticall. Is it not absurdly done to call this an Injury? But to question (you will say) whether the Civill Doctrine there taught, be such as it ought to be, or not, -...a disgrace to the Unive-sities. If that be certain, it is ce-tain also that those Se-mons and Books, which have been preached and published, both against the former and the present Government, directly or obliquely, were not made by such Ministe-s and others as had their breeding in the Universities; though all men know the contrary. But the Doctrine which I would have to be taught there, what is it? It is this, That all men that live in a Common-wealth, and receive protection of their lives and fortunes from the Supreme Governour thereof, are reciprocally -ound as far as they are able, and shall be required, to protect that Governour. Is it, think you, an un-e-sonable thing to impose the teaching of such Doctrine upon the Universities? O- will you say they taught it before, when you know that so many men which came from the Universities to preach to the People, and so many others that were not Ministers did stir the People up to resist the then Supreme Civill Power? And was it not truly therefore said, that the Universities receiving their Discipline from the Authority of the Pope, were the Shops, and Operatories

of the Clergy? Though the Competition of the P-pall and Civill power be tatakene now away, yet the Competition between the Ecclesiasticall and the Civill power hath manifestly enough appeared very lately. But neither is this an upbraiding of an University (which is a Corporation or Body Artificial) but of particular men that desire to uphold the Authority of a Church, as of a distinct thing from the Common-wealth. How would you have exclaimed, it instead of -ecomending my Lev-athan to be taught in t-e Universities, I had recommen-... the erecting of a New and Lay-University, whe-ein Lay-men should have the reading of Physiqu-s, Mathematicks, Morall Philosophy, and Politicks, as the Clegy have now the sole teaching or Divinity? Yet the thing would be profitable, and tend much to the Polishing of ma-...s -ature, without much publique charge. There will need but one House, and the endowment of a few Professions. And to make some learn the better, it would do very well that none should come thither sent by their Parents, as to a Trade to get their living by, but that it should be a place for such ingenuous men, as being free to dispose of their own time, love Truth for it self. In the mean time Divinity may go on in Oxford and Cambridge to furnish the Pulpit with men to cry down the Civil Power, if they continue to do as they did. If I had (I say) made such a Motion in my Leviathan, though it would have offended the Divines, yet it had been no injury. But 'tis an injury (you will say) to deny in generall the utility of the Antient Schooles, and to deny that we have received from them our Geometry. True, if I had not spoken distinctly of the Schools of Philosophy, and said expresly, that the Geometricians passed n-t then under the name of Philosophers; and that in the School of Plato (the best of the Antient Philosophers) none were received that were not alrea-y in some measure Geometricians. Euclide taught Geometry; but I never heard of a Sect of Philosophers, called Euclidians, or Alexandrians, or ranged with any of the other Sects, as Peripat-tiques, Stoiques, Academiques, Epicureans, Pyrrhonians, &c. But

what is this to the Universities of Christendome? Or why are we beholding for Geometry to our Universities, more then to Gresham Colledge, or to private men in London, Paris, and other places, which never taught or learned it in a publique School? For even those men that living in our Universities have most advanced the Mathematiques, attained their knowledge by other means then that of publique Lectures, where few Auditors, and those of unequall proficiency cannot make benefit by one and the same Lesson. And the true use or publique Professors, especially in the Mathematiques, being to resolve the Doubts, and Problems (as far as they can) of such as come unto them with desire to be informed.

That the Universities now are not regulated by the Pope, but by the Civill Power, is true, and well. But where say I the contrary? And thus much for the first injurie.

Another (you say) is this, that in my Leviathan Pag. 380. I say, The principall Schooles were or-a-n-d for the three Professions of Roman Religion, Roman Law, and the Art of Medicine. Thirdly, that I say. Philosophy had no otherwise place there then as a hand-maid to Roman Religion, Fourthly, since the authority of Aristotle was received there, that Study is not pr-perly Philosophy but A-ist-telity. Fifthly, That for Geometry, till of late times it had no place there at all. As for the second, it is too evident to be denied; the Fellowships having been all ordained for those Professions; and (saving the Change of Religion) being so yet. Nor hath this any Reflection upon the Universities, either as they now are, or as they then we-e, seeing it was not in their own power to endow themselves, or to receive other Laws and Discipline then their Founder, and the State were pleased to ordain. For the third, it is also evident. For all men know that none but of the Roman Religion had any Stipend or pre-e-ment in any University, where that Religion was established; No, nor for a great w-ile, in their Common-wea-...s; but were every where persecuted as H-r-tiques.

But you will say the words in my L-viat-an are not, Philosophy ha- no place, but hath no place. Are you not ashamed to -y charge a mistake or the word hath-o-had? Which was either a mistake of the Printer, or i- it so in the Copy, it could be no other then the mistake of a letter in the writing, unless you think you ca — ke m-n believe that after fifty years being acquainted with what was publiquely p-of-st an- practised in Ox — rd and Cambridge, I knew not what Religion they were of. taking advantage from the mistake a word, or of a l-t-er, I finde also in the Elenchus, whe — for praetendit s-s-ire, there is praetendit s-ire, wh — you the Geome — ician -...mble, mistaking it I think for an Anglicisme, not for a fault in the impression.

To the -o — th, you p-ete-d, that men are not now so tied to Arist-tle as not to enjoy a liberty of Philosop-i — g, it were otherwise when I was conversant in Magdalen Hall. Was it so then? -hen am I absolved, unless you can shew some publique A — of the University made since that time to alte- it. For it is not enough to name some few particular ingenuous men that usu-p- Liberty in their private discourses, or (with connivence) in their p-blike disputatio-s. And your Doctrine, that even here you avow, of Abstracted Essences, Immatertall Substances, and of Nunc-stans; and your improper language in using the word (not as mine, for I have it no where) Successive Eternity; as also your Doctrine of Condensation, and your a-guing from naturall reason the incomp-eh-nsible Mysteries of Religion, and your Malicious W-iting, are very -...wd — gnes, that you your selves are none of those which you say do freely Philosophise, but that both your Philosophy and your Language are under the S-rvitude, not of the Roman Religion, but of the Ambition of some other Docto-s, that seek, as the Romish Clergy did, to draw all humane learning the upholding of their Power Ecclesiasticall. Hitherto therefore there is no injury done to t-e Universiti — or fifth, you grant it, namely, That till of late there was no allowance for the -...ing o- G-...ry. But least you -houl- be thought to grant

me any thing, y-u say, you th-, G-ome-ry hath now s- much plac- in the Universities, that when Mr.-...bs shall -au- published his Phi — sophericall an- Geometricall p — s, you assur- your you shall be g-eat -umb-er in the University, who will un — rst-n- as much or more of them, -esireth — ul-, &c. But though this be o- t — now, yet it maketh nothing against my . I k — w enough that Sir He-ry S — iles-ectu — s w — e rounde- an- e-...owed Di- I — ny th-n, th-t there were in Oxford-any Geometricians? But I — ny now,-...at or you is or the Number. For my Philosophicall and G-... pi — es, , and you have understood onely so muc- in them, as all will easily by your o-jectio-s to them, and by your own pub-... Geometry, that neither or you understand any in P-ilos-phy or in . And yet you woul- have Books o-yours -o an A-g — en-, and to be an Ind-x o- the Philosophy and Geomet-y -e -ound in the . W-... is a greater injury and di-g-ace to them, th — any wo — s o- mine though by -o-r selves.

Your last and greatest accusation, or rather railing (for an Accusation should contain, whether true or false, some particular fact, or certain words, out of which it might seem at least to be inferred) is, that I am an enemy to Religion. Your words are, It is said that Mr Hobs is no otherwise an Enemy to the Roman Religion, saving onely as it hath the name of Religion. This is said by Vindex. You the Geometrician in your Epistle Dedicatory say thus, With what pride and imperiousness be tramples on all things both Humane and Divine, uttering fearfull and horrible words of God, (peace) of Sin, of the Holy Scripture, of all Incorporeal substances in generall, of the Immortall soul of man, and of the rest of the weighty points of Religion (down) it is not so much to be doubted as lamented. And at the end of your objections to the 18 Chapter, Perhaps you take the whole History of the Fall of Adam for a Fable, which is no wonder, wh-... you say the Rules of honouring and worshipping of God are to be taken from the Laws. Down I say; you ba-ke now at the Supreme Legislative Power. Therefore it is not I,

but the Laws which must rate you off. But do not many other men as well as you read my Leviathan, and my other Books? And yet they all finde not such enmity in them against Religion. Take heed of calling them all Atheists that have read and approved my Leviathan. Do you think I can be an Atheist and not know it? Or knowing it durst have offered my Atheism to the Press? Or do you think him an Atheist, or a co-... of the Holy Scripture, that sayeth nothing of the Deity, but what he prov-... by the Scripture? You that take so hainously that I would have the Rules of Gods worship- a Christian Common-wealth taken from the Laws, tell me, from whom you would have them taken? From yourselves? Why so, more then from me? From the Bishops? Right, if the Supreme Power of the Common-wealth will have it so; If not, why from them rather then from me? From a Consistory of Presbyters by themselves, or joyned with Lay-Elders, whom they may sway as they please? Good, If the Supreme Governour of the Common-wealth will have it so. If not, why from them, rather then from me, or from any man else? They are wiser and learn-der then I. It may be so; but it has not yet appeared. Howsoever, let that be granted. Is there any man so very a fool as to subject himself to the Rules of other men in those -...ings which so neerly concern himself, for the Title they assume of being wise and learned, unless they also have the sword which must protect them. But it seems you understand the sword as comprehended. If so, do you not then receive the Rules of Gods worship from the Civill Power? Yes doubtless; and you would expect, if your Consistory had that sword, that no man should dare to exercise o- teach any Rules concerning Gods worship which were not by you allowed. See therefore how much you have been transported by your malice towards me, to injure the Civill Power by which you live. If you were not despised, you would in some places and times, where and when the Laws are more severely executed, be shipt away for this your madness to America, I would say, to Anticyra. What luck have I,

when this, of the Laws being the Rules of Gods publique worship, was by me said and applyed to the Vindication of the Church of England the Power of the Roman Clergy, it should be followed with such a storm from the Ministers Presbyterian and Episcopall of the Church of England? Again, for those other Points, namely, that I approve not of Incorporeall Bodies, not of other Immortality of the soul, then that which the Scripture calleth Eternall Life, I do but as the Scripture leads me. To the Texts whereof by me alleadged, you should either have answered, or forborne to revile me for the conclusions I derived from them. Lastly, what an absurd question is it to ask me whether it be in the Power of the Magistrate, whether the world be eternall or not? It were fit you knew in the Power of the Supreme Magistrate to make a Law for the punishment of them that shall pronounce publicquely of that question any thing contrary to that which the Law hath once pronounced. The truth is, you are content that the Papall power be cut off, and declaimed against as much as any man will; but the Ecclesiasticall Power which of late was aimed at by the Clergy here, being a part thereof, every violence done to the Papall Power is sensible to them yet; like that which I have heard say of a man, whose leg being cut off for prevention of a Gangrene that began in his Toe, would nevertheless complain of a pain in his Toe, when his leg was cut off.

Thus much in my defence; which I believe if you had foreseen, this Accusation of yours had been left out. I come now to examine (though it be done in part already) what Manners those are which I finde every where in your Writings.

And first, How came it into your minds that a man can be an Atheist, I mean an Atheist in his Conscience? I know that David confesseth of himself, upon sight of the Prosperity of the wicked, that his feet had almost slipt, that is, that he had slipt into a short doubtfulness of the Divine Providence. And if any thing else can cause a man to slip in the same kinde,

it is the seeing such as you (who though you write nothing, but what is dictated to each of you by a Doctor of Divinity) to break the greatest of Gods Commandement (which is Charity) in every Line before his face. And though such forgettings of God be somewhat more then shor- doubtings, and sudden transportations incident to humane Passion, yet I do not for that cause think you Atheists, and enemies of Religion, but onely ignorant and imprudent Christians. But how, I say, could you think me an Atheist, unless it were because finding your doubts of the Deity more frequent then other men do, you are thereby the apter to fall upon that kinde of reproach? Wherein you are like women of poor & evil Education when they scold; amongst whom the readiest disgracefull word is Whore. Why not Thief, or any other ill name, b-t because when they remember themselves, they think that reproach the likeliest to be true?

Secondly, tell me what crime it was which the Latines called by the name of Scelus? You think not (unless you be Stoiques) that all Crimes are equall. Scelus was never used but for a Crime of greatest mischief, as the taking away of Life and Honour; and besides, basely acted, as by some clandestine way, or by such a way as might be covered with a Lve. But when you insinuate in a writing publisht that I am an Atheist, you make your selves Authors to the multitude, and do all you can to stir them up to attempt upon my life; and if it succeed, then to sneak out of it by leaving the fault on them that are but actors. This is to indeavour great mischief basely; and therefore Scelus. Again, to deprive a man of the honour he hath merited, is no little wickedness; and this you endeavour to do by publishing falsely that I challenge as my own the inventions of other men. This is therefore Scelus Publicuely to tel all the world that I will be angry with all men that do not presently submit to my Dictates; to deprive me of the friendship of the world. Great dammage, and a lie, and yours. For to publish any untruth of another man to his disgrace, on hear-say from his enemy, is

the same fault as if he published it on his own credit. I- I should say I have heard that Dr. Wallis was esteemed at Oxford for a simple fellow, and much inferior to his fellow-professor Dr. Wallis- (as indeed I have heard, but do not believe it) though this be no great disgrace to Dr. Wallis, yet he would think I did him injury. Therefore publick Accusation upon hear-say is Scelus. And whosoever does any of these things does Scelus rate. But you the Professors of the Mathematicks at Oxford, by the advice of two Doctors of Divinity have dealt thus with me. Therefore you have done (I say not foolishly, though no wickedness he without folly, but Scelus — ,.

Thirdly, it is ill Manners, in reprehending truth-, to send a man in a boasting way to your own errors; as you the Professor of Geometry have often sent me to your two Treatises of the Angle of Contact, and Arithmetica Infinitorum.

Fourthly, it is ill Manners, to diminish the just reputation of worthy men after they be dead, as you the Professor of Geometry have done in the case of Joseph Scaliger.

Fifthly, when I had in my Leviathan suffered the Clergy of the Church of England to -...pe, you did imprudently in bringing any of them in again. An Ulysses upon so light an occasion would not have ventured to again into the Cave of Polyphemus.

Lastly, how ill does such Levi-y and Scurrility, which both of you have shewn so often in your writings, become the gravity and sanctity requisite to the calling of the Ministry? They are too many to be repeated. Do but consider you the Geometrician how unhandsome it is to play upon my name, when both yours and mine are plain names; though from Wallis by Wallis, you go from yours in Wallisius. The -est of using at every word M-Hobb-, is lost to them beyond Sea. But this is not so ill as some of the rest. I will write out one of them as it is in the fourth Page of your Elenchus; Whence it appears that your Empusa was of the number of those Fairies

which you call in English Hob-goblins. The word is male ofand; and -hence comes the childrens play called the play of Empusa, Anglicé (hitherto in Latine all but Hob-goblins, then follows) Fox, Fox, come out of your hole (in English, then in Latine again,) in which the boy that is called the Fox, holds up one foot, and jumps with the other, which in English is to hop. When a stranger shall read this, and hoping to finde therein some witty conceit, shall with much adoe have gotten it interpreted and explained to him, what will he think of our Doctors of Divinity at Oxford, that will take so much pains as to go out of the language they set forth in, for so ridiculous a purpose? You will say it is a pretty Paranomafia. How you call it there I know not, but it is commonly called here a Clinch; and such a one as is too insipide for a boy of twelve years old, and very unfit for the sanctity of a Minister, and gravity of a Doctor of Divinity. But I pray you tell me where it was you read the word Empusa for the boys play you speak of, or for any other play amongst the Greeks. In this (as you have done throughout all your other writings) you presume too much upon your first cogitations. There be a hundred other scoffing passages, and ill-favoured attributes given me in both your writings, which the Reader will observe without my pointing to them, as easily as you would have him; and which perhaps some young Students, finding them full of Gall, will mistake for Salt. Therefore to disabuse those youngmen, and to the end they may not admire such kind of wit, I have here and there been a little with you then else I would have been. If you think I did not spare you, but that I had not wit enough to give you as scornfull names as you give me, are you content I should try? Yes (you the Geometrician will say) give me what names you please, so you call me not Arithmetica Infinitorum (I will not.) Nor Angle of Contact, nor Arch-Spirall, Nor Quotient (I will not.) But I here dismiss you both together. So go your wayes, you uncivill Ecclesia, — ques, Inhumane Divines, Dedoctors of Morality, Unafinous Colleagues,

Egregious pa-r of Iss-..., most wretched Vindices and Indices
Academi-arum; and remember Vespasians Law, that it is uncivill to give ill
language first, but civill and lawfull to return it. But much more remember
the Law of God, to obey your Sovereigns in all things; and not only not to
dero-... from them, but also to pray for them, and as far as you can to
maintain their Authority, and therein your own . (do you hear?) take heed of
speaking your minde so cleerly in answering m- Leviathan, as I have done
in writing it. You should do best not to meddle with it at all, because it is
undertaken, and in part published already, and will be better performed,
from Term to Term, by one Christopher Pike.

Seven Philosophical Problems

1682 TRANSLATION OF 'PROBLEMATICA PHYSICA'

CONTENTS

TO THE KING.

PHILOSOPHICAL PROBLEMS

CHAP. I. PROBLEMS OF GRAVITY.

CHAP. II. PROBLEMS OF TIDES.

CHAP. III. PROBLEMS OF VACUUM.

CHAP. IIII. PROBLEMS OF HEAT AND LIGHT.

CHAP. V. PROBLEMS OF HARD AND SOFT.

CHAP. VI. PROBLEMS OF RAIN, WIND, AND OTHER WEATHER.

CHAP. VII. PROBLEMS OF MOTION PERPENDICULAR, OBLIQUE;
OF PRESSION AND PERCUSSION; REFLECTION AND
REFRACTION; ATTRACTION AND REPULSION.

CHAP. VIII. THE DELPHIQUE PROBLEM OR DUPLICATION OF THE
CUBE.

TO THE KING.

THAT WHICH I do here most humbly present to Your Sacred Majesty, is the best Part of my Meditations upon the Natural Causes of Events, both of such as are commonly known, and of such as have been of late artificially exhibited by the Curious.

They are ranged under seven Heads. 1. Problems of Gravity. 2. Problems of Tides. 3. Problems of Vacuum. 4. Problems of Heat. 5. Problems of Hard and Soft. 6. Problems of Wind and Weather. 7. Problems of Motion Perpendicular, and Oblique, &c. To which I have added, Two Propositions of Geometry; One is, The Duplication of the Cube, hitherto sought in vain; The other, A Detection of the absurd Use of Arithmetick, as it is now applied to Geometry.

The Doctrine of Natural Causes hath not infallible and evident Principles. For there is no Effect which the Power of God cannot produce by many several ways.

But seeing all Effects are produced by Motion, he that supposing some one or more Motions can derive from them the necessity of that Effect whose Cause is required, has done all that is to be expected from Natural Reason. And though he prove not that the thing was thus produced, yet he proves that thus it may be produced, when the Materials, and the power of Moving is in our hands; which is as useful as if the Causes themselves were known. And notwithstanding the absence of rigorous Demonstration, this Contemplation of Nature (if not rendred obscure by empty terms) is the most Noble Imployment of the Mind that can be, to such as are at leisure from their necessary Business.

This that I have done I know is an unworthy Present to be offered to a KING, though considered (as God considers Offerings) together with the Mind and Fortune of the Offerer, I hope will not be to Your Majesty unacceptable.

But that which I chiefly consider in it is, that my Writing should be tried by Your Majesties Excellent Reason untainted with the Language that has been invented or made use of by Men when they were puzzled; and who is acquainted with all the Experiments of the time; and whose approbation (if I have the good Fortune to obtain it) will protect my reasoning from the Contempt of my Adversaries.

I will not break the custom of joyning to my Offering a Prayer; And it is, That Your Majesty will be pleased to pardon this following short Apology for my Leviathan. Not that I rely upon Apologies, but upon Your Majesties most Gracious General Pardon.

That which is in it of Theology, contrary to the general Current of Divines, is not put there as my Opinion, but propounded with submission to those that have the Power Ecclesiastical.

I did never after, either in Writing or Discourse, maintain it.

There is nothing in it against Episcopacy; I cannot therefore imagine what reason any Episcopal-man can have to speak of me (as I hear some of them do) as of an Atheist, or man of no Religion, unless it be for making the Authority of the Church wholly upon the Regal Power; which I hope Your Majesty will think is neither Atheism nor Heresie.

But what had I to do to meddle with matters of that nature, seeing Religion is not Philosophy, but Law?

It was written in a time when the pretence of Christ's Kingdom was made use of for the most horrid Actions that can be imagined; And it was in just Indignation of that, that I desired to see the bottom of that Doctrine of the Kingdom of Christ, which divers Ministers then Preached for a Pretence

to their Rebellion; which may reasonably extenuate, though not excuse the writing of it.

There is therefore no ground for so great a Calamny in my writing. There is no sign of it in my Life; and for my Religion, when I was at the point of Death at St. Germaines, the Bishop of Durham can bear witness of it, if he be asked. Therefore, I most humbly beseech Your Sacred Majesty not to believe so ill of me upon reports, that proceed often (and may do so now) from the displeasure which commonly ariseth from difference in Opinion; nor to think the worse of me, if snatching up all the Weapons to fight against Your Enemies, I lighted upon one that had a double edge.

Your Majesties Poor and most Loyal Subject, THOMAS HOBBS.

PHILOSOPHICAL PROBLEMS

CHAP. I. PROBLEMS OF GRAVITY.

A.

WHAT may be the cause, think you, that stones, and other bodies, thrown upward, or carried up and left to their liberty, fall down again (for ought a man can see) of their own accord? I do not think (with the old Philosophers) that they have any love to the Earth, or are sullen, that they will neither go nor stay. And yet I cannot imagine what body there is above that should drive them back.

B.

For my part, I believe the cause of their descending is not in any natural appetite of the bodies that descend, but rather that the Globe of the Earth hath some special motion, by the which it more easily casteth off the Air, than it doth other bodies. And then this descent of those we call heavy bodies, must of necessity follow; unless there be some empty spaces in the world to receive them. For when the Air is thrown off from the Earth, somewhat must come into the place of it, (in case the world be full) and it must be those things which are hardliest cast off, that is those things which we say are heavy.

A.

But suppose there be no place empty (for I will defer the Question till anon) how can the Earth cast off either the Air, or any thing else?

B.

I shall shew you how, and that by a familiar Example. If you lay both your hands upon a Basen with water in it, how little soever, and move it circularly, and continue that motion for a while, and you shall see the water rise upon the sides, and fly over; by which you may be assured that there is a kind of circulating motion, which would cast off such bodies as are contiguous to the body so moved.

A.

I know very well there is; and it is the same motion which Country people use to purge their Corn; For the Chaff and Straws, by casting the Grain to the side of the Seive, will come towards the middle. But I would see the Figure.

B.

Here it is. There is a Circle pricked out, whose Center is A, and three less Circles, whose Centers are B, C, D; let every one of them represent the Earth, as it goeth from B to C, and from C to D, always touching the uttermost Circle, and throwing off the Air, as is marked at E and F. And if the world were not full, there would follow by this scattering of the Air, a great deal of space left empty. But supposing the world full, there must be a perpetual shifting of the Air, one part into the place of another.

A.

But what makes a stone come down, suppose from G?

B.

If the Air be thrown up beyond G, it will follow, that at the last, if the motion be continued, all the Air will be above G, that is, above the stone; which cannot be, till the stone be at the Earth.

A.

But why comes it down still with encreasing swiftness?

B.

Because as it descends, and is already in motion, it receiveth a new impression from the same cause, which is the Air, whereof as part mounteth, part also must descend, supposing as we have done the plenitude of the world. For, as you may observe by the Figure, the motion of the Earth, according to the Diameter of the uttermost Circle, is progressive; and so the whole motion is compounded of two motions, one circular, and the other progressive; and consequently the Air ascends and circulates at once. And because the stone descending receiveth a new pressure in every point of its way, the motion thereof must needs be accelerated.

A.

'Tis true; For it will be accelerated equally in equal times; and the way it makes will encrease in a double proportion to the times, as hath heretofore been demonstrated by Galileo. I see the solution now of an Experiment, which before did not a little puzzle me. You know that if two plummets hang by two strings of equal length, and you remove them from the perpendicular equally, I mean in equal angles, and then let them go, they will make their turns and returns together, and in equal times; And though the arches they describe grow continually less and less, yet the times they

spend in the greater arches, will still be equal to the time they spend in the lesser.

B.

'Tis true. Do you find any Experiment to the contrary?

A.

Yes; For if you remove one of the plummets from the perpendicular, so as (for example) to make an angle with the perpendicular of 80 degrees, and the other so as to make an angle of 60 degrees, they will not make their turns and returns in equal times.

B.

And what say you is the cause of this?

A.

Because the arches are the spaces which these two motions describe, they must be in double proportion to their own times; which cannot be, unless they be let go from equal altitudes, that is, from equal angles.

B.

'Tis right; and the Experiment does not cross, but confirm the equality of the times in all the arches they describe, even from 90 degrees to the least part of one degree.

A.

But is it not too bold, if not extravagant, an assertion, to say the Earth is moved as a man shakes a Basen or a Seive? Does not the Earth move from West to East every day once, upon his own Center, and in the Ecliptick Circle once a year? And now you give it another odd motion; How can all these consist in one and the same body?

B.

Well enough. If you be a Shipboard under sail, do not you go with the Ship? Cannot you also walk upon the Deck? Cannot every drop of bloud move at the same time in your veins? How many motions now do you assign to one and the same drop of bloud? Nor is it so extravagant a thing to attribute to the Earth this kind of motion; but that I believe if we certainly knew what motion it is that causeth the descent of bodies, we should find it either the same, or more extravagant. But seeing it can be nothing above that worketh this effect, it must be the Earth it self that does it; and if the Earth, then you can imagine no other motion to do it withal, but this; And you will wonder more, when by the same motion I shall give you a probable account of the causes of very many other works of Nature.

A.

But what part of the Heaven do you suppose the Poles of your pricked Circle point to?

B.

I suppose them to be the same with the Poles of the Ecliptick. For, seeing the Axis of the Earth in this Nation, and in the annual motion keeps parallel to it self, the Axis must in both motions be parallel as to sense. For, the

Circle which the Earth describes, is not of visible magnitude at the distance it is from the Sun.

A.

Though I understand well enough how the Earth may make a stone descend very swiftly under the Ecliptick, or not far from it, where it throws off the Air perpendicularly; yet about the Poles of the Circle methinks it should cast off the Air very weakly. I hope you will not say that bodies descend faster in places remote from the Poles, than nearer to them.

B.

No; but I ascribe it to the like motion in the Sun and Moon. For such motions meeting, must needs cast the stream of the Air towards the Poles; And then there will be the same necessity for the descent there, that there is in other places, though perhaps a little more slowly. For you may have observed that when it snows in the South Parts, the flakes of Snow are not so great as in the North; which is a probable sign they fall in the South from a greater height, and consequently disperse themselves more, as water does that falls down from a high and steep Rock.

A.

'Tis not improbable.

B.

In natural causes all you are to expect is but probability; which is better yet then making Gravity the cause, when the cause of Gravity is that you desire to know; and better then saying the Earth draws it, when the Question is, how it draws?

A.

Why does the Earth cast off Air more easily than it does Water, or any other heavy bodies?

B.

It is indeed the Earth that casteth off that Air which is next unto it. But it is that Air which casteth off the next Air; and so continually Air moveth Air; which it can more easily do then any other thing, because like bodies are more susceptible of one anothers motions; as you may see in two Lutestrings equally strained, what motion one string being stricken communicates to the Air, the same will the other receive from the Air; but strained to a differing note, will be less, or not at all moved. For there is no body but Air that hath not some internal, though invisible motion of its parts. And it is that internal motion which distinguisheth all natural bodies one from another.

A.

What is the cause why certain Squibs, though their substance be either Wood or other heavy matter, made hollow and filled with Gunpowder, which is also heavy, do nevertheless when the Gunpowder is kindled, fly upwards?

B.

The same that keeps a man that swims from sinking, though he be heavier then so much water; He keeps himself up, and goes forward by beating back the water with his Feet; and so does a Squib, by beating down

the Air with the stream of the fired Gunpowder, that proceeding from its Tail makes it recoil.

A.

Why does any Brass or Iron Vessel, if it be hollow, flote upon the water, being so very heavy?

B.

Because the Vessel and the Air in it, taken as one body, is more easily cast off than a body of water equal to it.

A.

How comes it to pass, that a Fish (especially such a broad Fish as a Turbut or a Plaice, which are broad and thin) in the bottom of the Sea, perhaps a mile deep, is not press'd to death with the weight of water that lies upon the back of it?

B.

Because all heavy bodies descend towards one point, which is the Center of the Earth, and consequently the whole Sea descending at once does arch it self so, as that the upper parts cannot press the parts next below them.

A.

It is evident; Nor can there be possibly any weight, as some suppose there is, of a Cylinder of Air, or Water, or of any other liquid thing, while it remains in its own Element, or is sustained and inclosed in a Vessel, by which one part cannot press the other.

CHAP. II. PROBLEMS OF TIDES.

A.

WHAT makes the Flux and Reflux of the Sea twice in a natural day?

B.

We must come again to our Basen of water; wherein you have seen, whilst it was moved, how the water mounteth up by the sides, and withal goes circling round about. Now if you should fasten to the inside of the Basen some bar from the bottom to the top, you would see the water, instead of going on, go back again from that bar, ebbing, and the water on the other side of the bar to do the same, but in counter-time; and consequently to be highest where the contrary streams meet together, and then return again, marking out four quarters of the Vessel, two by their meeting, which are the high waters, and two by their retiring, which are the low waters.

A.

What bar is that you find in the Ocean, that stops the current of the water, like that you make in the Basen?

B.

You know that the main Ocean lies East and West, between India and the Coast of America; and again, on the other side, between America and India.

If therefore the Earth have such a motion as I have supposed, it must needs carry the current of the Sea East and West; In which course, the bar that stoppeth it is the South part of America, which leaves no passage for the water, but the narrow Streight of Magellan. The Tide rises therefore upon the Coast of America; And the rising of the same in this part of the world proceedeth from the swelling chiefly of the water there; and partly also from the North Sea, which lieth also East and West, and has a passage out of the South Sea by the Streight of Anian, between America and Asia.

A.

Does not the Mediterranean-Sea lie also East and West? why are there not the like Tides there?

B.

So there are, proportionable to their lengths, and quantity of water.

A.

At Genoa, at Ancona there are none at all, or not sensible.

B.

At Venice there are, and in the bottom of the Streights; and a current all along both the Mediterranean-Sea, and the Gulf of Venice; And it is the current that makes the Tides unsensible at the sides but the check makes them visible at the bottom.

A.

How comes it about that the Moon hath such a stroke in the business, as so sensibly to encrease the Tides at Full and Change?

B.

The motion I have hitherto supposed but in the Earth, I suppose also in the Moon, and in all those great Bodies that hang in the Air constantly, I mean the Stars, both fixed and errant. And for the Sun and Moon, I suppose the Poles of their motion to be the Poles of the Aequinoctial; which supposed, it will follow, (because the Sun, the Earth and the Moon at every Full and Change are almost in one streight line) that this motion of the Earth will be made swifter than in the Quarters. For this motion of the Sun and Moon being communicated to the Earth, that hath already the like motion, maketh the same greater; and much greater when they are all three in one streight line, which is only at the Full and Change, whose Tides are therefore called Spring Tides.

A.

But what then is the cause that the Spring-Tides themselves are twice a year, namely when the Sun is in the Equinoctial, greater than at any other times?

B.

At other times of the year, the Earth being out of the Aequinoctial, the motion thereof, by which the Tides are made, will be less augmented, by so much as a motion in the obliquity of 23 degrees or thereabout (which is the distance between the Aequinoctial and Ecliptick Circles) is weaker then the motion which is without obliquity.

A.

All this is reasonable enough, if it be possible that such motions as you suppose in these bodies, be really there. But that is a thing I have some reason to doubt of; For, the throwing off of Air, consequent to these motions, is the cause, you say, that other things come to the Earth; And therefore the like motions in the Sun, and Moon, and Stars, casting off the Air, should also cause all other things to come to every one of them. From whence it will follow, that the Sun, Moon, and Earth, and all other bodies but Air, should presently come together into one heap.

B.

That does not follow: For if two bodies cast off the Air, the motion of that Air will be repress'd both ways, and diverted into a course towards the Poles on both sides; and then the two bodies cannot possibly come together.

A.

'Tis true. And besides, this driving off the Air on both sides, North and South, makes the like motion of Air there also. And this may answer to the Question, How a stone could fall to the Earth under the Poles of the Ecliptick, by the only casting off of Air?

B.

It follows from hence, that there is a certain and determinate distance of one of these bodies (the Stars) from another, without any very sensible variation.

A.

All this is probable enough, if it be true that there is no Vacuum, no place empty in all the World. And supposing this motion of the Sun and Moon to be in the plain of the Aequinoctial, methinks that this should be the cause of the Diurnal motion of the Earth; And because this motion of the Earth is (you say) in the plain of the Aequinoctial, the same should cause also a motion in the Moon on her own Center, answerable to the Diurnal motion of the Earth.

B.

Why not? what else can you think makes the Diurnal motion of the Earth, but the Sun? And for the Moon, if it did not turn upon its own Center, we should see sometimes one, sometimes another face of the Moon, which we do not.

CHAP. III. PROBLEMS OF VACUUM.

WHAT CONVINCING ARGUMENT is there to prove, that in all the world there is no empty place?

B.

Many; but I will name but one; and that is, the difficulty of separating two bodies hard and flat laid one upon another; I say, the difficulty, not the impossibility. It is possible, without introducing Vacuum, to pull assunder any two bodies, how hard and flat soever they be, if the force used be greater than the resistance of the hardness. And in case there be any greater difficulty to part them, (besides what proceeds from their hardness) then there is to pull them further assunder when they are parted, that difficulty is Argument enough to prove there is no Vacuum.

A.

These Assertions need demonstration. And first, how does the difficulty of separation argue the Plenitude of all the rest of the world?

B.

If two flat polish'd Marbles lie one upon another, you see they are hardly separated in all points at one and the same instant; and yet the weight of either of them it is enough to make them slide off one from the other. Is not the cause of this, that the Air succeeds the Marble that so slides, and fills up the place it leaves.

A.

Yes certainly. What then?

B.

But when you pull the whole Superficies assunder, not without great difficulty, what is the cause of that difficulty?

A.

I think as most men do, that the Air cannot fill up the space between in an instant; For the parting is in an instant.

B.

Suppose there be Vacuum in that Air into which the Marble you pull off is to succeed, shall there be no Vacuum in the Air that was round about the two Marbles when they touched? Why cannot that Vacuum come into the place between? Air cannot succeed in an instant, because a body; and consequently cannot be moved through the least space in an instant. But emptiness is not a body, nor is moved, but made by the act it self of separation. There is therefore (if you admit Vacuum) no necessity at all for the Air to fill the space left, in an instant. And therefore, with what ease the Marble coming off presseth out the Vacuum of the Air behind it, with the same ease will the Marbles be pulled assunder. Seeing then, if there were Vacuum, there would be no difficulty of Separation; it follows, because there is difficulty of separation, that there is no Vacuum.

A.

Well now, supposing the world full, how do you prove it possible to pull those Marbles assunder?

B.

Take a piece of soft wax; Do not you think the one half touches the other half as close as the smoothest Marbles? yet you can pull them assunder. But how? still as you pull, the wax grows continually more and more slender; there being a perpetual parting or discession of the outermost part of the wax one from another; which the Air presently fills, and so there is a continual lessening of the wax, till it be no bigger than a hair, and at last separation. If you can do the same to a Pillar of Marble, till the outside give way, the effect will be the same, but much quicker, after it once begins to break in the Superficies; because the force that can master the first resistance of the hardness, will quickly dispatch the rest.

A.

It seems so by the brittleness of some hard bodies. But I shall afterward put some Questions to you, touching the nature of hardness. But now to return to our subject,

What reason can you render (without supposing Vacuum) of the effects produced in the Engine they use at Gresham Colledge?

B.

That Engine produceth the same effects, that a strong wind would produce in a narrow room.

A.

How comes the wind in? You know the Engine is a hollow round pipe of brass; into which is thrust a Cylinder of wood covered with Leather, and fitted to the Cylinder so exactly as no Air can possibly pass between the leather and the brass?

B.

I know it; and that they may thrust it up, there is a hole left in the Cylinder to let the Air out before it; which they can stop when they please. There is also in the bottom of the Cylinder a passage into a hollow Globe of Glass; which passage they can also open and shut at pleasure. And at the top of that Globe there is a wide mouth to put in what they please to try conclusions on; and that also to be opened and shut as shall be needful. 'Tis of the nature of a Pop-gun which Children use, but great, costly, and more ingenious. They thrust forward, and pull back the wooden Cylinder (because it requires much strength) with an Iron screw. What is there in all this to prove the possibility of Vacuum.

A.

Whan this wooden Cylinder covered with leather, fit and close is thrust home to the bottom, and the holes in the hollow Cylinder of Brass close stopped, how can it be drawn back, as with the screw they draw it, but that the space it leaves must needs be empty. For it is impossible that any Air can pass into the place to fill it?

B.

Truly I think it close enough to keep out Straw and Feathers, but not to keep out Air, nor yet matter. For suppose they were not so exactly close but that there were round about a distance for a small hair to lye between, Then

will the pulling back of the Cylinder of wood force so much Air in, as in retiring it forces back, and that without any sensible difficulty. And the Air will so much more swiftly enter as the passage is left more narrow. Or if they touch, and the contract be in some points, and not in all, the Air will enter as before in case the force be augmented accordingly. Lastly, though they touch exactly, if either the Leather yield, or the Brass (which it may do to the force of a strong screw) the Air will again enter. Do you think it possible to make two superficieses so exquisitely touch in all points as you suppose, or Leather so hard as not to yield to the force of a screw? The Body of Leather will give passage both to Air and Water, as you will confess when you ride in Rainy and Windy weather. You may therefore be assured that in drawing out their wooden-leather Cylinder they force in as much Air as will fill the place it leaves, and that with as much swiftness as is answerable to the strength that drives it in. The effect therefore of their pumping is nothing else but a vehement Wind, a very vehement Wind coming in on all sides of the Cylinder at once into the hollow of the Brass Pipe, and into the hollow of the Glass Globe joyned to it.

A.

I see the reason already of one of their wonders, which is, that the Cylinder they pump with, if it be left to it self, after it is pulled back will swiftly go up again. You will say the Air comes out again with the same violence by reflection; and I believe it?

B.

This is argument enough that the place was not empty. For what can fetch or drive up the Sucker, as they call it, if the place within were empty; for that there is any weight in the Air to do it, I have already demonstrated to be impossible.

Besides, you know, when they have sucked out (as they think) all the Air from the Glass Globe, they can nevertheless both see through it what is done, and hear a sound from within when there is any made. Which (if there were no other, but there are many other,) is argument enough that the place is still full of Air.

A.

What say you to the swelling of a Bladder even to bursting, if it be a little blown when it is put into the Receiver, (for so they call the Globe of Glass?)

B.

The stream of Air that from every side meeting together, and turning in an infinite number of small points, do pierce the Bladder in innumerable places with great violence at once, like so many invisible small wimbles; especially if the Bladder be a little blown before it be put in, that it may make a little resistance. And when the Air has once pierced it, it is easie to conceive, that it must afterward by the same violent motion be extended till it break. If before it break you let in fresh Air upon it, the violence of the motion will thereby be tempered, and the Bladder be less extended. For that also they have observed. Can you imagine how a Bladder should be extended, and broken, by being too full of Emptiness.

A.

How come living creatures to be killed in this Receiver, in so little a time as 3 or 4 minutes of an hour?

B.

If they suck into their lungs so violent a wind thus made, you must needs think it will presently stop the passage of their blood; and that is death; though they may recover if taken out before they be too cold. And so likewise will it put out fire; but the Coals taken out whilst they are hot, will revive again. 'Tis an ordinary thing in many Coal-pits, (whereof I have seen the experience,) that a wind proceeding from the sides of the Pit every way, will extinguish any fire let down into it, and kill the workmen, unless they be quickly taken out.

A.

If you put a vessel of water into the Receiver, and then suck out the Air, the water will boil. What say you to that?

B.

It is like enough it will dance in so great a bustling of the Air; but I never heard it would be hot. Nor can I imagine how Vacuum should make any thing dance. I hope you are by this time satisfied, that no experiment made with the Engine at Gresham Colledge, is sufficient to prove that there is, or that there may be Vacuum.

A.

The World you know is finite, and consequently, all that infinite space without it, is empty. Why may not some of that Vacuum be brought in, and mingled with the Air here?

B.

I know nothing in matters without the World.

A.

What say you to Torricellioes Experiment in Quick-silver, which is this. There is a Bason at A filled with Quick-silver, suppose to B, And CD a hollow glass pipe filled with the same. Which if you stop with your finger at B, and so set it upright, and then if you take away your finger, the Quick-silver will fall from C downwards, but not to the bottom. For it will stop by the way, suppose at D. Is it not therefore necessary that that space between C and D be left empty? Or will you say the Quick silver does not exactly touch the sides of the glass pipe?

B.

I'll say neither. If a man thrust down into a vessel of Quick-silver a blown Bladder, will not that Bladder come up to the top?

A.

Yes certainly, or a Bladder of Iron, or of any thing else but Gold.

B.

You see then that Air can pierce Quick-silver.

A.

Yes, with so much force as the weight of Quick-silver comes to.

B.

When the Quick-silver is fallen to D, there is so much the more in the bason. And that takes up the place which so much Air took up before. Whither can this Air go if all the World without that glass pipe B C were

full? There must needs be the same or as much Air come to that space (which only is empty) between C and D. By what force? By the weight of the Quick-silver between D and B. Which Quick-silver weigheth now upward; or else it could never have raised that part higher, which was at first in the Bason. So you see the weight of Quick-silver can press the Air through Quick-silver up into the pipe, till it come to an equality of force as in D. Where the weight of the Quick-silver is equal to the force which is required in Air to go through it.

A.

If a man suck a Vial that has nothing in it but Air, and presently dip the mouth of it into water, the water will ascend into the Vial. Is not that an argument that part of the Air had been sucked out, and part of the room within the Vial left empty?

B.

No. If there were empty space in the World, why should not there be also some empty space in the Vial before it was sucked? And then why does not the water rise to fill that, when a man sucks the Vial he draws nothing out neither into his Belly not into his Lungs, nor into his Mouth; only he sets the Air within the glass into a circular motion, giving it at once an endeavour to go forth by the sucking, and an endeavour to go back by not receiving it into his mouth. And so with a great deal of labour glues his lips to the neck of the Vial. Then taking it off, and dipping the neck of the Vial into the water before the circulation cease, the Air with the endeavour it hath now gotten, pierces the water and goes out. And so much Air as goes out, so much matter comes up into the room of it.

CHAP. III. PROBLEMS OF HEAT AND LIGHT.

A.

WHAT is the cause of Heat?

B.

How know you, that any thing is Hot but your self?

A.

Because I perceive by sense it Heats me.

B.

It is no good argument, The thing Heats me; therefore it is Hot. But what alteration do you find in your body at any time by being Hot?

A.

I find my skin more extended in Summer than in Winter; and am sometimes fainter and weaker then ordinary, as if my Spirits were exhaled; and I sweat.

B.

Then that is it you would know the cause of. I have told you before that by the motion I suppose both in the Sun, and in the Earth, the Air is dissipated, and consequently that there would be an infinite number of small

empty places but that the World being full, there comes from the next parts other Air into the spaces, they would else make empty. When therefore this motion of the Sun is excercised upon the Superficies of the Earth, if there do not come out of the Earth it self some corporal substance to supply that tearing of the Air, we must return again to the admission of Vacuum. If there do, then you see how by this motion fluid bodies are made to exhale out of the Earth. The like happens to a mans body or hand, which when he perceives, he says he is Hot. And so of the Earth when it sendeth forth Water and Earth together in Plants, we say it does it by Heat from the Sun.

A.

'Tis very probable, and no less probable, that the same action of the Sun, is that which from the Sea and moist places of the Earth, but especially from the Sea fetcheth up the water into the Clouds. But there be many ways of Heating besides the action of the Sun or of Fire. Two pieces of Wood will take Fire if in Torning they be prest together.

B.

Here again you have a manifest laceration of the Air by the reciprocal and contrary motions of the two pieces of wood, which necessarily causeth a coming forth of whatsoever is Aereal or fluid within them, and (the motion pursued) a dissipation also of the other more solid parts into Ashes.

A.

How comes it to pass that a man is warmed even to sweating almost with every extraordinary labour of his body?

B.

It is easie to understand, how by that labour all that is liquid in his body is tossed up and down, and thereby part of it also cast forth.

A.

There be some things that make a man Hot without sweat or other evaporation, as Caustiques, Nettles and other things.

B.

No doubt. But they touch the part they so Heat, and cannot work that effect at any distance.

A.

How does Heat cause light, and that partially in some bodies more, in some less, though the Heat be equal?

B.

Heat does not cause Light at all. But in many Bodies, the same cause, that is to say, the same motion causeth both together; so that they are not to one another as cause and effect, but are concomitant Effects, sometimes of one and the same motion.

A.

How?

B.

You know the rubbing or heard pressing of the Eye, or a stroke upon it makes an apparition of Light without and before it, which way soever you

look. This can proceed from nothing else but from the restitution of the Organ pressed or stricken, unto its former ordinary situation of parts. Does not the Sun by his thrusting back the Air upon you eyes press them? Or does not those bodies whereon the Sun shines (though by reflection) do the same, though not so strongly? And do not the Organs of Sight, the Eye, the Heart, and Brains resist that pressure by an endeavour of restitution outwards? Why then should there not be without and before the Eye, an apparition of Light in this case as well as in the other?

A.

I grant there must. But what is that which appears after the pressing of the eye? For there is nothing without, that was not there before; or if there were, methinks another should see it better, or as well as he; or if in the dark, methinks it should enlighten the place.

B.

It is a fancy, such as is the appearance of your face in a Looking-glass; such as is a Dream; such as is a Ghost; such as is a spot before the Eye that hath stared upon the Sun or Fire. For all these are of the Regiment of Fancy, without any body concealed under them, or behind them, by which they are produced.

A.

And when you look towards the Sun or Moon, why is not that also which appears before your Eyes at that time a fancy?

B.

So it is. Though the Sun it self be a real Body, yet that bright Circle of about a foot Diameter cannot be the Sun, unless there be two Suns, a greater and a lesser. And because you may see that which you call the Sun, both above you in the Skie, and before you in the Water, and two Suns (by distorting your Eye) in two places of the Skie, one of them must needs be Fancy. And if one, both. All sense is Fancy though the cause be always in a real Body.

A.

I see by this that those things which the Learned call the Accidents of Bodies, are indeed nothing else but diversity of Fancy; and are inherent in the Sentient, and not in the Objects, except Motion and Quantity. And I perceive by your Doctrine you have been tampering with Leviathan. But how comes Wood with a certain degree of Heat to shine, and Iron also with a greater degree; but no Heat at all to be able to make water shine?

B.

That which shineth hath the same Motion in its parts that I have all this while supposed in the Sun and Earth. In which Motion there must needs be a competent degree of swiftness, to move the sense, that is, to make it visible. All Bodies that are not fluid will shine with Heat, if the Heat be very great. Iron will shine and Gold will shine; but water will not, because the parts are carried away before they attain to that degree of swiftness; which is requisite.

A.

There are many fluid Bodies, whose parts evaporate, and yet they make a flame, as Oyl, and Wine, and other strong drinks:

B.

As for Oyl I never saw any inflamed by it self; how much soever Heated, therefore I do not think they are the parts of the Oyl, but of the combustible body oyled that shine, but the parts of Wine and strong Drinks have partly a strong Motion of themselves, and may be made to shine, but not with boiling, but by adding to them as they rise the flame of some other body.

A.

How can it be known that the particles of Wine have such a Motion as you suppose?

B.

Have you ever been so much distempered with drinking Wine, as to think the Windows and Table move?

A.

I confess (though you be not my Confessor,) I have, but very seldom, and I remember the window seemed to go and come in a kind of circling Motion, such as you have described. But what of that?

B.

Nothing, but that it was the Wine that caused it; which having a good degree of that Motion before, did when it was Heated in the Veins, give that concussion (which you thought was in the window,) to the Veins themselves, and (by the continuation of the parts of mans Body) to the Brain; and that was it which made the window seem to move.

A.

What is Flame? For I have often thought the Flame that comes out of a small heap of Straw, to be more (before it hath done Flaming,) then a hundred times the Straw it self.

B.

It was but your Fancy. If you take a stick in your hand by one end, the other end burning, and move it swiftly, the burning end, if the Motion be circular, shall seem a circle; if streight, a streight line of Fire, longer or shorter, according to the swiftness of the Motion, or to the space it moves in. You know the cause of that.

A.

I think it is, because the impression of that visible Object, which was made at the first instant of the Motion did last till it was ended. For then it will follow that it must be visible all the way, the impressions in all points of the time being equal.

B.

The cause can be no other. The smallest spark of Fire flying up seems a line drawn upward; and again by that swift circular Motion which we have supposed for the cause of Light, seems also broader then it is. And consequently the Flame of every thing must needs seem much greater then it is.

A.

What are those sparks that flie out of the Fire?

B.

They are small pieces of the wood or Coals, or other Fuel loosened and carried away with the Air that cometh up with them. And being extingished before their parts be quite dissipated into others, are so much Soot, and black, and may be fired again.

A.

A Spark of Fire may be stricken out of a cold stone. It is not therefore Heat that makes this shining.

B.

No 'Tis the Motion that makes both the Heat and shining; and the stroke makes the Motion. For every of those Sparks, is a little parcel of the stone, which swiftly moved, imprinteth the same Motion into the matter prepared, or receive it.

A.

How comes the Light of the Sun to burn almost any combustibile matter by rerefraction through a convex glass, and by reflection from a concave?

B.

The Air moved by the Sun presseth the convex glass in such manner as the action continued through it, proceedeth not in the same streight line by which it proceeded from the Sun, but tendeth more toward the center of the body it enters. Also when the action is continued through the convex body it bendeth again the same way. By which means the whole action of the Sun-beams are enclosed within a very small compass; in which place therefore

there must be a very vehement Motion; and consequently if there be in that place combustible matter, such as is not very hard kindle, the parts of it will be dissipated, and receive that Motion which worketh on the Eye as other Fire does.

The same reason is to be given for burning by Reflection. For there also the Beams are collected into almost a point.

A.

Why may not the Sun-beams be such a Body as we call Fire, and pass through the pores of the glass so disposed as to cary them to a point, or very near?

B.

Can there be a glass that is all pores; If there cannot, then cannot this effect be produced by the passing of Fire through the pores. You have seen men light their Tobacco at the Sun with a burning glass, or with a ball of Cristal, held which way they will indifferently. Which must be impossible, unless the ball were all pores. Again, neither you nor I can conceive any other Fire then we have seen, nor then such as water will put out. But not only a solid Globe of Glass or Cristal will serve for a burning Glass, but also a hollow one filled with water. How then does the Fire from the Sun pass through the glass of water without being put out before it come to the matter they would have it burn?

A.

I know not. There comes nothing from the Sun. If there did, there is come so much from it already, that at this day we had had no Sun,

CHAP. V. PROBLEMS OF HARD AND SOFT.

A.

WHAT call you Hard, and what Soft.

B.

That body whereof no one part is easily put out of its place, without removing the whole, is that which I and all men call Hard; and the contrary Soft. So that they, are but degrees one of another.

A.

What is the cause that makes one body Harder then another, or (seeing you say they are but degrees of one another) what makes one body Softer then another, and the same body sometimes Harder, sometimes Softer?

B.

The same Motion which we have supposed from the beginning for the cause of so many other effects. Which Motion not being upon the center of the part moved, but the part it self going in another circle to and again, it is not necessary that the Motion be perfectly circular. For it is not circulation, but the reciprocation, I mean the to and again that does cast off, and lacerrate the Air, and consequently produce the fore-mentioned effects.

For the cause therefore of Hardness, I suppose the reciprocation of Motion in those things which are Hard, to be very swift, and in very small

circles.

A.

This is somewhat hard to believe. I would you could supply it with some visible experience.

B.

When you see (for example) a Cross-bow bent, do you think the parts of it stir?

A.

No. I am sure they do not.

B.

How are you sure? You have no argument for it, but that you do not see the Motion. When I see you sitting still, must I believe there is no Motion in your parts within, when there are so many arguments to convince me there is.

A.

What argument have you to convince me that there is Motion in a Cross-bow when it stands bent?

B.

If you cut the string, or any way set the Bow at liberty it will have then a very visible Motion. What can be the cause of that?

A.

Why the setting of the Bow at liberty.

B.

If the Bow had been crooked before it was bent, and a string tied to both ends, and then cut asunder, the Bow would not have stir'd. Where lies the difference?

A.

The Bow bent has a Spring; unbent it has none, how crooked soever.

B.

What mean you by Spring?

A.

An endeavour of restitution to it's former posture.

B.

I understand Spring as well as I do endeavour.

A.

I mean a Principle or beginning of Motion in a contrary way to that of the force which bent it.

B.

But the beginning of Motion is also Motion, how insensible soever it be. And you know that nothing can give a beginning of Motion to it self. What is it therefore that gives the Bow (which you say you are sure was at rest when it stood bent) its first endeavour to return to its former posture?

A.

It was he that bent it.

B.

That cannot be. For he gave it an endeavour to come forward, and the Bow endeavours to go backward.

A.

Well, grant that endeavour be Motioun, and Motion in the Bow unbent, how do you derive from thence, that being set at liberty it must return to its former posture?

B.

Thus There being within the Bow a swift (though invisible) Motion of all the parts, and consequently of the whole; the bending causeth that Motion, which was along the Bow (that was beaten out when it was bent into that length) to operate across the length in every part of it, and the more by how much it is more bent; and consequently endeavours to unbend it all the while it stands bent. And therefore when the force which kept it bent is removed, it must of necessity return to the posture it had before.

A.

But has that endeavour no effect at all before the impediment be removed? For if endeavour be Motion, and every Motion have some effect more or less, methinks this endeavour should in time produce something.

B.

So it does. For in time (in a long time) the course of this internal Motion will lie along the Bow, not according to the former, but to the new acquired posture. And then it will be as uneasie to return it to its former posture, as it was before to bend it.

A.

That's true. For Bows long bent lose their appetite to restitution, long custom becoming nature. But from this internal reciprocation of the parts, how do you infer the Hardness of the whole Body.

B.

If you apply force to any single part of such a body, you must needs disorder the Motion of the next parts to it before it yield, and there disordered, the Motion of the next again must also be disordered; and consequently no one part can yield without force sufficient to disorder all. But then the whole body must also yield. Now when a body is of such a nature as no single part can be removed without removing the whole, men say that body is Hard.

A.

Why does the Fire melt divers Hard bodies, and yet not all?

B.

The hardest bodies are those wherein the Motion of the parts are the most swift, and yet in the least circles.

Wherefore if the Fire, the Motion of whose parts are swift, and in greater circles, he made so swift, as to be strong enough to master the Motion of the parts of the Hard body, it will make those parts to move in a greater compass, and thereby weaken their resistance, that is to say, Soften them, which is a degree of liquefaction. And when the Motion is so weakened, as that the parts lose their coherence by the force of their own weight, then we count the body melted.

A.

Why are the Hardest things the most brittle, insomuch that what force soever is enough to bend them, is enough also to break them?

B.

In bending a Hard body, as (for example) a Rod of Iron, you do not enlarge the space of the internal Motion of the parts of Iron, as the Fire does; but you master and interrupt the Motion, and that chiefly in one place. In which place the Motion that makes the Iron Hard being once overcome, the prosecution of that bending must needs suddenly master the Motions of the parts next unto it, being almost mastered before.

A.

I have seen a small piece of glass, the figure whereof is this A A B C. Which piece of glass if you bend toward to top, as in C, the whole body will shatter asunder into a Million of pieces, and be like to so much dust. I would fain see you give a probable reason of that.

B.

I have seen the Experiment. The making of the glass, is thus, They dip an Iron Rod into the molten glass that stands in a Vessel within the Furnace. Upon which Iron Rod taken out, there will hang a drop of molten but tough Mettal of the figure you have described, which they let fall into the water. So that the main drop comes first to the water, and after it the tail, which though streight whilst it hung on the end of the Rod, yet by falling into the water becomes crooked. Now you know the making of it, you may consider what must be the consequence of it. Because the main drop A comes first to the water, it is therefore first quenched, and consequently that the Motion of the parts of that drop, which by the Fire were made to be moved in a larger compass, is by the water made to shrink into lesser circles towards the other end B, but with the same or not much less swiftness.

A.

Why so?

B.

If you take any long piece of Iron, Glass, or other uniform and continued body; and having Heated one end thereof, you hold the other end in your hand, and so quench it suddenly, though before, you held it easily enough, yet now it will burn your fingers.

A.

It will so.

B.

You see then how the Motion of the parts from A toward C is made more violent and in less compass by quenching the other parts first. Besides, the whole Motion that was in all the parts of the main drop A, is now united in the small end B C. And this I take to be the cause why that small part B C is so exceeding stiff. Seeing also this Motion in every small part of the glass, is not only circular, but proceeds also all along the glass from A to B, the whole Motion compounded will be such as the Motion of Spinning any Soft matter unto Thread, and will dispose the whole body of the glass in Threads, which in other Hard bodies are called the grain.

Therefore if you bend this body (for example) in C (which to do will require more force then a man would think that has not tryed) those threads of Glass must needs be all bent at the same time, and stand so, till by the breaking of the Glass at C, they be all at once set at liberty. And then all at once being suddenly unbent, like so many brittle, and over-bent Bows, their Strings breaking, be shivered in pieces.

A.

'Tis like enough to be so. And if nature have betrayed her self in any thing, I think it is in this, and in that other experience of the Cross-bow; which strongly and evidently demonstrates the internal reciprocation of the Motion, which you suppose to be in the internal parts of every Hard body. And I have observed somewhat in Looking-glasses which much confirms that there is some such Motion in the internal parts of Glass, as you have supposed for the cause of Hardness. For let the Glass be A B, and let the Object at C be a Candle, and the Eye at D. Now by divers Reflections and Refractions in the two superficies of the Glass, if the Lines of Vision be very oblique, you shall see many images of the Candle, as E, F, G, in such order and position as is here described. But if you remove your Eye to C, and the Candle to D, they will appear in a situation manifestly different

from this. Which you will yet more plainly perceive if the Looking-Glass be coloured, as I have observed in Red and Blue Glasses; and could never conceive any probable cause of it, till now you tell me of this secret Motion of the parts across the grain of the Glass, acquired by cooling it this or that way.

B.

There be very many kinds of Hard bodies, Metals, Stones, and other kinds in the bowels of the Earth, that have been there ever since the beginning of the World; and I believe also many different sorts of Juices that may be made Hard. But for one general cause of Hardness it can be no other than such an internal Motion of parts as I have already described, whatsoever may be the cause of the several concomitant qualities of their Hardness in particular.

A.

We see water Hardened every Frosty day. It's likely therefore you may give a probable cause of Ice. What is the cause of Freezing of the Ocean towards the Poles of the Earth?

B.

You know the Sun being always between the Tropicks, and (as we have supposed) always casting off the Air; and the Earth likewise casting it off from it's self, there must needs on both sides be a great Stream of Air towards the Poles, shaving the superficies of the Earth and Sea, in the Northern and Southern Climates. This shaving of the Earth and Sea by the Stream of Air must needs contract and make to shrink those little Circles of the internal parts of Earth and Water, and consequently Harden them, first at

the superficies, into a thin skin, which is the first Ice; and afterwards the same Motion continuing, and the first Ice co-operating, the Ice becomes thicker. And this I conceive to be the cause of the Freezing of the Ocean.

A.

If that be the cause, I need not ask how a Bottle of water is made to Freeze in warm weather with Snow, or Ice mingled with Salt. For when the Bottle is in the midst of it, the Wind that goeth out both of the Salt and of the Ice as they dissolve, must needs shave the superficies of the Bottle, and the Bottle work accordingly on the water without it, and so give it first a thin skin, and at last thicken it into a solid piece of Ice. But how comes it to pass that water does not use to Freeze in a deep Pit?

B.

A deep Pit is a very thick Bottle, and such as the Air cannot come at but only at the top, or where the Earth is very loose and spungy.

A.

Why will not Wine Freeze as well as Water?

B.

So it will when the Frost is great enough. But the internal Motion of the parts of Wine and other Heating Liquors is in greater Circles and stronger then the Motion of the parts of water; and therefore less easily to be Frozen, especally quite through, because those parts that have the strongest Motion retire to the center of the Vessel.

CHAP. VI. PROBLEMS OF RAIN, WIND, AND OTHER WEATHER.

A.

WHAT is the original cause of Rain? and how is it generated?

B.

The motion of the Air (such as I have described to you already) tending to the dis-union of the parts of the Air, must needs cause a continual endeavour (there being no possibility of Vacuum) of whatsoever fluid parts there are upon the face of the Earth and Sea, to supply the place which would else be empty.

This makes the water, and also very small and loose parts of the Earth and Sea to rise, and mingle themselves with the Air, and to become mist and Clouds. Of which the greatest quantity arise there, where there is most water, namely, from the large parts of the Ocean; which are the South Sea, the Indian Sea, and the Sea that divideth Europe and Africa from America; over which the Sun, for the greatest part of the year is perpendicular, and consequently raiseth a greater quantity of water. Which afterwards gathered into Clouds, falls down in Rain.

A.

If the Sun can thus draw up the water; though but in small drops, why can it not as easily hold it up?

B.

It is likely it would also hold them up, if they did not grow greater by meeting together, nor were carried away by the Air towards the Poles.

A.

What makes them gather together?

B.

It is not improbable that they are carried against Hills, and there stopt till more overtake them. And when they are carried towards the North or South where the force of the Sun is more oblique and thereby weaker, they descend gently by their own weight. And because they tend all to the center of the Earth, they must needs be united in their way for want of room, and so grow bigger. And then it Rains.

A.

What is the reason it Rains so seldom, but Snows so often upon very high Mountains?

B.

Because perhaps when the water is drawn up higher then the highest Mountains, where the course of the Air between the Aequator and the Poles is free from stopping, the Stream of the Air Freezeth it into Snow. And 'tis in those places only where the Hills shelter it from that Stream, that it falls in Rain.

A.

Why is there so little Rain in Egypt, and yet so much in other parts nearer the Aequinoctial, as to make the Nile overflow the Countrey?

B.

The cause of the falling of Rain, I told you was the the stopping, and consequently the collection of Clouds about great Mountains, especially when the Sun is near the Aequinoctial, and thereby draws up the water more potently, and from greater Seas. If you consider therefore that the Mountains in which are the springs of Nile, lye near the Aequinoctial and are exceeding great, and near the Indian Sea, you will not think it strange there should be great store of Snow. This as it melts makes the Rain of Nile to rise, which in April and May going on toward Egypt arrived there about the time of the Solstice, and overflow the Countrey.

A.

Why should not the Nile then overflow that Countrey twice a year? For it comes twice a year to the Aequinoctial.

B.

From the Autumnal Aequinox, the Sun goeth on toward the Southern Tropique. And therefore cannot dissolve, the Snow on that side of the Hills that look towards Egypt.

A.

But then there ought to be such another Innundation Southward.

B.

No doubt but there is a greater descent of water there in their Summer then at other times; as there must be wheresoever there is much Snow melted. But what should that innundate, unless it should overflow the Sea that comes close to the foot of those Mountains? And for the cause why it seldom Rains in Egypt, it may be this, That there are no very high Hills near it to collect the Clouds. The Mountains whence Nile riseth being near 2000 Miles off. The nearest on one side are the Mountains of Nubia, and on the other side Sina, and the Mountains of Arrabia.

A.

Whence think you proceed the Winds?

B.

From the Motion (I think) especially of the Clouds, partly also from whatsoever is moved in the Air.

A.

It is manifest, that the Clouds are moved by the Winds; so that there were Winds before any clouds could be moved. Therefore I think you make the Effect before the Cause.

B.

If nothing could move a Cloud but Wind, your objection were good. But you allow a Cloud to descend by it's own weight. But when it so descends, it must needs move the Air before it, even to the Earth, and the Earth again repel it, and so make lateral Winds every way. Which will carry forwards other Clouds if there be any in their way, but not the Cloud that made them

The Vapour of the water rising into Clouds, must needs also as they rise, raise a Wind?

A.

I grant it. But how can the slow motion of a Cloud make so swift a Wind as it does?

B.

It is not one or two little Clouds, but many and great ones that do it. Besides, when the Air is driven into places already covered; it cannot but be much the swifter for the narrowness of the passage

A.

Why does the South Wind more often then any other bring Rain with it?

B.

Where the Sun hath most power, and where the Seas are greatest, that is in the South, there is most water in the Air; which a South wind can only bring to us. But I have seen great showers of Rain sometimes also when the wind hath been North, but it was in Summer, and came first, I think, from the South or West, and was but brought back from the North.

A.

I have seen at Sea very great Waves when there was no Wind at all. What was it then that troubled the Water?

B.

But had you not Wind enough presently after?

A.

We had a Storm within a little more then a quarter of an hour after.

B.

That Storm was then coming and had moved the Water before it. But the Wind you could not perceive, for it came downwards with the descending of the Clouds, and pressing the Water bounded above your Sail till it came very near. And that was it that made you think there was no Wind at all.

A.

How comes it to pass that a Ship should go against the Wind which moves it, even almost point blank, as if it were not driven but drawn?

B.

You are to know first, that what Body soever is carryed against another Body, whether perpendicularly, or obliquely, it drives it in a perpendicular to the superficies it lighteth on. As for Example, a Bullet shot against a flat wall, maketh the Stone (or other matter it hits) to retire in a perpendicular to that flat; or, if the Wall be round, towards the center, that is to say, perpendicularly. For if the way of the motion be oblique to the Wall, the motion is compounded of two motions, one parrallel to the Wall, and the other perpendicular. By the former whereof the Bullet is carried along the Wall side, by the other it approacheth to it. Now the former of these motions can have no effect upon it; all the battery is from the motion perpendicular, in which it approacheth. And therefore the part it hits must also retire perpendicularly. If it were not so, a Bullet with the same swiftness would

execute as much obliquely shot, as perpendicularly; which you know it does not.

A.

How do you apply this to a Ship?

B.

Let A. B. be the Ship, the head of it A. If the Wind blow just from A. towards B. 'tis true, the Ship cannot go forward howsoever the sail be set. Let C. D. be perpendicular to the Ship, and let the Sail E. C. be never so little oblique to it, and F. C. perpendicular to E. C. and then you see the Ship will gain the space D. F. to the headward.

A.

It will so, but when it is very near to the Wind it will go forward very slowly, and make more way with her side to the Leeward.

A.

It will indeed go slower in the proportion of the Line A. E. to the Line C. E. But the Ship will not go so fast as you think sideward: One is the force of that Wind which lights on the side of the Ship it self; the other is, the bellying of the Sail; for the former, it is not much because the Ship does not easily put from her the Water with her side; and bellying of the Sail, gives some little hold for the Wind to drive the Ship a stern.

A.

For the motion sideward I agree with you; but I had thought the bellying of the Sail, had made the Ship go faster.

B.

But it does not; only in a fore-wind it hinders least.

A.

By this reason a broad thin Board should make the best Sail.

B.

You may easily foresee the great incommodities of such a Sail. But I have seen tryed in little what such a Wind can do in such a case. For I have seen a Board set upon four truckles, with a staff set up in the midst of it for a Mast, and another very thin and broad Board fastned to that staff in the stead of a Sail; and so set as to receive the Wind very obliquely, I mean so as to be within a point of the Compass directly opposite to it; and so placed upon a reasonable smooth pavement where the Wind blew somewhat strongly. The event was first, that it stood doubting whether it should stir at all or no, but that was not long; and then it ran a head extream swiftly, till it was overthrown by a Rub.

A.

Before you leave the Ship tell me how it comes about that so small a thing as a Rudder, can so easily turn the greatest Ship?

B.

'Tis not the Rudder only, there must also be a stream to do it; you shall never turn a Ship with a Rudder in a standing pool, nor in a natural current.

You must make a stream from head to stern, either with Oars or with Sails: when you have made such a stream, the turning of the Rudder obliquely holds the Water from passing freely; and the Ship or Boat cannot go on directly, but as the Rudder inclines to the stern, so will the Ship turn. But this is too well known to insist upon: you have observed, that the Rudders of the greatest Ships are not very broad, but go deep into the Water, whereas Western Barges, though but small Vessels, have their Rudders much broader, which argues that the holding of Water from passing is the office of a Rudder: and therefore to a Ship that draws much Water the Rudder is made deep accordingly, and in Barges that draw little Water, the Rudders as less deep, must so much the more be extended in breadth.

A.

What makes Snow?

B.

The same cause which (speaking of Hardness) I supposed for the cause of Ice. For the Stream of Air proceeding from. That both the Earth and the Sun cast off the Air, and consequently maketh a stream of Air from the Aequinoctial towards the Poles, passing amongst the Clouds, shaving those small drops of Water whereof the Clouds consist, and congeals them as they do the Water of the Sea, or of a River. And these small frozen drops are that which we call Snow.

A.

But then how are great drops frozen into Hailstones, and that especially (as we see they are) in Summer?

B.

It is especially in Summer; and hot weather, that the drops of Water which make the Clouds, are great enough; but it is then also that Clouds are sooner and more plentifully carryed up. And therefore the current of the Air strengthened between the Earth and the Clouds, becomes more swift; and thereby freezeth the drops of Water, not in the Cloud it self, but as they are falling. Nor does it freeze them throughly, the time of their falling not permitting it, but gives them only a thin coat of Ice; as is manifest by their suddain dissolving.

A.

Why are not sometimes also whole Clouds when pregnant and ready to drop, frozen into one piece of Ice?

B.

I belive they are so whensoever it Thunders.

A.

But upon what ground do you believe it?

B.

From the manner or kind of noise they make, namely a crack; which I see not how it can possibly be made by Water or any other soft Bodies whatsoever.

A.

Yes, the Powder they call Aurum Fulminans, when thoroughly warm, gives just such another crack as Thunder.

B.

But why may not every small grain of that Aurum Fulminans by it self be heard, though a heap of them together be soft, as is any heap of Sand. Salts of all sorts are of the nature of Ice. But Gold is dissolved into Aurum Fulminans by Nitre and other Salts. And the least grain of it gives a little crack in the fire by it self. And therefore when they are so warmed by degrees, the crack cannot chuse but be very great.

A.

But before it be Aurum Fulminans they use to wash away the Salt (which they call dulcifying it,) and then they dry it gently by degrees.

B.

That is, they exhale the pure Water that is left in the Powder, and leave the Salt behind to Harden with drying. Other Powder made of Salts without any Gold in them will give a crack as great as Aurum Fulminans. A very great Chymist of our times hath written, that Salt of Tarter, Salt-peter, and a little Brimstone ground together into a Powder, and dried, a few grains of that Powder will be made by the fire to give as great a Clap as a Musquet.

A.

Me thinks it were worth your tryal to see what effect a Quart or a Pint of Aurum Fulminans would produce, being put into a great Gun made strong

enough on purpose, and the Breech of the Gun set in hot Cinders, so as to heat by degrees, till the Powder fly.

B.

I pray you try it your self; I cannot spare so much Money.

A.

What is it that breaketh the Clouds when they are frozen?

B.

In very hot weather the Sun raiseth from the Sea and all moist places abundance of Water, and to a great height. And whilst this Water hangs over us in Clouds, or is again descending, it raiseth other Clouds, and it hapens very often that they press the Air between them, and squeeze it through the Clouds themselves very violently; which as it passes shaves and hardens them in the manner declared.

A.

That has already been granted, my question is what breaks them?

B.

I must here take in one supposition more.

A.

Then your Basen (it seems) holds not all you have need of.

B.

It may for all this, for the supposition I add is no more but this; that what internal motion I ascribe to the Earth, and other the Concrete parts of the World, is to be supposed also in every of their parts how small soever; for what reason is there to think, in case the whole Earth have in truth the motion I have ascribed to it, that one part of it taken away, the remaining part should lose that motion. If you break a Load-stone both parts will retain their vertue, though weakened according to the diminution of their quantity; I suppose therefore in every small part of the Earth, the same kind of motion, which I have supposed in the whole: and so I recede not yet from my Basen.

A.

Let it be supposed, and withall, that abundance of Earth (which I see you aim at,) be drawn up together with the Water. What then?

B.

Then if many pregnant Clouds, some ascending and some descending meet together, and make concavities between, and by the pressing out of the Air, as I have said before, become Ice; those Atomes (as I may call them) of Earth will be by the straining of the Air through the water of the Clouds, be left behind, and remain in the Cavities of the Clouds, and be more in number then for the proportion of the Air therein. Therefore for want of liberty they must needs jostle one another, and become (as they are more and more streightened of room) more and more swift, and consequently at last break the Ice suddenly and violently, now in one place, and by and by in another; and make thereby so many claps of Thunder, and so many Flashes of Lightning. For the Air Recoiling upon our Eyes, is that which maketh those Flashes to our Fancy.

A.

But I have seen Lightning in a very clear Evening, when there has been neither Thunder nor Clouds.

B.

Yes in a clear evening; because the Clouds and the Rain were below the Horison, perhaps 40 or 50 Miles off; so that you could not see the Clouds nor hear the Thunder.

A.

If the Clouds be indeed Frozen into Ice, I shall not wonder if they be sometimes also so scituated, as (like Looking-Glasses) to make us see sometimes three or more Suns by Refraction and Reflection.

**CHAP. VII. PROBLEMS OF MOTION PERPENDICULAR,
OBLIQUE; OF PRESSION AND PERCUSSION;
REFLECTION AND REFRACTION; ATTRACTION AND
REPULSION.**

IF A BULLET from a certain point given, be shot against a wall Perpendicularly and again from the same Point Oblique, What will be the proportion of the Forces wherewith they urge the wall?

For Example, let the wall be A B, a point given E, a Gun C E that carries the Bullet Perpendicularly to F, and another Gun D E that carries the like Bullet with the same swiftness Oblique to G; In what proportion will their Forces be upon the Wall?

B.

The force of the stroke Perpendicular from E to F will be greater then the Oblique force from E to G, in the proportion of the line E G to the line E F.

A.

How can the difference be so much? Can the Bullet lose so much of its force in the way from E to G?

B.

No we will suppose it loseth nothing of its swiftness. But the cause is, That their swiftness being equal, the one is longer in coming to the wall then the other, in Proportion of Time, as E G to E F. For though their

swiftness be the same considered in themselves, yet the swiftness of their approach to the wall is greater in E F then in E G, in proportion of the lines themselves.

A.

When a Bullet enters not, but rebounds from the wall, does it make the same Angle going off, which it did falling on, as the Sun-beams do?

B.

If you measure the Angles close by the wall there difference will not be ensible; otherwise it will be great enough, For the Motion of the Bullet grows continually weaker. But it is not so with the Sun-beams which press continually and equally.

A.

What is the cause of Reflection? When a body can go no further on, it has lost its Motion. Whence then comes the Motion by which it reboundeth?

B.

This Motion of rebounding or reflecting proceedeth from the resistance. There is a difference to be considered between the Reflection of Light, and of a Bullet, answerable to their different Motions, pressing and striking. For the action which makes Reflection of Light, is the Pressure of the Air upon the Reflecting Body, caused by the Sun, or other shining body, and is but a contrary endeavour; as if two men should press with their breasts upon the two ends of a Staff, though they did not remove one another, yet they would find in themselves a great disposition to press backward upon whatsoever is

behind them, though not a total going out of their places. Such is the way of Reflecting Light. Now, when the falling on of the Sun-beams is Oblique, the action of them is nevertheless Perpendicular to the Superficies it falls on. And therefore the Reflecting Body, by resisting, turneth back that Motion Perpendicularly, as from F to E, but taketh nothing from the force that goes on parallel in the line of E H; because the Motion never presses. And thus of the two Motions from F to E, and from E to H is a compounded Motion in the line F H, which maketh an Angle in B G, equal to the Angle F G E.

But in Percussion (which is the Motion of the Bullet against a wall,) the Bullet no sooner goeth off then it loseth of its swiftness, and inclineth to the Earth by its weight. So that the Angles made in falling on and going off, cannot be equal, unless they be measured close to the point where the stroke is made.

A.

If a man set a Board upright upon its edge, though it may very easily be cast down with a little Pressure of ones finger, yet a Bullet from a Musquet shall not throw it down but go through it. What is the cause of that?

B.

In pressing with your finger you spend time to throw it down. For the Motion you give to the part you touch is communicated to every other part before it fall. For the whole cannot fall till every part be moved. But the stroke of a Bullet is so swift, as it breaks through before the Motion of the part it hits can be communicated to all the other parts that must fall with it.

A.

The stroke of a Hammer will drive a Nail a great way into a piece of Wood on a sudden. What weight laid upon the head of a Nail, and in how much time will do the same? It is a question I have heard propounded amonst Naturalists,

B.

The different manner of the operation of weight from the operation of a stroke, makes it uncalculable. The suddenness of the stroke upon one point of the wood takes away the time of resistance from the rest. Therefore the Nail enters so far as it does. But the weight not only gives them time, but also augments the resistance; but how much, and in how much time, is (I think) impossible to determine.

A.

What is the difference between Reflection and Recoiling?

B.

Any Reflection may (and not improperly) be called recoiling; but not contrariwise every Recoiling Reflection. Reflection is always made by the Re-action of a Body prest or stricken; but Recoiling not always. The Recoiling of a Gun is not caused by its own pressing upon the Gun-powder, but by the force of the Powder it self, inflamed and moved every way alike:

A.

I had thought it had been by the sudden re-entring of the Air after the flame and Bullet were gone out. For it is impossible that so much room as is left empty by the discharging of the Gun, should be so suddenly filled with the Air that entereth at the Touch-hole.

B.

The flame is nothing but the Powder it self, which scattered into its smallest parts seems, of greater bulk by much, then in truth it is, because they shine. And as the parts scatter more and more, so still more Air gets between them, entring not only at the Touch-hole, but also at the mouh of the Gun. which two ways being opposite, it will be much too weak to make the Gun Recoil.

A.

I have heard that a great Gun charged too much or too little, will Shoot (not above, nor below but) besides the mark; and charged with one certain charge between both will hit it.

B.

How that should be I cannot imagine. For when all things in the cause are equal, the effects cannot be unnequal. As soon as Fire is given, and before the Bullet be out, the Gun begins to Recoil. If then there be any unevenness or rub in the ground more on one side then on the other, it shall shoot besides the mark, whether too much, or too little, or justly charged; because if the line wherein the Gun Recoileth decline, the way of the Bullet will also decline to the contrary side of the mark. Therefore I can imagine no cause of this event, but either in the ground it Recoils on, or in the unequal weight of the parts of the Breech.

A.

How comes Refractin?

B.

When the action is in a line Perpendicular to the superficies of the Body wrought upon, there will be no Refraction at all. The action will proceed still in the same straight Line, whether it be Pression as in Light, or in Percussion as in the shooting of a Bullet. But when the Pression is Oblique, then will the Refraction be that way which the Nature of the Bodies through which the Action proceeds shall determin.

H.

How is light Refracted?

B.

If it pass through a Body of less, into a Body of greater resistance, and to the Point of the Superficies it falleth on, you draw a Line Perpendicular to the same superficies, the Action will proceed not in the same Line by which it fell on, but in another Line bending toward that Perpendiculare.

A.

What is the reason of that?

B.

I told you before, that the falling on worketh only in the Perpendicular; But as soon as the Action proceedeth further inward then a meer touch, it worketh partly in the Perpendicular, and partly forward, and would proceed in the same line in which it fell on, but for the greater resistance which now weakneth the Motion forward, and makes it to incline towards the Perpendicular.

A.

In transparent Bodies it may be so; but there be Bodies through which the Light cannot pass at all.

B.

But the Action by which Light is made, passeth through all Bodies. For this Action is Pression; and whatsoever is prest, presseth that which is next behind, and so continually. But the cause why there is no Light seen through it, is the unevenness of the parts within, whereby the Action is by an infinite number of Reflections so diverted and weakned, that before it hath proceeded through, it hath not strength left to work upon the Eye strongly enough to produce sight.

A.

If the Body being transparent the Action proceed quite through, into a Body again of less resistance, as out of Glass into the Air, which way shall it then proceed in the Air?

B.

From the Point where it goeth forth, draw a Perpendicular to the superficies of the Glass, the Action now freed from the resistance it suffered, will go from that Perpendicular, as much as it did before come towards it.

A.

When a Bullet from out of the Air entreth into a Wall of Earth, will that also be Refracted towards the Perpendicular?

B.

If the Earth be all of one kind, it will. For the parallel Motion, will there also at the first entrance be resisted, which it was not before it entred.

A.

How then comes a Bullet, when shot very Obliquely into any broad Water, and having entred, yet to rise, again into the Air?

B.

When a Bullet is shot very Obliquely, though the Motion be never so swift, yet approach downwards to the Water is very slow, and when it cometh to it, it casteth up much Water before it, which with its weight presseth downwards again, and maketh the Water to rise under the Bullet with force enough to master the weak Motion of the Bullet downwards, and to make it rise in such manner as Bodies use to rise by Reflection.

A.

By what Motion (seeing you ascribe all Effects to Motion) can a Load-stone draw Iron to it?

B.

By the same Motion hitherto supposed. But though all the smallest parts of the Earth have this Motion, yet it is not supposed that their Motions are in equal Circles; nor that they keep just time with one another; nor that they have all the same Poles. If they had, all Bodies would draw one another alike. For such an agreement of Motion, of Way, of Swiftnes, of Poles, cannot be maintained without the conjunction of the Bodies themselves in the Center of their common Motion, but by violence.

If therefore the Iron have but so much of the Nature of the Load-stone as redily to receive from it the like Motion, as one String of a Lute doth from another String strained to the same Note (as it is like enough it hath, the Load-stone being but one kind of Iron Ore) it must needs after that Motion received from it, (unless the greatness of the weight hinder) come nearer to it, because at distance their Motions will differ in time, and oppose each other whereby they will be forced to a common Center. If the Iron be lifted up from the Earth, the Motion of the Load-stone must be stronger, or the Body of it nearer, to overcome the Weight; and then the Iron will leap up to the Load-stone as Swiftly as from the same distance, it would fall down to the Earth; but if both the Stone and the Iron be set floating upon the Water, the attraction will begin to be manifest at a greater distance, because the hindrance of the weight is in part removed.

A.

But why does the Load-stone if it float on a Calm Water, never fail to place it self at last in the Meridian just North and South.

B.

Not so, just in the Meridian, but almost in all places with some variations. But the cause I think is, that the Axis of this Magnetical Motion is parallel to the Axis of the Ecliptique, which is the Axis of the like Motion in the Earth, and consequently that it cannot freely exercise its Natural Motion in any other Scituation.

A.

Whence may this consent of Motion in the Load-stone and the Earth proceed? Do you think (as some have written) that the Earth is a great

Load-stone?

B.

Dr. Gilbert that was the first that wrote any thing of this Subject rationally, inclines to that opinion. Decartes thought the Earth (excepting this upper crust of a few Miles depth) to be of the same Nature with all other Stars, and bright. For my part I am content to be ignorant; but I believe the Load stone hath given its virtue by a long habitude in the Mine, the Vein of it lying in the plain of some of the Meridians, or rather of some of the great Circles that pass through the Poles of the Ecliptique, which are the same with the Poles of the like Motion supposed in the Earth.

A.

If that be true I need not ask why the filings of Iron laid on a Load-stone equally distant from its Poles will lie parallel to the Axis, but one each side incline to the Pole that is next it. Nor why by drawing a Load-stone all a long a Needle of Iron, the Needle will receive the same Poles Nor why when the Load-stone and Iron (or two Load-stones) are put together floating upon Water, will fall one of them a Stern of the other, that their like parts may look the same way, and their unlike touch, in which Action they are commonly said to Repel one another. For all this may be deriv'd from the union of their Motions. One thing more I desire to know, and that is; What are those things they call Spirits? I mean Ghosts, Fairies, Hobgoblins, and the like Apparitions.

B.

They are no part of the Subject of Natural Philosophy.

A.

That which in all Ages, and all places is commonly seen (as those have been, unless a great part of Mankind by Lyers) cannot, I think, be supernatural.

B.

All this that I have hitherto said, though upon better ground than can be had for a discourse of Ghosts, you ought to take but for a Dream.

A.

I do so. But there be some Dreams more like sense then others. And that which is like sense pleases me as well (in natural Philosophy) as if it were the very truth.

B.

I was Dreaming also once of these things; but was weakened by their noise. And they never came into any Dream of mine since, unless Apparitionrs in Dreams and Ghoasts be all one.

CHAP. VIII. THE DELPHIQUE PROBLEM OR DUPLICATION OF THE CUBE.

A.

HAVE you seen a Printed Paper sent from Paris, containing the Duplication of the Cube, written in French?

B.

Yes. It was I that Writ it, and sent it thither to be Printed, on purpose to see what objections would be made to it by our Professors of Algebra here.

A.

Then you have also seen the confutations of it by Algebra.

B.

I have seen some of them; and have one by me. For there was but one that was rightly Calculated, and that is it which I have kept.

A.

Your Demonstration then is confuted though but by one.

B.

That does not follow. For though an Arithmetical Calculation be true in Numbers, yet the same may be, or rather must be false, if the Units be not

constantly the same.

A.

Is their Calculation so inconstant, or rather so foolish as you make it?

B.

Yes. For the same number is sometimes so many Lines, sometimes so many Plains, and sometimes so many Solids; as you shall plainly see, if you will take the pains to examine first a Demonstration I have to prove the said Duplication, and after that, the Algebrique Calculation which is pretended to confute it. And not only that this one is false, but also any other Arithmetical account used in Geometry, unless the numbers be always so many Lines, or always so many superficieses, or always many solids.

A.

Let me see the Geometrical Demonstration.

B.

There it is: Read it.

To find a Cube double to a Cube given.

LET the side of the Cube given be VD . Produce VD to A , till AD be double to DV . Then make the square of AD , namely $ABCD$. Divide AB and CD in the middle at E and F . Draw EF . Draw also AC cutting EF in I . Then in the sides BC and AD take BR and AS each of them equal to AI or IC .

Lastly, divide SD in the middle at T , and upon the Center T , with the distance TV , describe a semi-circle cutting AD in Y , and DC in X .

I say the Cube of $D X$ is double to the Cube of $D V$. For the three lines $D Y$, $D X$, $D V$ are in continual proportion. And Continuing the semi-circle $V X Y$ till it cut the line $R S$ drawn and produced in Z , the line $S Z$, will be equal to $D X$. And drawing $X Z$ it will pass through T . And the four lines $T V$, $T X$, $T Y$ and $T Z$ will be equal. And therefore joyning $Y X$ and $Y Z$, the Figure $V X Y Z$ will be a Rectangle.

Produce $C D$ to P so as $D P$ be equal to $A D$. Now if $Y Z$ produced fall on P , there will be three Rectangle equiangled Triangles, $D P Y$, $D Y X$, and $D X V$; and consequently four continual proportionals, $D P$, $D Y$, $D X$ and $D V$, whereof $D X$ is the least of the means. And therefore the Cube of $D X$ will be double to the Cube of $D V$.

A.

That's true; and the Cube of $D Y$ will be double to the Cube of $D X$; and the Cube of $D P$ double to the Cube of $D Y$. But that $Y Z$ produced, falls upon P , is the thing they deny, and which you ought to demonstrate.

B.

If $Y Z$ produced fall not on P , then draw $P Y$, and from V let fall a perpendicular upon $P Y$, suppose at u . Divide $P V$ in the midst at a , and joyn $a u$; which done $a u$ will be equal to $a V$ or $a P$. For because $V u P$ is a right Angle, the point u will be in the semi-circle whereof $P V$ is the Diameter.

Therefore drawing $V R$, the Angle $u V R$ will be a right Angle.

A.

Why so?

B.

Because $T V$ and $T Y$ are equal; and $T D$, $T S$ equal; $S V$ will also be equal to $D V$. And because $D P$ and $R S$ are equal and parallel, $R Y$ will be equal and parallel to $P V$. And therefore $V R$ and $P Y$ that joyn them will be equal and parallel. And the Angles $P u V$, $R V u$ will be alternate, and consequently equal. But $P u V$ is a right Angle; therefore also $R V u$ will be a right Angle.

A.

Hitherto all is evident. Proceed.

B.

From the point Y raise a perpendicular cutting $V R$ wheresoever in t , and then (because $P Y$ and $V R$ are parallel) the Angle $Y t V$ will be a right Angle. And the figure $u Y t V$ a Rectangle, and $u t$ equal to $Y V$. But $Y V$ is equal to $Z X$; and therefore $Z X$ is equal to $u t$. And $u t$ must pass through the point T (For the Diameters of any Rectangle, divide each other in the middle) therefore Z and u are the same point, and X and t the same point. Therefore $Y Z$ produced falls upon P . and $D X$ is the lesser of the two means between $A D$ and $D V$. And the Cube of $D X$ double to the Cube of $D V$ which was to be demonstrated.

A

I cannot imagine what fault there can be in this Demonstration, and yet there is one thing which seems a little strange to me. And 'tis this. You take $B R$, which is half the Diagonal, and which is the sine of 45 degrees, and which is also the mean proportional between the two Extrems. And yet you bring none of these proprieties into your Demonstration. So that though you argue from the Construction, yet you do not argue from the Cause. And

this perhaps your adversaries will object (at least) against the Art of you Demonstratideon, or enquire by what luck you pitched upon half the Diagonal for your Foundation.

B.

I see you let nothing pass. But for answer you must know, That if a man argue from the negative of the truth, though he know not that it is the truth which is denied, yet he will fall at last, after many consequences, into one absurdity or another. For though false do often produce Truth, yet it produces also absurdity, as it hath done here. But Truth produceth nothing but Truth. Therefore in Demonstrations that tend to absurdity, it is no good Logick to require all along the operation of the cause.

A.

Have you drawn from hence no Corollaries?

B.

No. I leave that for others that will; unless you take this for a Corollary, That, what Arithmetical Calculation soever contradicts it, is false.

A.

Let me see now the Algebraical Demonstration against it.

B.

Here it is.

Let A B or A D be equal to 2

Then D F or D V is equal to 1

And B R or A S is equal to the square root of 2

And A V equal to 3 want the square root of 2.

The Cube of A B is equal to 8

The Cube of D Y is equal to 45 want the Square Root of 1682 that is almost equal to 4

For 45 want the Square Root of 6681 is equal to 4

Therefore D Y is a little less then the greater of the two Means between AD and DV.

A.

There is I see some little difference between this Arithmetical aud your Geometrical Demonstration. And though it be insensible, yet if his Calculation be true, yours must needs be false, which I am sure cannot be.

B.

His Calculation is so true, that there is never a Proposition in it false, till he come to the conclusion, that the Cube of D Y. is equal to 45, want the square Root of 1682. But that, and the rest, is false.

A.

I shall easily see that A D. is certainly 2, whereof D V. is 1, and A V. is certainly 3, whereof D V. is 1.

B.

Right.

A.

And B R. is without doubt the square Root of 2.

B.

Why, what is 2?

A.

2, is the Line A D. as being double to D V. which is 1.

B.

And so, the Line B R. is the square Root of the Line A D.

A.

Out upon it it, it's absurd. Why do you grant it to be true in Arithmetick?

B.

In Arithmetick the numbers consist of so many Units; and are never considered there as nothings. And therefore every one Line has some Latitude, and if you allow to BI. the Semi-diagonal the same Latitude you do to AB. or to BR. you will quickly see the Square of half the Diagonal to be equal to twice the Square of half AB.

A.

Well, but then your Demonstration is not confuted; for the Point Y, will have Latitude enough to take in that little difference which is between the Root of 1681 and the Root of 1682. This putting off an Vuit sometimes for one Line, sometimes for one Square, must needs marr the reckoning. Again he says the Cube of AB. is equal to 8. but seeing AB. is 2, the Cube of AB.

must be just equal to four of its own sides; so that the Vnit which was before sometimes a Line, sometimes a Square, is now a Cube.

B.

It can be no otherwise when you so apply Arithmetick to Geometry, as to number the Lines of a Plain, or the Plains of a Cube.

A.

In the next place, I find that the Cube of DY. is equal to 45, want the Square Root of 1622. What is that 45? Lines, or Squares, or Cubes?

B.

Cubes, Cubes of DV.

A.

Then if you add to 45 Cubes of DV. the Square Root of 1682, the sum will be 45 Cubes of DV. And if you add to the Cube of DY. the same Root of 1682, the sum will be the Cube of DY. plus the Square Root of 1682. And these two sums must be equal.

B.

They must so.

A.

But the Square Root of 1682, being a Line, adds nothing to a Cube; therefore the Cube alone of DY. which he says is equal almost to 4. Cubes of DV. is equal to 45 Cubes of the same DV.

B.

All these impossibilities do necessarily follow the confounding of Arithmetick and Geometry.

A.

I pray you let me see the Operation by which the Cube of DY. (that is the Cube of 3, want the Root of 2,) is found equal to 45, want the Square Root of 1682.

A detection of the absurd use of Arithmetick as it is now applied to Geometry.

B.

Here it is.

3 — r. 2.

3 — r. 2.

— r. 18 +2:

9 — r. 18

9 — r. 72 +2.

3 — r. 2.

— r. 162+12 — r. 8.

27 — r. 648+6

27 — r. 658 — r. 162+18 — r. 8.

A.

Why for two Roots of 18 do you put the Root of 72.

B.

Because 2 Roots of 18 is equal to one Root of 4 times 18, which is 72.

A.

Next we have, That the Root of 2 Multiplied into 2, makes the Root of 8. How is that true?

B.

Does it not make 2 Roots of 2? And is not BR. the Root of 2, and 2 BR equal to the Diagonal? And is not the diagonal the root of a square equal to 8 squares of DV?

A.

'Tis true. But here the root of 8 is put for the Cube of the root of 2. Can a line be equal to a Cube?

B.

No. But here we are in Arithmetick again, and 8 is a Cubique number.

A.

How does the root of 2 multiplied into the root of 72 make 12?

B.

Because it makes the root of 2 times 72, that is to say the root of 144 which is 12.

A.

How does 9 roots of 2 make the root of 162?

B.

Because it makes the root of 2 squares of 9, that is the root of 162.

A.

How does 3 roots of 72 make the root of 648?

B.

Because it makes the root of 9 times 72, that is of 648.

A.

For the total Sum I see 27 and 18 which make 45. Therefore the root of 648 together with the root of 162• and of 8, which are to be deducted from 45, ought to be equal to the root of 1682.

B.

So they are. For 648 multiplied by 162 makes 104976 of which the double root is — 648 and 648 and 162 added together make — 810.

Therefore the root of 948, added to the root of 162 makes the root of — 1459

Again 1458 into 8 is 11664. The double root whereof is — 216.

The Sum of 1458 and 8 added together is — 1466.

The Sum of 1466 and 216 is 1682, and the root, the root of — 1682.

A.

I see the Calculation in numbers is right, though false in lines. The reason whereof can be no other then some difference between multiplying

numbers into lines or plains, and multiplying lines into the same lines or plains.

B.

The difference is manifest. For when you multiply a number into lines, the product is lines; as the number 2 multiplyed into 3 lines is no more then 3 lines 2 times told. But if you multiply lines into lines you make plains, and if you multiply lines into plains you make solid bodies. In Geometry there are but three dimensions, Length, Superficies, and Body. In Arithmetick there is but one, and that is Number or Length which you will. And though there be some Numbers called Plain, others Solid, others Plano-solid, others Square, others Cubique, others Square-square, others Quadrato-cubique, others Cubi-cubique &c. yet are all these but one dimension, namely Number, or a file of things Numbered.

A.

But seeing this way of Calculation by Numbers is so apparently false, what is the reason this Calculation came so near the truth.

B.

It is because in Arithmetick Units are not Nothings, and therefore have breadth. And therefore many Lines set together make a superficies though their breadth be insensible. And the greater the number is into which you divide your Line, the less sensible will be your error.

A.

Archimedes, to find a streight Line equal to the circumference of a Circle, used this way of extracting Roots. And 'tis the way also by which

the Table of Sines, Secants and Tangents have been calculated, Are they all Cut?

B.

As for Archimedes, there is no man that does more admire him then I do. But there is no man that cannot Err. His reasoning is good. But he ads all other Geometricians before and after him, have had two Principles that cross one another when they are applyed to one and the same Science. One is, that a Point is no part of a Line which is true in Geometry, where a part of a Line when it is called a Point, is not reckoned; another is, that a Unit is part of a Number which is also true; but when they reckon by Arithmetick in Geometry, there a Unit is sometimes part of a Line, sometimes a part of a Square, and sometimes part of a Cube.

As for the Table of Sines, Secants and Tangents, I am not the first that find fault with them. Yet I deny not but they are true enough for the reckoning of Acres in a Map of Land.

A.

What a deal of Labour has been lost by them that being Professors of Geometry have read nothing else to their Auditors but such stuff as this you have here seen. And some of them have written great Books of it in strange characters, such as in troublesome times, a man would suspect to be a Cypher.

B.

I think you have seen enough to satisfie you, that what I have written heretofore concerning the Quadrature of the Circle, and of other Figures made in imitation of the Parabola, has not been yet confuted.

A.

I see you have wrested out of the hands of our Antagonists this weapon of Algebra, so as they can never make use of it again. Which I consider as a thing of much more consequence to the science of Geometry, then either of the Duplication of the Cube, or the finding of two mean Proportionals, or the Quadrature of a Circle, or all these Problems put together.

FINIS.

A Dialogue between a Philosopher and a Student of the Common Laws of England

MOLESWORTH 1840 EDITION

This late treatise reveals an unexplored dimension of Hobbes' famous doctrine of sovereignty. First published posthumously in 1681, the *Dialogue* sets forth his mature reflections of the relation between reason and law, offering ideas that are more liberal than those found in *Leviathan* and his other well-known writings. Hobbes proposes a separation of the functions of government in the interest of common sense and humaneness, without visibly violating his belief that the sharing or division of sovereignty is an absurdity.

A DIALOGUE BETWEEN A PHILOSOPHER & A STUDENT OF THE COMMON LAWS OF ENGLAND.

LAWYER.

What makes you say, that the study of the law is less rational than the study of the mathematics?

Of the law of reason.

Philosopher.

I say not that; for all study is rational, or nothing worth: but I say, that the great masters of the mathematics do not so often err as the great professors of the law.

L.

If you had applied your reason to the law, perhaps you would have been of another mind.

P.

In whatsoever study, I examine whether my inference be rational: and have looked over the titles of the statutes from Magna Charta downward to this present time. I left not one unread, which I thought might concern myself; which was enough for me, that meant not to plead for any but myself. But I did not much examine which of them was more or less rational; because I read them not to dispute, but to obey them, and saw in all of them sufficient reason for my obedience, and that the same reason, though the Statutes themselves were changed, remained constant. I have also diligently read over Littleton's book of Tenures, with the commentaries thereupon of the renowned lawyer Sir Edward Coke; in which I confess I

found great subtilty, not of the law, but of inference from law, and especially from the law of human nature, which is the law of reason: and I confess that it is truth which he says in the epilogue to his book, that by arguments and reason in the law, a man shall sooner come to the certainty and knowledge of the law: and I agree with Sir Edward Coke, who upon that text farther says, that reason is the soul of the law; and upon section 138, *nihil, quod est contra rationem, est licitum*; that is to say, nothing is law that is against reason; and that reason is the life of the law, nay the common law itself is nothing else but reason; and upon section 21, *æquitas est perfecta quædam ratio, quæ jus scriptum interpretatur et emendat, nulla scriptura comprehensa, sed solum in vera ratione consistens*; i. e. Equity is a certain perfect reason, that interpreteth and amendeth the law written, itself being unwritten, and consisting in nothing else but right reason. When I consider this, and find it to be true, and so evident as not to be denied by any man of right sense, I find my own reason at a stand; for it frustrates all the laws in the world. For upon this ground any man, of any law whatsoever, may say it is against reason, and thereupon make a pretence for his disobedience. I pray you clear this passage, that we may proceed.

L.

I clear it thus, out of Sir Edward Coke (i. Inst. sect. 138), that this is to be understood of an artificial perfection of reason, gotten by long study, observation, and experience, and not of every man's natural reason; for *nemo nascitur artifex*. This legal reason is *summa ratio*; and therefore if all the reason that is dispersed into so many several heads, were united into one, yet could he not make such a law as the law of England is; because by so many successions of ages it hath been fined and refined by an infinite number of grave and learned men.

P.

This does not clear the place, as being partly obscure, and partly untrue. That the reason which is the life of the law, should be not natural, but artificial, I cannot conceive. I understand well enough, that the knowledge of the law is gotten by much study, as all other sciences are, which when they are studied and obtained, it is still done by natural, and not by artificial reason. I grant you, that the knowledge of the law is an art; but not that any art of one man, or of many, how wise soever they be, or the work of one or more artificers, how perfect soever it be, is law. It is not wisdom, but authority that makes a law. Obscure also are the words legal reason. There is no reason in earthly creatures, but human reason. But I suppose that he means, that the reason of a judge, or of all the judges together without the King, is that summa ratio, and the very law: which I deny, because none can make a law but he that hath the legislative power. That the law hath been fined by grave and learned men, meaning the professors of the law, is manifestly untrue; for all the laws of England have been made by the kings of England, consulting with the nobility and commons in parliament, of which not one of twenty was a learned lawyer.

L.

You speak of the statute law, and I speak of the common law.

P.

I speak generally of law.

L.

Thus far I agree with you, that statute law taken away, there would not be left, either here, or any where, any law at all that would conduce to the peace of a nation; yet equity and reason, (laws Divine and eternal, which oblige all men at all times, and in all places), would still remain, but be obeyed by few: and though the breach of them be not punished in this

world, yet they will be punished sufficiently in the world to come. Sir Edward Coke, for drawing to the men of his own profession as much authority as lawfully he might, is not to be reprehended; but to the gravity and learning of the judges they ought to have added in the making of laws, the authority of the King, which hath the sovereignty: for of these laws of reason, every subject that is in his wits, is bound to take notice at his peril, because reason is part of his nature, which he continually carries about with him, and may read it, if he will.

P.

It is very true; and upon this ground, if I pretend within a month or two to make myself able to perform the office of a judge, you are not to think it arrogance; for you are to allow to me, as well as to other men, my pretence to reason, which is the common law, (remember this, that I may not need again to put you in mind, that reason is the common law): and for statute law, seeing it is printed, and that there be indexes to point me to every matter contained in them, I think a man may profit in them very much in two months.

L.

But you will be but an ill pleader.

P.

A pleader commonly thinks he ought to say all he can for the benefit of his client, and therefore has need of a faculty to wrest the sense of words from their true meaning, and the faculty of rhetoric to seduce the jury, and sometimes the judge also, and many other arts which I neither have, nor intend to study.

L.

But let the judge, how good soever he thinks his reasoning, take heed that he depart not too much from the letter of the statute: for it is not without danger.

P.

He may without danger recede from the letter, if he do not from the meaning and sense of the law; which may be by a learned man, (such as judges commonly are,) easily found out by the preamble, the time when it was made, and the inconveniences for which it was made. But I pray tell me, to what end were statute laws ordained, seeing the law of reason ought to be applied to every controversy that can arise.

L.

You are not ignorant of the force of an irregular appetite to riches, to power, and to sensual pleasures, how it masters the strongest reason, and is the root of disobedience, slaughter, fraud, hypocrisy, and all manner of evil habits; and that the laws of man, though they can punish the fruits of them, which are evil actions, yet they cannot pluck up the roots that are in the heart. How can a man be indicted of avarice, envy, hypocrisy, or other vicious habit, till it be declared by some action which a witness may take notice of? The root remaining, new fruit will come forth, till you be weary of punishing, and at last destroy all power that shall oppose it.

P.

What hope then is there of a constant peace in any nation, or between one nation and another?

L.

You are not to expect such a peace between two nations; because there is no common power in this world to punish their injustice. Mutual fear may keep them quiet for a time; but upon every visible advantage they will

invade one another; and the most visible advantage is then, when the one nation is obedient to their king, and the other not. But peace at home may then be expected durable, when the common people shall be made to see the benefit they shall receive by their obedience and adhesion to their own sovereign, and the harm they must suffer by taking part with them, who by promises of reformation, or change of government, deceive them. And this is properly to be done by divines, and from arguments not only from reason, but also from the Holy Scripture.

P.

This that you say is true, but not very much to that I aim at by your conversation, which is to inform myself concerning the laws of England. Therefore I ask you again, what is the end of statute-laws?

L.

I say then that the scope of all human law is peace, and justice in every nation amongst themselves, and defence against foreign enemies.

Of sovereign power.

P.

But what is justice?

L.

Justice is giving to every man his own.

P.

The definition is good, and yet it is Aristotle's. What is the definition agreed upon as a principle in the science of the common law?

L.

The same with that of Aristotle.

P.

See, you lawyers, how much you are beholden to the philosopher; and it is but reason; for the more general and noble science and law of all the world, is true philosophy, of which the common law of England is a very little part.

L.

It is so, if you mean by philosophy nothing but the study of reason; as I think you do.

P.

When you say that justice gives to every man his own, what mean you by his own? How can that be given me, which is my own already? Or, if it be not my own, how can justice make it mine?

L.

Without law, every thing is in such sort every man's, as he may take, possess, and enjoy, without wrong to any man; every thing, lands, beasts, fruits, and even the bodies of other men, if his reason tell him he cannot otherwise live securely. For the dictates of reason are little worth, if they tended not to the preservation and improvement of men's lives. Seeing then without human law all things would be common, and this community a cause of encroachment, envy, slaughter, and continual war of one upon another, the same law of reason dictates to mankind, for their own preservation, a distribution of lands and goods, that each man may know what is proper to him, so as none other might pretend a right thereunto, or disturb him in the use of the same. This distribution is justice, and this properly is the same which we say is one's own; by which you may see the great necessity there was of statute laws, for preservation of all mankind. It is also a dictate of the law of reason, that statute laws are a necessary means

of the safety and well-being of man in the present world, and are to be obeyed by all subjects, as the law of reason ought to be obeyed, both by King and subjects, because it is the law of God.

P.

All this is very rational; but how can any laws secure one man from another, when the greatest part of men are so unreasonable, and so partial to themselves as they are, and the laws of themselves are but a dead letter, which of itself is not able to compel a man to do otherwise than himself pleaseth, nor punish or hurt him when he hath done a mischief?

L.

By the laws, I mean laws living and armed. For you must suppose, that a nation that is subdued by war to an absolute submission to a conqueror, may, by the same arm that compelled it to submission, be compelled to obey his laws. Also, if a nation choose a man, or an assembly of men, to govern them by laws, it must furnish him also with armed men and money, and all things necessary to his office; or else his laws will be of no force, and the nation remains, as before it was, in confusion. It is not therefore the word of the law, but the power of a man that has the strength of a nation, that make the laws effectual. It was not Solon that made Athenian laws, though he devised them, but the supreme court of the people; nor, the lawyers of Rome that made the imperial law in Justinian's time, but Justinian himself.

P.

We agree then in this, that in England it is the King that makes the laws, whosoever pens them; and in this, that the King cannot make his laws effectual, nor defend his people against their enemies, without a power to levy soldiers; and consequently, that he may lawfully, as oft as he shall

really think it necessary to raise an army, (which in some occasions be very great) I say, raise it, and money to maintain it. I doubt not but you will allow this to be according to the law, at least of reason.

L.

For my part I allow it. But you have heard how, in and before the late troubles the people were of another mind. Shall the King, said they, take from us what he pleases, upon pretence of a necessity whereof he makes himself the judge? What worse condition can we be in from an enemy? What can they take from us more than what they list?

P.

The people reason ill. They do not know in what condition we were, in the time of the Conqueror, when it was a shame to be an Englishman; who, if he grumbled at the base offices he was put to by his Norman masters, received no other answer than this, thou art but an Englishman. Nor can the people, nor any man that humours their disobedience, produce any example of a King that ever raised any excessive sums, either by himself or by the consent of his Parliament, but when they had great need thereof; nor can show any reason that might move any of them so to do. The greatest complaint by them made against the unthriftiness of their Kings, was for the enriching now and then a favourite, which to the wealth of the kingdom was inconsiderable, and the complaint but envy. But in this point of raising soldiers, what is, I pray you, the statute law?

L.

The last statute concerning it, is 13 Car. II. ca, by which the supreme government, command, and disposing of the militia of England, is delivered to be, and always to have been, the ancient right of the Kings of England. But there is also in the same act a proviso, that this shall not be construed

for a declaration, that the King may transport his subjects, or compel them to march out of the kingdom; nor is it, on the contrary, declared to be unlawful.

P.

Why is not that also determined?

L.

I can imagine cause enough for it, though I may be deceived. We love to have our King amongst us, and not to be governed by deputies, either of our own or another nation. But this I verily believe, that if a foreign enemy should either invade us, or put himself into a readiness to invade either England, Ireland, or Scotland, no Parliament then sitting, and the King send English soldiers thither, the Parliament would give him thanks for it. The subjects of those Kings who affect the glory, and imitate the actions, of Alexander the Great, have not always the most comfortable lives, nor do such Kings usually very long enjoy their conquests. They march to and fro perpetually, as upon a plank sustained only in the midst; and when one end rises, down goes the other.

P.

It is well. But where soldiers, in the judgment of the King's conscience, are indeed necessary, as in an insurrection, or rebellion at home; how shall the kingdom be preserved without a considerable army ready and in pay? How shall money be raised for this army, especially when the want of public treasure inviteth neighbour Kings to encroach, and unruly subjects to rebel?

L.

I cannot tell. It is matter of polity, not of law. But I know, that there be statutes express, whereby the King hath obliged himself never to levy

money upon his subjects without the consent of his Parliament. One of which statutes is 25 Edw. I. c. 6, in these words: We have granted for us, and our heirs, as well to archbishops, bishops, abbots, priors, and other folk of holy Church, as also to earls, barons, and to all the commonalty of the land, that for no business from henceforth, we shall take such aids, tasks, or prizes, but by the common consent of the realm. There is also another statute of Edward I. (34 Edw. I. stat. 4) in these words: No tallage, or aid shall be taken or levied by us or our heirs in our realm, without the good will and assent of the archbishops, bishops, earls, barons, knights, burgesses, and other freemen of the land; which statutes have been since that time confirmed by divers other Kings, and lastly by the King that now reigneth.

P.

All this I know, and am not satisfied. I am one of the common people, and one of that almost infinite number of men, for whose welfare Kings and other sovereigns were by God ordained: for God made Kings for the people, and not people for Kings. How shall I be defended from the domineering of proud and insolent strangers that speak another language, that scorn us, that seek to make us slaves, or how shall I avoid the destruction that may arise from the cruelty of factions in a civil war, unless the King, to whom alone, you say, belongeth the right of levying and disposing of the militia by which only it can be prevented, have ready money, upon all occasions, to arm and pay as many soldiers, as for the present defence, or the peace of the people, shall be necessary? Shall not I, and you, and every man be undone? Tell me not of a Parliament, when there is no Parliament sitting, or perhaps none in being, which may often happen. And when there is a Parliament, if the speaking and leading men should have a design to put down monarchy, as they had in the Parliament which began to sit the third of November, 1640, shall the King, who is to answer to God Almighty for the safety of the

people, and to that end is intrusted with the power to levy and dispose of the soldiery, be disabled to perform his office, by virtue of these acts of Parliament which you have cited? If this be reason, it is reason also that the people be abandoned, or left at liberty to kill one another, even to the last man; if it be not reason, then you have granted it is not law.

L.

It is true, if you mean *recta ratio*; but *recta ratio*, which I grant to be law, as Sir Edward Coke says, (1 Inst. sect. 138), is an artificial perfection of reason, gotten by long study, observation, and experience, and not every man's natural reason; for *nemo nascitur artifex*. This legal reason is *summa ratio*; and therefore, if all the reason that is dispersed into so many several heads, were united into one, yet could he not make such a law as the law of England is, because by many successions of ages it hath been fined and refined by an infinite number of grave and learned men. And this is it, he calls the common law.

P.

Do you think this to be good doctrine? Though it be true, that no man is born with the use of reason, yet all men may grow up to it as well as lawyers; and when they have applied their reason to the laws, (which were laws before they studied them, or else it was not law they studied), may be as fit for and capable of judicature, as Sir Edward Coke himself, who whether he had more or less use of reason, was not thereby a judge, but because the King made him so. And whereas he says, that a man who should have as much reason as is dispersed in so many several heads, could not make such a law as this law of England is; if one should ask him who made the law of England, would he say a succession of English lawyers or judges made it, or rather a succession of kings? And that upon their own reason, either solely, or with the advice of the Lords and Commons in

Parliament, without the judges or other professors of the law? You see therefore that the King's reason, be it more or less, is that *anima legis*, that *summa lex*, whereof Sir Edward Coke speaketh, and not the reason, learning, or wisdom of the judges. But you may see, that quite through his Institutes of Law, he often takes occasion to magnify the learning of the lawyers, whom he perpetually termeth the sages of the Parliament, or of the King's council. Therefore unless you say otherwise, I say, that the King's reason, when it is publicly upon advice and deliberation declared, is that *anima legis*; and that *summa ratio* and that equity, which all agree to be the law of reason, is all that is or ever was law in England, since it became Christian, besides the Bible.

L.

Are not the Canons of the Church part of the law of England, as also the imperial law used in the Admiralty, and the customs of particular places, and the by-laws of corporations and courts of judicature?

P.

Why not? For they were all constituted by the Kings of England; and though the civil law used in the Admiralty were at first the statutes of the Roman empire, yet because they are in force by no other authority than that of the King, they are now the King's laws, and the King's statutes. The same we may say of the Canons; such of them as we have retained, made by the Church of Rome, have been no law, nor of any force in England, since the beginning of Queen Elizabeth's reign, but by virtue of the great seal of England.

L.

In the said statutes that restrain the levying of money without consent of Parliament, is there any thing you can take exceptions to?

P.

No. I am satisfied that the kings that grant such liberties, are bound to make them good, so far as it may be done without sin: but if a King find that by such a grant he be disabled to protect his subjects, if he maintain his grant, he sins; and therefore may, and ought to take no notice of the said grant. For such grants, as by error or false suggestion are gotten from him, are, as the lawyers do confess, void and of no effect, and ought to be recalled. Also the King, as is on all hands confessed, hath the charge lying upon him to protect his people against foreign enemies, and to keep the peace betwixt them within the kingdom: if he do not his utmost endeavour to discharge himself thereof, he committeth a sin, which neither King nor Parliament can lawfully commit.

L.

No man, I think, will deny this. For if levying of money be necessary, it is a sin in the Parliament to refuse; if unnecessary, it is a sin both in King and Parliament to levy. But for all that, it may be, and I think it is, a sin in any one that hath the sovereign power, be he one man or one assembly, being intrusted with the safety of a whole nation, if rashly, and relying upon his own natural sufficiency, he make war or peace, without consulting with such, as by their experience and employment abroad, and intelligence by letters, or other means, have gotten the knowledge in some measure of the strength, advantages, and designs of the enemy, and the manner and the degree of the danger that may from thence arise. In like manner, in case of rebellion at home, if he consult not with those of military condition; which if he do, then I think he may lawfully proceed to subdue all such enemies and rebels; and that the soldiers ought to go on without inquiring whether they be within the country, or without. For who shall suppress rebellion, but he that hath right to levy, command, and dispose of the militia? The last

Long Parliament denied this. But why? Because by the major part of their votes the rebellion was raised with the design to put down monarchy, and to that end maintained.

P.

Nor do I hereby lay any aspersion upon such grants of the King and his ancestors. Those statutes are in themselves very good for the King and the people, as creating some kind of difficulty for such Kings as, for the glory of conquest, might spend one part of their subjects' lives and estates in molesting other nations, and leave the rest to destroy themselves at home by factions. That which I here find fault with, is the wresting of those, and other such statutes, to the binding of our Kings from the use of their armies in the necessary defence of themselves and their people. The late Long Parliament, that in 1648 murdered their King, (a King that sought no greater glory upon earth, but to be indulgent to his people, and a pious defender of the Church of England,) no sooner took upon them the sovereign power, than they levied money upon the people at their own discretion. Did any of their subjects dispute their power? Did they not send soldiers over the sea to subdue Ireland, and others to fight against the Dutch at sea; or made they any doubt but to be obeyed in all that they commanded, as a right absolutely due to the sovereign power in whomsoever it resides? I say not this as allowing their actions, but as a testimony from the mouths of those very men that denied the same power to him whom they acknowledged to have been their sovereign immediately before; which is a sufficient proof, that the people of England never doubted of the King's right to levy money for the maintenance of his armies, till they were abused in it by seditious teachers, and other prating men, on purpose to turn the State and Church into popular government, where the most ignorant and boldest talkers do commonly obtain the best preferments. Again, when their new republic returned into monarchy by Oliver, who durst deny him money upon any

pretence of Magna Charta, or of these other acts of Parliament which you have cited? You may therefore think it good law, for all your books, that the King of England may at all times, that he thinks in his conscience it will be necessary for the defence of his people, levy as many soldiers and as much money as he please, and that himself is judge of the necessity.

L.

Is there nobody hearkening at the door?

P.

What are you afraid of?

L.

I mean to say the same that you say: but there be very many yet, that hold their former principles, whom neither the calamities of the civil wars, nor their former pardon, have thoroughly cured of their madness.

P.

The common people never take notice of what they hear of this nature, but when they are set on by such as they think wise; that is, by some sorts of preachers, or some that seem to be learned in the laws, and withal speak evil of the governors. But what if the King, upon the sight or apprehension of any great danger to his people, (as when their neighbours are borne down by the current of a conquering enemy), should think his own people might be involved in the same misery; may he not levy, pay, and transport soldiers to help those weak neighbours, by way of prevention to save his own people and himself from servitude? Is that a sin?

L.

First, if the war upon our neighbour be just, it may be questioned whether it be equity or no to assist them against the right.

P.

For my part, I make no question of that at all, unless the invader will, and can, put me in security, that neither he nor his successors shall make any advantage of the conquest of my neighbour, to do the same to me in time to come. But there is no common power to bind them to the peace.

L.

Secondly, when such a thing shall happen, the Parliament will not refuse to contribute freely to the safety of themselves and the whole nation.

P.

It may be so, and it may be not; for if a Parliament then sit not, it must be called; that requires six weeks' time; debating and collecting what is given requires as much, and in this time the opportunity perhaps is lost. Besides, how many wretched souls have we heard to say in the late troubles; what matter is it who gets the victory? We can pay but what they please to demand, and so much we pay now. And this they will murmur, as they have ever done, whosoever shall reign over them, as long as their covetousness and ignorance hold together; which will be till doomsday, if better order be not taken for their instruction in their duty, both from reason and religion.

L.

For all this I find it somewhat hard, that a King should have right to take from his subjects, upon the pretence of necessity, what he pleaseth.

P.

I know what it is that troubles your conscience in this point. All men are troubled at the crossing of their wishes; but it is our own fault. First, we wish impossibilities; we would have our security against all the world upon right of property, without paying for it; this is impossible. We may as well

expect that fish and fowl should boil, roast, and dish themselves, and come to the table, and that grapes should squeeze themselves into our mouths, and have all other the contentments and ease which some pleasant men have related of the land of Cocagne. Secondly, there is no nation in the world where he or they that have the sovereignty, do not take what money they please for the defence of those respective nations, when they think it necessary for their safety. The late Long Parliament denied this; but why? Because there was a design amongst them to depose the King. Thirdly, there is no example of any King of England that I have read of, that ever pretended any such necessity for levying money against his conscience. The greatest sums that ever were levied, comparing the value of money, as it was at that time, with what it is now, were levied by King Edward III and King Henry V; kings in whom we glory now, and think their actions great ornaments to the English history. Lastly, as to the enriching now and then a favourite, it is neither sensible to the kingdom, nor is any treasure thereby conveyed out of the realm, but so spent as it falls down again upon the common people. To think that our condition being human should be subject to no incommodity, were injuriously to quarrel with God Almighty for our own faults.

L.

I know not what to say.

P.

If you allow this that I have said, then say, that the people never were, shall be, or ought to be, free from being taxed at the will of one or other; that if civil war come, they must levy all they have, and that dearly, from the one or from the other, or from both sides. Say, that adhering to the King, their victory is an end of their trouble; that adhering to his enemies there is no end; for the war will continue by a perpetual subdivision, and when it

ends, they will be in the same estate they were before. That they are often abused by men who to them seem wise, when then their wisdom is nothing else but envy of those that are in grace and in profitable employments; and that those men do but abuse the common people to their own ends, that set up a private man's propriety against the public safety. But say withal, that the King is subject to the laws of God, both written and unwritten, and to no other; and so was William the Conqueror, whose right is all descended to our present King.

L.

As to the law of reason, which is equity, it is sure enough there is but one legislator, which is God.

P.

It followeth, then, that which you call the common law, distinct from statute law, is nothing else but the law of God.

L.

In some sense it is; but it is not Gospel, but natural reason, and natural equity.

P.

Would you have every man to every other man allege for law his own particular reason? There is not amongst men a universal reason agreed upon in any nation, besides the reason of him that hath the sovereign power. Yet though his reason be but the reason of one man, yet it is set up to supply the place of that universal reason, which is expounded to us by our Saviour in the Gospel; and consequently our King is to us the legislator both of statute-law, and of common-law.

L.

Yes, I know that the laws spiritual, which have been law in this kingdom since the abolishing of popery, are the King's laws, and those also that were made before. For the Canons of the Church of Rome were no laws, neither here, nor anywhere else without the Pope's temporal dominions, farther than kings and states in their several dominions respectively did make them so.

P.

I grant that. But you must grant also, that those spiritual laws were made by the legislators of the spiritual law And yet not all kings and states make laws by consent of the Lords and Commons; but our King here is so far bound to their assents, as he shall judge conducing to the good and safety of his people. For example, if the Lords and Commons should advise him to restore those laws spiritual, which in Queen Mary's time were in force, I think the King were by the law of reason obliged, without the help of any other law of God, to neglect such advice.

L.

I grant you that the King is sole legislator; but with this restriction, that if he will not consult with the Lords of Parliament, and hear the complaints and informations of the Commons, that are best acquainted with their own wants, he sinneth against God, though he cannot be compelled to any thing by his subjects by arms and force.

P.

We are agreed upon that already. Since therefore the King is sole legislator, I think it also reason he should be sole supreme judge.

L.

There is no doubt of that; for otherwise there would be no congruity of judgments with the laws. I grant also that he is the supreme judge over all

persons, and in all causes civil and ecclesiastical within his own dominions; not only by act of Parliament at this time, but that he has ever been so by the common law. For the judges of both the Benches have their offices by the King's letters-patent; and so as to judicature have the bishops. Also the Lord Chancellor hath his office by receiving from the King the Great Seal of England. And, to say all at once, there is no magistrate, or commissioner for public business, neither of judicature nor execution, in State or Church, in peace or war, but he is made so by authority from the King.

The King is the supreme judge.

P.

It is true; but perhaps you may think otherwise, when you read such acts of parliament, as say, that the King shall have power and authority to do this or that by virtue of that act, as Elizabeth c. I “that your highness, your heirs, and successors, Kings, or Queens of this realm, shall have full power and authority, by virtue of this act, by letters-patent under the great seal of England, to assign, &c.” Was it not this Parliament that gave this authority to the Queen?

L.

No. For the statute in this clause is no more than, as Sir Edward Coke useth to speak, an affirmance of the common-law. For she being head of the Church of England, might make commissioners for the deciding of matters ecclesiastical, as freely as if she had been Pope, who did, you know, pretend his right from the law of God.

P.

We have hitherto spoken of laws without considering anything of the nature and essence of a law; and now unless we define the word law, we can go no farther without ambiguity and fallacy, which will be but loss of time;

whereas, on the contrary, the agreement upon our words will enlighten all we have to say hereafter.

L.

I do not remember the definition of law in any statute.

P.

I think so: for the statutes were made by authority, and not drawn from any other principles than the care of the safety of the people. Statutes are not philosophy, as is the common-law, and other disputable arts, but are commands or prohibitions, which ought to be obeyed, because assented to by submission made to the Conqueror here in England, and to whosoever had the sovereign power in other commonwealths; so that the positive laws of all places are statutes. The definition of law was therefore unnecessary for the makers of statutes, though very necessary to them whose work it is to teach the sense of the law.

L.

There is an accurate definition of a law in Bracton, cited by Sir Edward Coke: *Lex est sanctio justa, iubens honesta, et prohibens contraria*.

P.

That is to say, law is a just statute, commanding those things which are honest, and forbidding the contrary. From whence it followeth, that in all cases it must be the honesty or dishonesty that makes the command a law; whereas you know that but for the law we could not, as saith St. Paul, have known what is sin. Therefore this definition is no ground at all for any farther discourse of law. Besides, you know the rule of honest and dishonest refers to honour, and that it is justice only, and injustice, that the law respecteth. But that which I most except against in this definition, is, that it supposes that a statute made by the sovereign power of a nation may be

unjust. There may indeed in a statute-law, made by men, be found iniquity, but not injustice.

L.

This is somewhat subtle. I pray deal plainly. What is the difference between injustice and iniquity?

P.

I pray you tell me first, what is the difference between a court of justice, and a court of equity?

L.

A court of justice is that which hath cognizance of such causes as are to be ended by the positive laws of the land; and a court of equity is that, to which belong such causes as are to be determined by equity; that is to say, by the law of reason.

P.

You see then that the difference between injustice and iniquity is this; that injustice is the transgression of a statute-law, and iniquity the transgression of the law of reason. But perhaps you mean by common-law, not the law itself, but the manner of proceeding in the law, as to matter of fact, by twelve men, freeholders; though those twelve men are no court of equity, nor of justice, because they determine not what is just or unjust, but only whether it be done or not done; and their judgment is nothing else but a confirmation of that which is properly the judgment of the witnesses. For to speak exactly, there cannot possibly be any judge of fact besides the witnesses.

L.

How would you have a law defined?

P.

Thus; a law is the command of him or them that have the sovereign power, given to those that be his or their subjects, declaring publicly and plainly what every of them may do, and what they must forbear to do.

L.

Seeing all judges in all courts ought to judge according to equity, which is the law of reason, a distinct court of equity seemeth to me to be unnecessary, and but a burthen to the people, since common-law and equity are the same law.

P.

It were so indeed, if judges could not err; but since they may err, and that the King is not bound to any other law but that of equity, it belongs to him alone to give remedy to them that, by the ignorance or corruption of a judge, shall suffer damage.

L.

By your definition of a law, the King's proclamation under the Great Seal of England is a law; for it is a command, and public, and of the sovereign to his subjects.

P.

Why not, if he think it necessary for the good of his subjects? For this is a maxim at the common-law alleged by Sir Edward Coke himself, (i Inst. sect. 306), *Quando lex aliquid concedit, concedere videtur et id per quod devenitur ad illud*. And you know out of the same author, that divers Kings of England have often, to the petitions in Parliament which they granted, annexed such exceptions as these, unless there be necessity, saving our regality; which I think should be always understood, though they be not

expressed; and are understood so by common lawyers, who agree that the King may recall any grant wherein he was deceived.

L.

Again, whereas you make it of the essence of a law to be publicly and plainly declared to the people, I see no necessity for that. Are not all subjects bound to take notice of all acts of Parliament, when no act can pass without their consent?

P.

If you had said that no act could pass without their knowledge, then indeed they had been bound to take notice of them; but none can have knowledge of them but the members of the houses of Parliament; therefore the rest of the people are excused. Or else the knights of the shire should be bound to furnish people with a sufficient number of copies, at the people's charge, of the acts of Parliament, at their return into the country; that every man may resort to them, and by themselves, or friends, take notice of what they are obliged to. For otherwise it were impossible they should be obeyed: and that no man is bound to do a thing impossible, is one of Sir Edward Coke's maxims at the common-law. I know that most of the statutes are printed; but it does not appear that every man is bound to buy the book of statutes, nor to search for them at Westminster or at the Tower, nor to understand the language wherein they are for the most part written.

L.

I grant it proceeds from their own faults; but no man can be excused by ignorance of the law of reason, that is to say, by ignorance of the common-law, except children, madmen, and idiots. But you exact such a notice of the statute-law, as is almost impossible. Is it not enough that they in all places have a sufficient number of the penal statutes?

P.

Yes; if they have those penal statutes near them. But what reason can you give me why there should not be as many copies abroad of the statutes, as there be of the Bible?

L.

I think it were well that every man that can read, had a statute-book; for certainly no knowledge of those laws, by which men's lives and fortunes can be brought into danger, can be too much. I find a great fault in your definition of law; which is, that every law either forbiddeth or commandeth something. It is true that the moral law is always a command or a prohibition, or at least implieth it. But in the Levitical law, where it is said that he that stealeth a sheep shall restore fourfold, what command or prohibition lieth in these words?

P.

Such sentences as that are not in themselves general, but judgments; nevertheless, there is in those words implied a commandment to the judge, to cause to be made a fourfold restitution.

L.

That is right.

P.

Now define what justice is, and what actions and men are to be called just.

L.

Justice is the constant will of giving to every man his own; that is to say, of giving to every man that which is his right, in such manner as to exclude the right of all men else to the same thing. A just action is that which is not

against the law. A just man is he that hath a constant will to live justly; if you require more, I doubt there will no man living be comprehended within the definition.

P.

Seeing then that a just action, according to your definition, is that which is not against the law; it is manifest that before there was a law, there could be no injustice; and therefore laws are in their nature antecedent to justice and injustice. And you cannot deny but there must be law-makers, before there were any laws, and consequently before there was any justice, (I speak of human justice); and that law-makers were before that which you call own, or property of goods or lands, distinguished by *meum*, *tuum*, *alienum*.

L.

That must be granted; for without statute-laws, all men have right to all things; and we have had experience, when our laws were silenced by civil war, there was not a man, that of any goods could say assuredly they were his own.

P.

You see then that no private man can claim a propriety in any lands, or other goods, from any title from any man but the King, or them that have the sovereign power; because it is in virtue of the sovereignty, that every man may not enter into and possess what he pleaseth; and consequently to deny the sovereign anything necessary to the sustaining of his sovereign power, is to destroy the propriety he pretends to. The next thing I will ask you is, how you distinguish between law and right, or *lex* and *jus*.

L.

Sir Edward Coke in divers places makes *lex* and *jus* to be the same, and so *lex communis* and *jus communis*, to be all one; nor do I find that he does

in any place distinguish them.

P.

Then will I distinguish them, and make you judge whether my distinction be not necessary to be known by every author of the common-law. For law obligeth me to do, or forbear the doing of something; and therefore it lays upon me an obligation. But my right is a liberty left me by the law to do any thing which the law forbids me not, and to leave undone any thing which the law commands me not. Did Sir Edward Coke see no difference between being bound and being free?

L.

I know not what he saw, but he has not mentioned it. Though a man may dispense with his own liberty, he cannot do so with the law.

P.

But what are you better for your right, if a rebellious company at home, or an enemy from abroad, take away the goods, or dispossess you of the lands you have a right to? Can you be defended or repaired, but by the strength and authority of the King? What reason therefore can be given by a man that endeavours to preserve his propriety, why he should deny or malignly contribute to the strength that should defend him or repair him? Let us see now what your books say to this point, and other points of the right of sovereignty. Bracton, the most authentic author of the common law, (fol. 55), saith thus: *Ipse Dominus Rex habet omnia jura in manu sua, sicut Dei vicarius; habet etiam ea quæ sunt pacis; habet etiam coercionem, ut delinquentes puniat; item habet in potestate sua leges. Nihil enim prodest jura condere, nisi sit qui jura tueatur.* That is to say: Our Lord the King hath all right in his own hands; is God's vicar; he has all that concerns the peace; he has the power to punish delinquents; all the laws are in his power: to

make laws is to no purpose, unless there be somebody to make them obeyed. If Bracton's law be reason, as I and you think it is, what temporal power is there which the King hath not? Seeing that at this day all the power spiritual, which Bracton allows the Pope, is restored to the crown; what is there that the King cannot do, excepting sin against the law of God? The same Bracton, (lib. ii. c. 8, fol. 5), saith thus: *Si autem a Rege petatur, cum breve non currat contra ipsum, locus erit supplicationi quod factum suum corrigat et emendet; quod quidem si non fecerit, satis sufficit ei ad pœnam, quod Dominum expectet ultorem: nemo quidem de factis suis præsumat disputare, multo fortius contra factum suum venire.* That is to say: If any thing be demanded of the King, seeing a writ lieth not against him, he is put to his petition, praying him to correct and amend his own fact; which if he will not do, it is a sufficient penalty for him, that he is to expect a punishment from the Lord: no man may presume to dispute of what he does, much less to resist him. You see by this, that this doctrine concerning the rights of sovereignty, so much cried down by the Long Parliament, is the ancient common-law, and that the only bridle of the Kings of England, ought to be the fear of God. And again, Bracton, (lib. ii. c. 24, fol. 55), says, that the rights of the Crown cannot be granted away: *Ea vero quæ jurisdictionis sunt et pacis, et ea quæ sunt justitiæ et paci annexa, ad nullum pertinent nisi ad coronam et dignitatem Regiam, nec a corona separari poterunt, nec a privata persona possideri.* This is to say: those things which belong to jurisdiction and peace, and those things that are annexed to justice and peace, appertain to none but to the crown and dignity of the King, nor can be separated from the crown, nor be possessed by a private person. Again, you will find in Fleta, a law-book written in the time of Edward II, that liberties, though granted by the King, if they tend to the hinderance of justice, or subversion of the regal power, were not to be used, nor allowed; for in that book, (lib. i. c. 20, § 54) concerning articles of the

crown, which the justices itinerant are to enquire of, the 54th article is this: You shall inquire, *de libertatibus concessis quæ impediunt communem justitiam, et Regiam potestatem subvertunt*. Now what is a greater hinderance to common justice, or a greater subversion of the regal power, than a liberty in subjects to hinder the King from raising money necessary to suppress or prevent rebellions, which doth destroy justice, and subvert the power of the sovereignty? Moreover, when a charter is granted by the King in these words: “*Dedita etc. . . . coram etc. . . . pro me et hæredibus meis:*” the grantor by the common-law, as Sir Edward Coke says in his Commentaries on Littleton, is to warrant his gift; and I think it reason, especially if the gift be upon consideration of a price paid. Suppose a foreign state should lay claim to this kingdom, (it is no matter as to the question I am putting, whether the claim be unjust), how would you have the King to warrant to every freeholder in England the lands they hold of him by such a charter? If he cannot levy money, their estates are lost, and so is the King’s estate; and if the King’s estate be gone, how can he repair the value due upon the warranty? I know that the King’s charters are not so merely grants, as that they are not also laws; but they are such laws as speak not to all the King’s subjects in general, but only to his officers; implicitly forbidding them to judge or execute any thing contrary to the said grants. There be many men that are able judges of what is right reason, and what not; when any of these shall know that a man has no superior nor peer in the kingdom, he will hardly be persuaded he can be bound by any law of the kingdom, or that he who is subject to none but God, can make a law upon himself, which he cannot also as easily abrogate as he made it. The main argument, and that which so much taketh with the throng of people, proceedeth from a needless fear put into their minds by such men as mean to make use of their hands to their own ends. For if, say they, the King may notwithstanding the law do what he please, and nothing to restrain him but

the fear of punishment in the world to come, then, in case there come a king that fears no such punishment, he may take away from us, not only our lands, goods, and liberties, but our lives also if he will. And they say true; but they have no reason to think he will, unless it be for his own profit; which cannot be, for he loves his own power; and what becomes of his power when his subjects are destroyed or weakened, by whose multitude and strength he enjoys his power, and every one of his subjects his fortune? And lastly, whereas they sometimes say the King is bound, not only to cause his laws to be observed, but also to observe them himself; I think the King causing them to be observed is the same thing as observing them himself. For I never heard it taken for good law, that the King may be indicted, or appealed, or served with a writ, till the Long Parliament practised the contrary upon the good King Charles; for which divers of them were executed, and the rest by this our present King pardoned.

L.

Pardoned by the King and Parliament.

P.

By the King in Parliament if you will, but not by the King and Parliament. You cannot deny, but that the pardoning of injury belongs to the person that is injured; treason, and other offences against the peace and against the right of the sovereign, are injuries done to the King; and therefore whosoever is pardoned any such offence, ought to acknowledge he owes his pardon to the King alone: but as to such murders, felonies, and other injuries as are done to any subject how mean soever, I think it great reason that the parties endamaged ought to have satisfaction before such pardon be allowed. And in the death of a man, where restitution of life is impossible, what can any friend, heir, or other party that may appeal, require more than reasonable satisfaction some other way? Perhaps he will

be content with nothing but life for life; but that is revenge, and belongs to God, and under God to the King, and none else; therefore if there be reasonable satisfaction tendered, the King without sin, I think, may pardon him. I am sure, if the pardoning him be a sin, that neither King, nor Parliament, nor any earthly power can do it.

L.

You see by this your own argument, that the Act of Oblivion, without a Parliament, could not have passed; because, not only the King, but also most of the Lords, and abundance of common people had received injuries; which not being pardonable but by their own assent, it was absolutely necessary that it should be done in Parliament, and by the assent of the Lords and Commons.

P.

I grant it; but I pray you tell me now what is the difference between a general pardon, and an act of oblivion?

L.

The word Act of Oblivion was never in our books before; but I believe it is in yours.

P.

In the state of Athens long ago, for the abolishing of the civil war, there was an act agreed on; that from that time forward, no man should be molested for anything before that act done, whatsoever, without exception; which act the makers of it called an act of oblivion; not that all injuries should be forgotten (for then we could never have had the story), but that they should not rise up in judgment against any man. And in imitation of this act, the like was propounded, though it took no effect, upon the death of Julius Cæsar, in the senate of Rome. By such an act you may easily

conceive that all accusations for offences past were absolutely dead and buried; and yet we have no great reason to think, that the objecting one to another of the injuries pardoned, was any violation of those acts, except the same were so expressed in the act itself.

L.

It seems then that the act of oblivion was here no more, nor of other nature, than a general pardon.

P.

Since you acknowledge that in all controversies, the judicature originally belongeth to the King, and seeing that no man is able in his own person to execute an office of so much business: what order is taken for deciding of so many and so various controversies?

Of Courts.

L.

There be divers sorts of controversies, some of which are concerning men's titles to lands and goods; and some goods are corporeal, as lands, money, cattle, corn, and the like, which may be handled or seen; and some incorporeal, as privileges, liberties, dignities, offices, and many other good things, mere creatures of the law, and cannot be handled or seen; and both of these kinds are concerning meum and tuum. Others there are concerning crimes punishable divers ways: and amongst some of these, part of the punishment is some fine or forfeiture to the King; and then it is called a plea of the Crown, in case the King sue the party; otherwise it is but a private plea, which they call an appeal. And though upon judgment in an appeal the King shall have his forfeiture, yet it cannot be called a plea of the Crown, but when the Crown pleadeth for it. There be also other controversies concerning the government of the Church, in order to religion and virtuous

life. The offences both against the Crown and against the laws of the Church, are crimes; but the offences of one subject against another, if they be not against the Crown, the King pretendeth nothing in those pleas but the reparation of his subjects injured.

P.

A crime is an offence of any kind whatsoever, for which a penalty is ordained by the law of the land: but you must understand that damages awarded to the party injured, has nothing common with the nature of a penalty, but is merely a restitution or satisfaction, due to the party grieved by the law of reason, and consequently is no more a punishment than is the paying of a debt.

L.

It seems by this definition of a crime, you make no difference between a crime and a sin.

P.

All crimes are indeed sins, but not all sins crimes. A sin may be in the thought or secret purpose of a man, of which neither a judge, nor a witness, nor any man can take notice; but a crime is such a sin as consists in an action against the law, of which action he can be accused, and tried by a judge, and be convinced or cleared by witnesses. Farther; that which is no sin in itself, but indifferent, may be made sin by a positive law: as when the statute was in force that no man should wear silk in his hat, after the statute such wearing of silk was a sin, which was not so before. Nay, sometimes an action that is good in itself, by the statute law may be made a sin; as if a statute should be made to forbid the giving of alms to a strong and sturdy beggar, such alms, after that law, would be a sin, but not before; for then it was charity, the object whereof is not the strength or other quality of the

poor man, but his poverty. Again, he that should have said in Queen Mary's time, that the Pope had no authority in England, should have been burnt at a stake; but for saying the same in the time of Queen Elizabeth, should have been commended. You see by this, that many things are made crimes, and no crime, which are not so in their own nature, but by diversity of law, made upon diversity of opinion or of interest by them which have authority: and yet those things, whether good or evil, will pass so with the vulgar, if they hear them often with odious terms recited, for heinous crimes in themselves, as many of those opinions, which are in themselves pious and lawful, were heretofore, by the Pope's interest therein, called detestable heresy. Again, some controversies are of things done upon the sea, others of things done upon the land. There need be many courts to the deciding of so many kinds of controversies. What order is there taken for their distribution?

L.

There be an extraordinary great number of courts in England. First, there be the King's courts, both for law and equity, in matters temporal; which are the Chancery, the King's Bench, the Court of Common Pleas; and, for the King's revenue, the Court of the Exchequer: and there be subjects' courts by privilege, as the Courts in London and other privileged places. And there be other courts of subjects, as the Court of Landlords, called the Court of Barons, and the Courts of Sheriffs. Also the Spiritual Courts are the King's courts at this day, though heretofore they were the Pope's courts. And in the King's courts, some have their judicature by office, and some by commission; and some authority to hear and determine, and some only to inquire, and to certify into other courts. Now for the distribution of what pleas every court may hold, it is commonly held, that all the pleas of the Crown, and of all offences contrary to the peace, are to be holden in the King's Bench, or by commissioners. For Bracton saith: Sciendum est, quod

si actiones sunt criminales, in Curia Domini Regis debent determinari; cum sit ibi pœna corporalis infligenda, et hoc coram ipso rege, si tangat personam suam, sicut crimen læsæ majestatis, vel coram justitiariis ad hoc specialiter assignatis: that is to say, that if the plea be criminal, it ought to be determined in the Court of our Lord the King, because there they have power to inflict corporal punishment; and if the crime be against his person, as the crime of treason, it ought to be determined before the King himself; or if it be against a private person, it ought to be determined by justices assigned, that is to say, before commissioners. It seems by this, that heretofore Kings did hear and determine pleas of treason against themselves, by their own persons; but it has been otherwise a long time, and is now; for it is now the office of the Lord Steward of England, in the trial of a peer, to hold that plea by a commission especially for the same. In causes concerning meum and tuum, the King may sue, either in the King's Bench, or in the Court of Common Pleas; as it appears by Fitzherbert in his *Natura Brevium*, at the writ of escheat.

P.

A king perhaps will not sit to determine of causes of treason against his person, lest he should seem to make himself judge in his own cause; but that it shall be judged by judges of his own making can never be avoided, which is all one as if he were judge himself.

L.

To the King's Bench also, I think, belongeth the hearing and determining of all manner of breaches of the peace whatsoever, saving always to the King that he may do the same, when he pleaseth, by commissioners. In the time of Henry III and Edward I (when Bracton wrote) the King did usually send down every seven years into the country, commissioners called justices itinerant, to hear and determine generally all causes temporal, both

criminal and civil; whose places have been now a long time supplied by the justices of assize, with commissions of the peace of oyer and terminer, and of gaol-delivery.

P.

But why may the King only sue in the King's Bench or Court of Common Pleas, which he will, and no other person may do the same?

L.

There is no statute to the contrary, but it seemeth to be the common-law. For Sir Edward Coke (ivth Instit.), setteth down the jurisdiction of the King's Bench; which, he says, has: first, jurisdiction in all pleas of the Crown. Secondly, the correcting of all manner of errors of other justices and judges, both of judgments and process, except of the Court of Exchequer, which, he says, is to this court *proprium quarto modo*. Thirdly, that it has power to correct all misdemeanours extrajudicial, tending to the breach of the peace, or oppression of the subjects, or raising of factions, controversies, debates, or any other manner of misgovernment. Fourthly, it may hold plea by writ out of the Chancery of all trespasses done *vi et armis*. Fifthly, it hath power to hold plea by bill for debt, detinue, covenant, promise, and all other personal actions. But of the jurisdiction of the King's Bench in actions real he says nothing; save, that if a writ in a real action be abated by judgment in the Court of Common Pleas, and that the judgment be by a writ of error reversed in the King's Bench, then the King's Bench may proceed upon the writ.

P.

But how is the practice?

L.

Real actions are commonly decided, as well in the King's Bench, as in the Court of Common Pleas.

P.

When the King by authority in writing maketh a Lord Chief Justice of the King's Bench; does he not set down what he makes him for?

L.

Sir Edward Coke sets down the letters-patent, whereby of ancient time the Lord Chief Justice was constituted, wherein is expressed to what end he hath his office; viz. pro conservatione nostra et tranquillitatis regni nostri, et ad justitiam universis et singulis de regno nostro exhibendam, constituimus dilectum et fidelem nostrum P.B. Justitiarium Angliæ, quamdiu nobis placuerit, Capitem, etc. that is to say, for the preservation of ourself, and of the peace of our realm, and for the doing of justice to all and singular our subjects, we have constituted our beloved and faithful P. B. during our pleasure, Chief Justice of England, &c.

P.

Methinks it is very plain by these letters-patent, that all causes temporal within the kingdom, except the pleas that belong to the Exchequer, should be decidable by this Lord Chief Justice. For as for causes criminal, and that concern the peace, it is granted him in these words, "for the conservation of our self, and peace of the kingdom," wherein are contained all pleas criminal; and, in the doing of justice to all and singular the King's subjects are comprehended all pleas civil. And as to the Court of Common Pleas, it is manifest it may hold all manner of civil pleas, except those of the Exchequer, by Magna Charta, cap. ii. So that all original writs concerning civil pleas are returnable into either of the said courts. But how is the Lord Chief Justice made now?

L.

By these words in their letters-patent: *Constituimus vos Justitiarium nostrum Capitem ad placita coram nobis tenenda, durante beneplacito nostro*: that is to say, we have made you our Chief Justice, to hold pleas before ourself, during our pleasure. But this writ, though it be shorter, does not at all abridge the power they had by the former. And for the letters-patent for the Chief Justice of the Common Pleas, they go thus: *Constituimus dilectum et fidelem, etc., Capitem Justitiarium de Communi Banco, habendum, etc., quamdiu nobis placuerit, cum vadiis et fœdis ab antiquo debitis et consuetis. Id est, We have constituted our beloved and faithful, &c., Chief Justice of the Common Bench, to have, &c., during our pleasure, with the ways and fees thereunto heretofore due, and usual.*

P.

I find in history, that there have been in England always a Chancellor and a Chief Justice of England, but of a Court of Common Pleas there is no mention before Magna Charta. Common pleas there were ever both here, and, I think, in all nations; for common pleas and civil pleas I take to be the same.

L.

Before the statute of Magna Charta, common pleas, as Sir Edward Coke granteth, (2 Inst.), might have been holden in the King's Bench; and that court being removeable at the King's will, the returns of writs were *Coram nobis ubicunque fuerimus in Anglia*; whereby great trouble of jurors ensued, and great charges of the parties, and delay of justice; and for these causes it was ordained, that the common pleas should not follow the King, but be held in a place certain.

P.

Here Sir Edward Coke declares his opinion, that no common plea can be holden in the King's Bench, in that he says they might have been holden then. And yet this doth not amount to any probable proof, that there was any Court of Common Pleas in England before Magna Charta. For this statute being to ease the jurors, and lessen the charges of parties, and for the expedition of justice, had been in vain, if there had been a Court of Common Pleas then standing; for such a court was not necessarily to follow the King, as was the Chancery and the King's Bench. Besides, unless the King's Bench, wheresoever it was, held plea of civil causes, the subject had not at all been eased by this statute. For supposing the King at York, had not the King's subjects about London, jurors and parties, as much trouble and charge to go to York, as the people about York had before to go to London? Therefore I can by no means believe otherwise, than that the erection of the Court of Common Pleas was the effect of that statute of Magna Charta, ca; and before that time not existent, though I think that for the multiplicity of suits in a great kingdom there was need of it.

L.

Perhaps there was not so much need of it as you think. For in those times the laws, for the most part, were in settling, rather than settled; and the old Saxon laws concerning inheritances were then practised, by which laws speedy justice was executed by the King's writs, in the courts of Barons, which were landlords to the rest of the freeholders; and suits of barons in County courts; and but few suits in the King's courts, but when justice could not be had in those inferior courts. But at this day there be more suits in the King's courts, than any one court can despatch.

P.

Why should there be more suits now, than formerly? For I believe this kingdom was as well peopled then as now.

L.

Sir Edward Coke (4 Inst.) assigneth for it six causes: 1. Peace. 2. Plenty. 3. The dissolution of religious houses, and dispersing of their lands among so many several persons. 4. The multitude of informers. 5. The number of concealers. 6. The multitude of attorneys.

P.

I see Sir Edward Coke has no mind to lay any fault upon the men of his own profession, and that he assigns for causes of the mischiefs, such things as would be mischief and wickedness to amend. For if peace and plenty be the cause of this evil, it cannot be removed but by war and beggary; and the quarrels arising about the lands of religious persons cannot arise from the lands, but from the doubtfulness of the laws. And for informers, they were authorized by statutes; to the execution of which statutes they are so necessary, as that their number cannot be too great; and if it be too great, the fault is in the law itself. The number of concealers are indeed a number of cozeners, which the law may easily correct. And lastly, for the multitude of attorneys, it is the fault of them that have the power to admit or refuse them. For my part, I believe that men at this day have better learned the art of cavilling against the words of a statute, than heretofore they had, and thereby encourage themselves and others to undertake suits upon little reason. Also the variety and repugnancy of judgments of common-law, do oftentimes put men to hope for victory in causes whereof in reason they had no ground at all: also the ignorance of what is equity in their own causes, which equity not one man in a thousand ever studied. And the lawyers themselves seek not for their judgments in their own breasts, but in the precedents of former judges: as the ancient judges sought the same, not in their own reason, but in the laws of the empire. Another, and perhaps the greatest cause of multitude of suits, is this, that for want of registering of

conveyances of land, which might easily be done in the townships where the lands lay, a purchase cannot easily be had which will not be litigious. Lastly, I believe the covetousness of lawyers was not so great in ancient time, which was full of trouble, as they have been since in time of peace; wherein men have leisure to study fraud, and get employment from such men as can encourage to contention. And how ample a field they have to exercise this mystery in, is manifest from this, that they have a power to scan and construe every word in a statute, charter, feoffment, lease, or other deed, evidence, or testimony. But to return to the jurisdiction of this Court of the King's Bench, where, as you say, it hath power to correct and amend the errors of all other judges, both in process and in judgments; cannot the judges of the Common Pleas correct error in process in their own courts, without a writ of error from another court?

L.

Yes; and there be many statutes which command them so to do.

P.

When a writ of error is brought out of the King's Bench, be it either error in process or in law, at whose charge is it to be done?

L.

At the charge of the client.

P.

I see no reason for that; for the client is not in fault, who never begins a suit but by the advice of his counsel, learned in the law, whom he pays for his counsel given. Is not this the fault of his counsellor? Nor when a judge in the Common Pleas hath given an erroneous sentence, is it always likely that the judge of the King's Bench will reverse the judgment, (though there be no question, but as you may find in Bracton and other learned men, he

has power to do it); because being professors of the same common-law, they are persuaded, for the most part, to give the same judgments. For example: if Sir Edward Coke, in the last term that he sat as Lord Chief Justice in the Court of Common Pleas, had given an erroneous judgment, is it likely that when he was removed, and made Lord Chief Justice of the King's Bench, he would therefore have reversed the said judgment? It is possible he might, but not very likely. And therefore I do believe there is some other power, by the King constituted, to reverse erroneous judgments, both in the King's Bench and in the Court of Common Pleas.

L.

I think not; for there is a statute to the contrary, made 4 Henry IV, ca, in these words: Whereas, as well in plea real, as in plea personal, after judgment in the court of our Lord the King, the parties be made to come upon grievous pain sometimes before the King himself, sometimes before the King's council, and sometimes to the Parliament, to answer thereof anew, to the great impoverishing of the parties aforesaid, and to the subversion of the common-law of the land, it is ordained and established, that after judgment given in the court of our Lord the King, the parties and their heirs shall be there in peace, until the judgment be undone by attain, or by error, if there be error, as hath been used by the laws in the times of the King's progenitors.

P.

This statute is so far from being repugnant to that I say, as it seemeth to me to have been made expressly to confirm the same. For the substance of the statute is, that there shall be no suit made by either of the parties for anything adjudged, either in the King's Bench, or Court of Common Pleas, before the judgment be undone by error, or corruption proved; and that this was the common-law before the making of this statute, which could not be,

except there were before this statute some courts authorized to examine and correct such errors as by the plaintiff should be assigned. The inconvenience which by this statute was to be remedied was this, that often judgment given in the King's courts, by which are meant in this place the King's Bench and Court of Common Pleas, the party against whom the judgment was given, did begin a new suit, and cause his adversary to come before the King himself. Here, by the King himself must be understood the King in person; for though in a writ by the words *coram nobis* is understood the King's Bench, yet in a statute it is never so; nor is it strange, seeing in those days the King did usually sit in court with his council to hear causes, as sometimes King James. And sometimes the same parties commenced their suit before the Privy Council, though the King were absent, and sometimes before the Parliament, the former judgment yet standing. For remedy whereof, it was ordained by this statute, that no man should renew his suit till the former judgment was undone by attaint or error; which reversing of a judgment had been impossible, if there had been no court besides the aforesaid two courts, wherein the errors might be assigned, examined, and judged; for no court can be esteemed, in law or reason, a competent judge of its own errors. There was therefore before this statute, some other court existent for the hearing of errors, and reversing of erroneous judgments. What court this was, I inquire not yet; but I am sure it could not be either the Parliament or the Privy Council, or the court wherein the erroneous judgment was given.

L.

The Doctor and Student discourses of this statute (*ca et seq.*) much otherwise than you do. For the author of that book saith, that against an erroneous judgment all remedy is by this statute taken away. And though neither reason, nor the office of a King, nor any law positive, can prohibit

the remedying of any injury, much less of an unjust sentence; yet he shows many statutes, wherein a man's conscience ought to prevail above the law.

P.

Upon what ground can he pretend, that all remedy in this case is by this statute prohibited?

L.

He says it is thereby enacted, that judgment given by the King's Courts shall not be examined in the Chancery, Parliament, nor elsewhere.

P.

Is there any mention of Chancery in this act? It cannot be examined before the King and his council, nor before the Parliament; but you see that before the statute it was examined somewhere, and that this statute will have it examined there again. And seeing the Chancery was altogether the highest office of judicature in the kingdom for matter of equity, and that the Chancery is not here forbidden to examine the judgments of all other courts, at least it is not taken from it by this statute. But what cases are there in this chapter of the Doctor and Student, by which it can be made probable, that when law and conscience, or law and equity, seem to oppugn one another, the written law should be preferred?

L.

If the defendant wage his law in an action of debt brought upon a true debt, the plaintiff hath no means to come to his debt by way of compulsion, neither by subpœna, nor otherwise; and yet the defendant is bound in conscience to pay him.

P.

Here is no preferring, that I see, of the law above conscience or equity. For the plaintiff in this case loseth not his debt for want either of law, or equity, but for want of proof; for neither law nor equity can give a man his right, unless he prove it.

L.

Also if the grand jury in attaint affirm a false verdict given by the petty jury, there is no further remedy, but the conscience of the party.

P.

Here again the want of proof is the want of remedy. For if he can prove that the verdict given was false, the King can give him remedy such way as himself shall think best, and ought to do it, in case the party shall find surety, if the same verdict be again affirmed, to satisfy his adversary for the damage and vexation he puts him to.

L.

But there is a statute made since, viz. 27 Eliz. c. 8, by which that statute of 4 Hen. IV. 23, is in part taken away. For by that statute, erroneous judgments given in the King's Bench, are by a writ of error to be examined in the Exchequer-chamber, before the justices of the Common Bench and the Barons of the Exchequer; and by the preamble of this act it appears, that erroneous judgments are only to be reformed by the High Court of Parliament.

P.

But here is no mention, that the judgments given in the Court of Common Pleas should be brought in to be examined in the Exchequer-chamber. Why therefore may not the Court of Chancery examine a judgment given in the Court of Common Pleas?

L.

You deny not but, by the ancient law of England, the King's Bench may examine the judgment given in the Court of Common Pleas.

P.

It is true. But why may not also the Court of Chancery do the same, especially if the fault of the judgment be against equity, and not against the letter of the law?

L.

There is no necessity of that; for the same court may examine both the letter and the equity of the statute.

P.

You see by this, that the jurisdiction of courts cannot easily be distinguished, but by the King himself in his Parliament. The lawyers themselves cannot do it; for you see what contention there is between courts, as well as between particular men. And whereas you say, that law of 4 Hen. IV. 23, is by that of 27 Eliz. c. 8, taken away, I do not find it so. I find indeed a diversity of opinion between the makers of the former and the latter statute, in the preamble of the latter and conclusion of the former. The preamble of the latter is, forasmuch as erroneous judgments given in the Court called the King's Bench, are only to be reformed in the High Court of Parliament; and the conclusion of the former is, that the contrary was law in the times of the King's progenitors. These are no parts of those laws, but opinions only concerning the ancient custom in that case, arising from the different opinions of the lawyers in those different times, neither commanding nor forbidding anything; though of the statutes themselves, the one forbids that such pleas be brought before the Parliament, the other forbids it not. But yet, if after the act of Hen. IV such a plea had been

brought before the Parliament, the Parliament might have heard and determined it. For the statute forbids not that; nor can any law have the force to hinder the Parliament of any jurisdiction whatsoever they please to take upon them, seeing it is a court of the King and of all the people together, both Lords and Commons.

L.

Though it be, yet seeing the King (as Sir Edward Coke affirms, 4 Inst.) hath committed all his power judicial, some to one court, and some to another, so as if any man would render himself to the judgment of the King, in such case where the King hath committed all his power judicial to others, such a render should be to no effect. And , he saith farther: that in this court, the Kings of this realm have sitten on the high bench, and the judges of that court on the lower bench, at his feet; but judicature belongeth only to the judges of that court, and in his presence they answer all motions.

P.

I cannot believe that Sir Edward Coke, how much soever he desired to advance the authority of himself and other justices of the common-law, could mean that the King in the King's Bench sat as a spectator only, and might not have answered all motions, which his judges answered, if he had seen cause for it. For he knew that the King was supreme judge then in all causes temporal, and is now in all causes both temporal and ecclesiastical; and that there is an exceeding great penalty ordained by the laws for them that shall deny it. But Sir Edward Coke, as he had (you see) in many places before, hath put a fallacy upon himself, by not distinguishing between committing and transferring. He that transferreth his power, hath deprived himself of it: but he that committeth it to another to be exercised in his name and under him, is still in the possession of the same power. And therefore, if a man render himself, that is to say, appealeth to the King from

any judge whatsoever, the King may receive his appeal; and it shall be effectual.

L.

Besides these two courts, the King's Bench for Pleas of the Crown, and the Court of Common Pleas for causes civil, according to the common-law of England, there is another court of justice, that hath jurisdiction in causes both civil and criminal, and is as ancient a court at least as the Court of Common Pleas, and this is the Court of the Lord Admiral; but the proceedings therein are according to the laws of the Roman empire, and the causes to be determined there are such as arise upon the marine sea: for so it is ordained by divers statutes, and confirmed by many precedents.

P.

As for the statutes, they are always law, and reason also; for they are made by the assent of all the kingdom; but precedents are judgments, one contrary to another; I mean divers men in divers ages, upon the same case give divers judgments. Therefore I will ask your opinion once more concerning any judgments besides those of the King, as to their validity in law. But what is the difference between the proceedings of the Court of Admiralty, and the Court of Common-law?

L.

One is, that the Court of Admiralty proceedeth by two witnesses, without any either grandjury to indict, or petty to convict; and the judge giveth sentence according to the laws imperial, which of old time were in force in all this part of Europe, and now are laws, not by the will of any other Emperor or foreign power, but by the will of the Kings of England that have given them force in their own dominions; the reason whereof seems to be, that the causes that arise at sea are very often between us, and people of

other nations, such as are governed for the most part by the self-same laws imperial.

P.

How can it precisely enough be determined at sea, especially near the mouth of a very great river, whether it be upon the sea, or within the land? For the rivers also are, as well as their banks, within or a part of one country or other.

L.

Truly the question is difficult; and there have been many suits about it, wherein the question has been, whose jurisdiction it is in.

P.

Nor do I see how it can be decided but by the King himself, in case it be not declared in the Lord Admiral's letters-patent.

L.

But though there be in the letters-patent a power given to hold plea in some certain cases, not contrary to any of the statutes concerning the Admiralty, the justices of the common-law may send a prohibition to that court, to proceed in the plea, though it be with a non-obstante of any statute.

P.

Methinks that that should be against the right of the Crown, which cannot be taken from it by any subject. For that argument of Sir Edward Coke's, that the King has given away all his judicial power, is worth nothing: because, as I have said before, he cannot give away the essential rights of his Crown, and because by a non-obstante he declares he is not deceived in his grant.

L.

But you may see by the precedents alleged by Sir Edward Coke, the contrary has been perpetually practised.

P.

I see not that perpetually. For who can tell but there may have been given other judgments, in such cases, which have either been not preserved in the records, or else by Sir Edward Coke, because they were against his opinion, not alleged? For this is possible, though you will not grant it to be very likely. Therefore I insist only upon this, that no record of a judgment is a law, save only to the party pleading until he can by law reverse the former judgment. And as to the proceeding without juries, by two sufficient witnesses, I do not see what harm can proceed from it to the commonwealth, nor consequently any just quarrel that the justice of the common-law can have against their proceedings in the Admiralty. For the proof of the fact in both courts lieth merely on the witnesses; and the difference is no more, but that in the imperial law, the judge of the court judgeth of the testimony of the witnesses, and the jury doth it in a court of common-law. Besides, if a court of common-law should chance to encroach upon the jurisdiction of the Admiral, may not he send a prohibition to the court of common-law to forbid their proceeding? I pray you tell me what reason there is for the one, more than for the other?

L.

I know none but long custom, for I think it was never done. The highest ordinary court in England is the Court of Chancery, wherein the Lord Chancellor, or otherwise Keeper of the Great Seal, is the only judge. This court is very ancient, as appears by Sir Edward Coke, 4 Inst. , where he nameth the Chancellors of King Edgar, King Etheldred, King Edmund, and King Edward the Confessor. His office is given to him, without letters-patent, by the King's delivery to him of the Great Seal of England; and

whosoever hath the keeping of the Great Seal of England, hath the same, and the whole jurisdiction that the Lord Chancellor ever had by the statute of 5 Eliz. c. 18, wherein it is declared, that such is, and always has been the common-law. And Sir Edward Coke says, he has his name of Chancellor from the highest point of his jurisdiction, viz. a cancellando; that is, from cancelling the King's letters-patent, by drawing strokes through it like a lattice.

P.

Very pretty. It is well enough known that Cancellarius was a great officer under the Roman empire, whereof this island was once a member, and that the office came into this kingdom, either with, or in imitation of the Roman government. Also, it was long after the time of the twelve Cæsars, that this officer was created in the state of Rome. For till after Septimius Severus his time, the emperors did diligently enough take cognizance of all causes and complaints for judgments given in the Courts of the Prætors, which were in Rome the same that the judges of the common-law are here. But by the continual civil wars in after times for the choosing of Emperors, that diligence by little and little ceased. And afterwards, as I have read in a very good author of the Roman civil law, the number of complaints being much increased, and being more than the Emperor could dispatch, he appointed an officer as his clerk, to receive all such petitions; and that this clerk caused a partition to be made in a room convenient, in which partition-wall, at the heighth of a man's reach, he placed at convenient distances certain bars; so that when a suitor came to deliver his petition to the clerk, who was sometimes absent, he had no more to do but to throw in his petition between those bars, which in Latin are called properly cancelli; not that any certain form of those bars, or any bars at all were necessary, for they might have been thrown over, though the whole space had been left open; but because they were cancelli, the clerk attendant, and keeping his office there, was

called Cancellarius. And any court bar may properly enough be called cancelli, which does not signify a lattice; for that is but a mere conjecture grounded upon no history nor grammar, but taken up at first, as is likely, by some boy that could find no other word in the dictionary for a lattice, but cancelli. The office of this Chancellor was at first but to breviate the matter of the petitions, for the easing of the Emperor; but complaints increasing daily, they were too many, considering other businesses more necessary for the Emperor to determine; and this caused the Emperor to commit the determination of them to the Chancellor again. What reason doth Sir Edward Coke allege to prove, that the highest point of the Chancellor's jurisdiction is to cancel his master's letters-patent, after they were sealed with his master's seal; unless he hold plea concerning the validity of them, or of his master's meaning in them, or of the surreptitious getting of them, or of the abusing of them, which are all causes of equity? Also, seeing the Chancellor hath his office only by the delivery of the Great Seal, without any instruction, or limitation of the process of his court to be used; it is manifest, that in all causes whereof he has the hearing, he may proceed by such manner of hearing and examining of witnesses, with jury or without jury, as he shall think fittest for the exactness, expedition, and equity of the decrees. And therefore, if he think the custom of proceeding by jury, according to the custom of England in Courts of common-law, tend more to equity, which is the scope of all the judges in the world, or ought to be, he ought to use that method; or if he think better of another proceeding, he may use it, if it be not forbidden by a statute.

L.

As for this reasoning of yours, I think it well enough. But there ought to be had also a reverend respect to customs not unreasonable; and therefore, I think, Sir Edward Coke says not amiss, that in such cases where the Chancellor will proceed by the rule of the common-law, he ought to deliver

the record in the King's Bench; and also it is necessary for the Lord Chancellor to take care of not exceeding as it is limited by statutes.

P.

What are the statutes by which his jurisdiction is limited? I know that by the 27 Eliz. c. 8, he cannot reverse a judgment given in the King's Bench for debt, detinue, &c.; nor before the statute could he ever, by virtue of his office, reverse a judgment in pleas of the Crown, given by the King's Bench, that hath the cognizance of such pleas. Nor need he; for the judges themselves, when they think there is need to relieve a man oppressed by ill witnesses, or power of great men prevailing on the jury, or by error of the jury, though it be in case of felony, may stay the execution and inform the King, who will in equity relieve him. As to the regard we ought to have to custom, we will consider of it afterwards.

L.

First, in a Parliament holden the 13th of Richard II, the Commons petitioned the King, that neither the Chancellor, nor other Chancellor, do make any order against the common-law, nor that any judgment be given without due process of law.

P.

This is no unreasonable petition; for the common-law is nothing else but equity: and by this statute it appears, that the Chancellors, before that statute, made bolder with the Courts of common-law than they did afterward; but it does not appear that common-law in this statute signifies any thing else but generally the law temporal of the realm, nor was this statute ever printed, that such as I might take notice of it. But whether it be a statute or not, I know not, till you tell me what the Parliament answered to this petition.

L.

The King's answer was, the usages heretofore shall stand, so as the King's royalty be saved.

P.

This is flatly against Sir Edward Coke, concerning the Chancery.

L.

In another Parliament, 17 Rich. II, it is enacted, at the petition of the Commons, that forasmuch as people were compelled to come before the King's Council, or in Chancery, by writs grounded upon untrue suggestions, the Chancellor for the time being, presently after such suggestions be duly found and proved untrue, shall have power to ordain and award damages according to his discretion, to him which is so travelled unduly as is aforesaid.

P.

By this statute it appears, that when a complaint is made in Chancery upon undue suggestions, the Chancellor shall have the examination of the said suggestions, and as he may award damages when the suggestions are untrue, so he may also proceed by process to the determining of the cause, whether it be real or personal, so it be not criminal.

L.

Also the Commons petitioned in a Parliament of 2 Hen. IV, (not printed) that no writs, nor privy seals, be sued out of Chancery, Exchequer, or other places, to any man to appear at a day upon a pain, either before the King and his Council, or in any other place, contrary to the ordinary course of common-law.

P.

What answer was given to this petition by the King?

L.

That such writs should not be granted without necessity.

P.

Here again, you see, the King may deny or grant any petitions in Parliament, either as he thinks it necessary, as in this place, or as he thinks it prejudicial or not prejudicial to his royalty; as in the answer of the former petition, which is a sufficient proof that no part of his legislative power, or any other essential part of royalty, can be taken from him by a statute. Now seeing it is granted that equity is the same thing with the law of reason, and seeing Sir Edward Coke (1 Inst. sec. xxi.), defines equity to be a certain reason comprehended in no writing, but consisting only in right reason, which interpreteth and amendeth the written law; I would fain know to what end there should be any other Court of Equity at all, either before the Chancellor or any other person, besides the Judges of the Civil or Common Pleas? Nay, I am sure you can allege none but this, that there was a necessity for a higher Court of Equity than the Courts of common-law, to remedy the errors in judgment given by the justices of inferior courts; and the errors in Chancery were irrevocable, except by Parliament, or by special commission appointed thereunto by the King.

L.

But Sir Edward Coke says, that seeing matters of fact by the common-law are triable by a jury of twelve men, this court should not draw the matter ad aliud examen, that is, to another kind of examination, viz. deposition of witnesses, which should be but evidence to a jury.

P.

Is the deposition of witnesses any more or less, than evidence to the Lord Chancellor? It is not therefore another kind of examination; nor is a jury more capable of duly examining witnesses than a Lord Chancellor. Besides, seeing all courts are bound to judge according to equity, and that all judges in a case of equity may sometimes be deceived, what harm is there to any man, or to the state, if there be a subordination of judges in equity, as well as of judges in common-law? Seeing it is provided by an Act of Parliament, to avoid vexation, that subpœnas shall not be granted till surety be found to satisfy the party so grieved and vexed for his damages and expenses, if so be the matter may not be made good which is contained in the bill.

L.

There is another statute of 31 Hen. VI. c. 2, wherein there is a proviso cited by Sir Edward Coke in these words: “Provided that no matter determinable by the laws of the realm, shall be by the said Act determined in other form, than after the course of the same law in the King’s Courts, having the determination of the same law.”

P.

This law was made but for seven years, and never continued by any other Parliament, and the motive of this law was the great riots, extortions, oppressions, &c. used during the time of the insurrection of John Cade, and the indictments and condemnations wrongfully had by this usurped authority. And thereupon the Parliament ordained, that for seven years following no man should disobey any of the King’s writs under the Great Seal, or should refuse to appear upon proclamation before the King’s Council, or in the Chancery, to answer to riots, extortions, &c.; for the first time he should lose, &c. Wherein there is nothing at all concerning the jurisdiction of the Chancery or any other court, but an extraordinary power given to the Chancery, and to the King’s Privy Council, to determine of

those crimes, which were not before that time triable but only by the King's Bench or special commission. For the Act was made expressly for the punishment of a great multitude of crimes committed by those who had acted under the said Cade's authority; to which Act the proviso was added which is here mentioned, that the proceedings in those Courts of Chancery, and of the King's Council, should be such as should be used in the courts, to which the said causes, before this Act was made, do belong: that is to say, such causes as were criminal, should be after the order of the King's Bench; and such causes as were not criminal, but only against equity, should be tried after the manner of the Chancery, or in some cases according to the proceedings in the Exchequer. I wonder why Sir Edward Coke should cite a statute, as this is, above two hundred years before expired, and other two petitions, as if they were statutes, when they were not passed by the King; unless he did it on purpose to diminish, as he endeavours to do throughout his Institutes, the King's authority, or to insinuate his own opinions among the people for the law of the land; for that also he endeavours by inserting Latin sentences, both in his text and in the margin, as if they were principles of the law of reason, without any authority of ancient lawyers, or any certainty of reason in themselves, to make men believe they are the very grounds of the law of England. Now as to the authority you ascribe to custom, I deny that any custom of its own nature can amount to the authority of a law. For if the custom be unreasonable, you must, with all other lawyers, confess that it is no law, but ought to be abolished; and if the custom be reasonable, it is not the custom, but the equity that makes it law. For what need is there to make reason law by any custom how long soever, when the law of reason is eternal? Besides, you cannot find it in any statute, though *lex et consuetudo* be often mentioned as things to be followed by the judges in their judgments, that consuetudines, that is to say, customs or usages, did imply any long continuance of former time; but that it signified

such use and custom of proceeding, as was then immediately in being before the making of such statute. Nor shall you find in any statute the word common-law, which may not be there well interpreted for any of the laws of England temporal; for it is not the singularity of process used in any court that can distinguish it, so as to make it a different law from the law of the whole nation.

L.

If all the courts were, as you think, courts of equity, would it not be incommodious to the commonwealth?

P.

I think not; unless perhaps you may say, that seeing the judges, whether they have many or few causes to be heard before them, have but the same wages from the King, they may be too much inclined to put off the causes they use to hear, for the easing of themselves, to some other court, to the delay of justice, and damage of the parties suing.

L.

You are very much deceived in that; for on the contrary, the contention between the courts for jurisdiction is, of who shall have most causes brought before them.

P.

I cry you mercy, I smelt not that.

L.

Seeing also all judges ought to give their sentence according to equity, if it should chance that a written law should be against the law of reason, which is equity, I cannot imagine in that case how any judgment can be righteous.

P.

It cannot be that a written law should be against reason; for nothing is more reasonable than that every man should obey the law which he hath himself assented to. But that is not always the law, which is signified by grammatical construction of the letter, but that which the legislature thereby intended should be in force; which intention, I confess, is a very hard matter many times to pick out of the words of the statute, and requires great ability of understanding, and greater meditations and consideration of such conjuncture of occasions and incommunities, as needed a new law for a remedy. For there is scarce anything so clearly written, that when the cause thereof is forgotten, may not be wrested by an ignorant grammarian, or a cavilling logician, to the injury, oppression, or perhaps destruction of an honest man. And for this reason the Judges deserve that honour and profit they enjoy. Since the determination of what particular causes every particular court should have cognizance, is a thing not yet sufficiently explained, and is in itself so difficult, as that the sages of the law themselves, (the reason Sir Edward Coke will leave to law itself), are not yet agreed upon it; how is it possible for a man who is no professed or no profound lawyer, to take notice in what court he may lawfully begin his suit, or give counsel in it to his client?

L.

I confess that no man can be bound to take notice of the jurisdiction of courts, till all the courts be agreed upon it amongst themselves; but what rule to give judgment by, a judge can have, so as never to contradict the law written, nor displease his legislator, I understand not.

P.

I think he may avoid both, if he take care by his sentence that he neither punish an innocent man, nor deprive him of his damages due from one that

maliciously sueth him without reasonable cause, which to the most of rational men and unbiassed, is not, in my opinion, very difficult. And though a judge should, as all men may do, err in his judgment, yet there is always such power in the laws of England, as may content the parties, either in the Chancery, or by commissioners of their own choosing, authorized by the King; for every man is bound to acquiesce in the sentence of the judges he chooseth.

L.

In what cases can the true construction of the letter be contrary to the meaning of the lawmaker?

P.

Very many, whereof Sir Edward Coke nameth three: fraud, accident, and breach of confidence. But there be many more; for there be a very great many reasonable exceptions almost to every general rule, which the makers of the rule could not foresee; and very many words in every statute, especially long ones, that are, as to grammar, of ambiguous signification, and yet to them that know well to what end the statute was made, perspicuous enough; and many connexions of doubtful reference, which by a grammarian may be cavilled at, though the intention of the lawmaker be never so perspicuous. And these are the difficulties which the judges ought to master, and can do it in respect of their ability for which they are chosen, as well as can be hoped for; and yet there are other men can do the same, or else the judges' places could not be from time to time supplied. The bishops commonly are the most able and rational men, and obliged by their profession to study equity, because it is the law of God; and are therefore capable of being judges in a court of equity. They are the men that teach the people what is sin; that is to say, they are the doctors in cases of conscience. What reason then can you show me, why it is unfit and hurtful to the

commonwealth that a bishop should be a Chancellor; as they were most often before the time of Henry VIII, and since that time once in the reign of King James?

L.

But Sir Edward says, that soon after that a Chancellor was made which was no professor of the law, he finds in the rolls of the Parliament a grievous complaint by the whole body of the realm, and a petition that the most wise and able men within the realm might be chosen Chancellors.

P.

That petition was reasonable; but it does not say which are the abler men, the judges of the common-law, or the bishops.

L.

That is not the great question as to the ability of a judge; both of one and the other, there are able men in their own way. But when a judge of equity has need, almost in every case, to consider as well the statute-law, as the law of reason, he cannot perform his office perfectly, unless he be also ready in the statutes.

P.

I see no great need he has to be ready in the statutes. In the hearing of a cause, do the judges of the common-law inform the counsel at the bar what the statute is, or the counsel the judges?

L.

The counsel inform the judges.

P.

Why may they not as well inform the Chancellor? Unless you will say, that a bishop understands not as well as a lawyer what is sense, when he hears it read in English. No, no; both the one and the other are able enough: but to be able enough is not enough, when not the difficulty of the case only, but also the passion of the judge is to be conquered. I forgot to tell you of the statute of 36 Edw.III,c.9, that if any person thinking himself grieved contrary to any of the articles above-written, or others contained in divers statutes, will come to the Chancery, or any for him, and thereof make his complaint, he shall presently there have remedy by force of the said articles and statutes, without elsewhere pursuing to have remedy. By the words of this statute it is very apparent, in my opinion, that the Chancery may hold plea upon the complaint of the party grieved, in any case triable at the common-law; because the party shall have present remedy in that court, by force of this Act, without pursuing for remedy elsewhere.

L.

Yes; but Sir Edward Coke (4 Inst.) answers this objection in this manner. These words, says he, he shall have remedy, signify no more but that he shall have presently there a remedial writ grounded upon those statutes, to give him remedy at the common-law.

P.

Very like Sir Edward Coke thought, as soon as the party had his writ, he had his remedy, though he kept the writ in his pocket without pursuing his complaint elsewhere: or else he thought, that the Common-bench was not elsewhere than in the Chancery.

L.

Then there is the Court of —

P.

Let us stop here; for this which you have said satisfies me, that seek no more than to distinguish between justice and equity; and from it I conclude, that justice fulfils the law, and equity interprets the law, and amends the judgments given upon the same law. Wherein I depart not much from the definition of equity cited in Sir Edward Coke (1 Inst. sec .xxi.); viz. equity is a certain perfect reason, that interpreteth and amendeth the law written; though I construe it a little otherwise than he would have done; for no one can mend a law but he that can make it, and therefore I say it amends not the law, but the judgments only when they are erroneous. And now let us consider of crimes in particular, the pleas whereof are commonly called the Pleas of the Crown, and of the punishments belonging to them. And first of the highest crime of all, which is high-treason. Tell me, what is high-treason?

L.

The first statute that declareth what is high-treason, is the statute of the 25 Edw. III, in these words: “Whereas divers opinions have been before this time, in what case treason shall be said, and in what not; the King, at the request of the Lords and of the Commons, hath made declaration in the manner as hereafter follows: that is to say, when a man doth compass or imagine the death of our Lord the King, of our Lady the Queen, or of their eldest son and heir; or if a man doth violate the King’s companion, or the King’s eldest daughter unmarried, or the wife of the King’s eldest son and heir; or if a man do levy war against our Lord the King in his realm, or be adherent to the King’s enemies in his realm, giving to them aid and comfort in the realm or elsewhere; and thereof be provably attainted by open deed by people of their condition: and if a man counterfeit the King’s Great or Privy Seal, or his money: and if a man bring false money into this realm counterfeit to the money of England, as the money called Lushburgh, or other like to the said money of England, knowing the money to be false, to

merchandize, and make payment in deceit of our said Lord the King, and of his people: and if a man slay the Chancellor, Treasurer, or the King's Justices of one Bench or the other, Justices in Eyre, or Justices of Assizes, and all other justices assigned to hear and determine, being in their places and doing their offices. And is to be understood in the cases above rehearsed, that that ought to be adjudged treason, which extends to our royal Lord the King, and his royal Majesty; and of such treason the forfeiture of the escheats pertains to our Lord the King, as well the lands and tenements holden of others, as himself. And moreover there is another manner of treason; that is to say, when a servant slayeth his master, or a wife her husband; or when a man, secular or religious, slayeth his prelate, to whom he oweth faith and obedience; and of such treason the escheats ought to pertain to every Lord of his own fee. And because many other like cases of treason may happen in time to come, which a man cannot think nor declare at this present time, it is accorded, that if any case supposed treason, which is not above specified, doth happen before any justices, the justices shall tarry without giving any judgment of the treason, till the cause be showed and declared before the King and his Parliament, whether it ought to be adjudged treason or other felony."

Of crimes capital.

P.

I desired to understand what treason is, wherein no enumeration of facts can give me satisfaction. Treason is a crime of itself, *malum in se*, and therefore a crime at the common-law; and high-treason the highest crime at the common-law that can be. And therefore not the statute only, but reason without a statute makes it a crime. And this appears by the preamble, where it is intimated, that all men, though of divers opinions, did condemn it by the name of treason, though they knew not what treason meant, but were forced to request the King to determine it. That which I desire to know is,

how treason might have been defined without the statute, by a man that has no other faculty to make the definition of it, than by mere natural reason.

L.

When none of the lawyers have done it, you are not to expect that I should undertake it on such a sudden.

P.

You know that *salus populi* is *suprema lex*, that is to say, the safety of the people is the highest law; and that the safety of the people of a kingdom consisteth in the safety of the King, and of the strength necessary to defend his people, both against foreign enemies and rebellious subjects. And from this I infer, that to compass, that is, to design, the death of the then present King, was high treason before the making of this statute, as being a designing of a civil war and the destruction of the people. 2. That the design to kill the King's wife, or to violate her chastity, as also to violate the chastity of the King's heir-apparent, or of his eldest daughter unmarried, as tending to the destruction of the certainty of the King's issue, and by consequence to the raising of contentions about the Crown, and destruction of the people in succeeding time by civil war, was therefore high-treason before this statute. 3. That to levy war against the King within the realm, and aiding the King's enemies, either within or without the realm, are tending to the King's destruction or disherison, and was high-treason, before this statute, by the common-law. 4. That counterfeiting the principal seals of the kingdom, by which the King governeth his people, tendeth to the confusion of government, and consequently to the destruction of the people, and was therefore treason before the statute. 5. If a soldier design the killing of his general or other officer in time of battle, or a captain hover doubtfully with his troops, with intention to gain the favour of him that shall chance to get the victory, it tendeth to the destruction both of King and

people, whether the King be present or absent, and was high-treason before the statute. 6. If any man had imprisoned the King's person, he had made him incapable of defending his people, and it was therefore high-treason before the statute. 7. If any man had, with design to raise rebellion against the King, by words written or advisedly uttered, denied the King regnant to be their lawful King, he that wrote, preached, or spoke such words, living then under the protection of the King's laws, it had been high-treason before the statute, for the reasons aforesaid. And perhaps there may be some other cases upon this statute, which I cannot presently think upon. But the killing of a justice or other officer, as is determined by the statute, is not otherwise high-treason, but by the statute. And to distinguish that which is treason by the common-law from all other inferior crimes, we are to consider, that if such high-treason should take effect, it would destroy all laws at once; and being done by a subject, it is a return to hostility by treachery; and consequently, such as are traitors may, by the law of reason, be dealt withal as ignoble and treacherous enemies: but the greatest of other crimes, for the most part, are breaches of one only, or at least of very few laws.

L.

Whether this you say be true or false, the law is now unquestionable, by a statute made in the 1st and 2nd years of Queen Mary, whereby there is nothing to be esteemed treason, besides those few offences specially mentioned in the act of 25 Edward III.

P.

Amongst these great crimes the greatest is that which is committed by one that has been trusted and loved by him whose death he so designeth: for a man cannot well take heed of those whom he thinks he hath obliged, whereas an open enemy gives a man warning before he acteth. And this it is for which the statute hath declared, that it is another kind of treason, when a

servant killeth his master or mistress, or a wife killeth her husband, or a clerk killeth his prelate. And I should think it petty treason also, though it be not within the words of the statute, when a tenant in fee, that holdeth by homage and fealty, shall kill the lord of his fee; for fealty is an oath of allegiance to the lord of the fee; saving he may not keep his oath in any thing sworn to, if it be against the King. For homage, as it is expressed in a statute of 17 Edw. II, is the greatest submission that is possible to be made to one man by another. For the tenant shall hold his hands together between the hands of his landlord, and shall say thus; I become your man from this day forth for life, for member, and for worldly honour, and shall owe that my faith for the lands that I shall hold of you, saving the faith that I owe unto our Sovereign Lord the King, and to many other lords. Which homage, if made to the King, is equivalent to a promise of simple obedience, and if made to another lord, there is nothing excepted but the allegiance to the King; and that which is called fealty, is but the same confirmed by an oath.

L.

But Sir Edward Coke, (4 Inst.), denies that a traitor is in legal understanding the King's enemy. For enemies, saith he, be those that be out of the allegiance of the King. And his reason is, because, if a subject join with a foreign enemy, and come into England with him, and be taken prisoner here, he shall not be ransomed, or proceeded with as an enemy shall, but he shall be taken as a traitor to the King. Whereas an enemy coming in open hostility, and taken, shall either be executed by martial law, or ransomed; for he cannot be indicted of treason, for that he never was in the protection and ligeance of the King; and the indictment of the treason saith, *contra ligeantiam suam debitam*.

P.

This is not an argument worthy of the meanest lawyer. Did Sir Edward Coke think it impossible for a King lawfully to kill a man, by what death soever, without an indictment, when it is manifestly proved he was his open enemy? Indictment is a form of accusation peculiar to England, by the command of some King of England, and retained still, and therefore a law to this country of England. But if it were not lawful to put a man to death otherwise than by an indictment, no enemy could be put to death at all in other nations, because they proceed not, as we do, by indictment. Again, when an open enemy is taken and put to death by judgment of martial-law; it is not the law of the general or council of war, that an enemy shall be thus proceeded with, but the law of the King contained in their commissions; such as from time to time the Kings have thought fit, in whose will it always resteth, whether an open enemy, when he is taken, shall be put to death, or no, and by what death; and whether he shall be ransomed, or no, and at what price. Then for the nature of treason by rebellion; is it not a return to hostility? What else does rebellion signify? William the Conqueror subdued this kingdom; some he killed; some upon promise of future obedience he took to mercy, and they became his subjects, and swore allegiance to him. If therefore they renew the war against him, are they not again open enemies? Or if any of them lurking under his laws, seek occasion thereby to kill him secretly, and come to be known, may he not be proceeded against as an enemy, who, though he had not committed what he designed, yet had certainly a hostile design? Did not the Long Parliament declare all those for enemies to the state, that opposed their proceedings against the late King? But Sir Edward Coke does seldom well distinguish, when there are two divers names for one and the same thing: though one contain the other, he makes them always different; as if it could not be that one and the same man should be both an enemy and a traitor. But now let us come to his comment upon this statute. The statute says (as it is printed in

English) when a man doth compass, or imagine, the death of our Lord the King, &c. What is the meaning of the word compassing, or imagining?

L.

On this place Sir Edward Coke says, that before the making of this act, *voluntas reputabatur pro facto*, the will was taken for the deed. And so saith Bracton; *spectatur voluntas, et non exitus; et nihil interest utrum quis occidat, aut causam præbeat*, that is to say, the cause of the killing. Now Sir Edward Coke says, this was the law before the statute; and that to be a cause of the killing, is to declare the same by some open deed tending to the execution of his intent, or which might be cause of death.

P.

Is there any Englishman can understand, that to cause the death of a man, and to declare the same, is all one thing? And if this were so, and that such was the common-law before the statute, by what words in the statute is it taken away?

L.

It is not taken away, but the manner how it must be proved is thus determined, that it must be proved by some open deed, as providing of weapons, powder, poison, assaying of armour, sending of letters, &c.

P.

But what is the crime itself, which this statute maketh treason? For as I understand the words, to compass or imagine the King's death, &c. the compassing (as it is in the English) is the only thing which is made high-treason. So that not only the killing, but the design, is made high-treason; or, as it is in the French record, *fait compasser*, that is to say, the causing of others to compass or design the King's death is high-treason; and the words *par overt fait*, are not added as a specification of any treason, or other crime,

but only of the proof that is required by the law. Seeing then the crime is the design and purpose to kill the King, or cause him to be killed, and lieth hidden in the breast of him that is accused; what other proof can there be had of it than words spoken or written? And therefore, if there be sufficient witness that he by words declared that he had such a design, there can be no question, but that he is comprehended within the statute. Sir Edward Coke doth not deny, but, that if he confess this design, either by word or writing, he is within the statute. As for that common saying, that bare words may make a heretic but not a traitor, which Sir Edward Coke on this occasion maketh use of, they are to little purpose; seeing that this statute maketh not the words high-treason, but the intention, whereof the words are but a testimony: and that common saying is false as it is generally pronounced. For there were divers statutes made afterwards, though now expired, which made bare words to be treason without any other deed; as, 1 Eliz. c. 6, and 13 Eliz. c. 1, if a man should publicly preach that the King were an usurper, or that the right of the crown belonged to any other than the King that reigned, there is no doubt but it were treason, not only within this statute of Edward III, but also within the statute of 1 Edw. VI, c. 12, which are both still in force.

L.

Not only so; but if a subject should counsel any other man to kill the King, Queen, or heir-apparent to the Crown, it would at this day be adjudged high-treason; and yet it is no more than bare words. In the third year of King James, Henry Garnet, a Jesuit priest, to whom some of the gunpowder traitors had revealed their design by way of confession, gave them absolution without any caution taken for their desisting from their purpose, or other provision against the danger, and was therefore condemned and executed as a traitor, though such absolution was nothing else but bare words. Also I find in the reports of Sir John Davis, Attorney-

General for Ireland, that in the time of King Henry VI, a man was condemned of treason for saying the King was a natural fool, and unfit to govern. But yet this clause in the statute of Edw. III, viz. that the compassing there mentioned ought to be proved by some overt act, was by the framers of the statute not without great wisdom and providence inserted; for as Sir Edward Coke very well observeth, when witnesses are examined concerning words only, they never, or very rarely, agree precisely about the words they swear to.

P.

I deny not but that it was wisely enough done. But the question is not here of the treason, which is either fact or design, but of the proof, which when it is doubtful, is to be judged by a jury of twelve lawful men. Now whether think you is it a better proof of a man's intention to kill, that he declare the same with his own mouth, so as it may be witnessed, or that he provide weapons, powder, poison, or assay arms? If he utter his design by words, the jury has no more to do than to consider the legality of the witnesses, the harmony of their testimonies, or whether the words were spoken advisedly. For they might have been uttered in a disputation, for exercise only; or when he that spake them, had not the use of reason, nor perhaps any design or wish at all, towards the execution of what he talked of. But how a jury, from providing or buying of armour, or buying of gunpowder, or from any other overt act, not treason in itself, can infer a design of murdering the King, unless there appear some words also signifying to what end he made such provision, I cannot easily conceive. Therefore, as the jury on the whole matter, words and deeds, shall ground their judgment concerning design or not design, so, in reason, they ought to give verdict. But to come to the treason of counterfeiting the great or privy seal, seeing there are so many ways for a cheating fellow to make use

of these seals, to the cozening of the King and his people; why are not all such abuses high-treason, as well as the making of a false seal?

L.

So they are; for Sir Edward Coke produceth a record of one that was drawn and hanged for taking the great seal from an expired patent, and fastening it to a counterfeit commission to gather money. But he approveth not the judgment, because it is the judgment for petty treason: also, because the jury did not find him guilty of the offence laid in the indictment, which was, the counterfeiting of the great seal, but found the special matter, for which the offender was drawn and hanged.

P.

Seeing this crime of taking the great seal from one writing, and fastening it to another, was not found high-treason by the jury, nor could be found upon special matter to be the other kind of treason mentioned in the same statute; what ground had either the jury to find it treason, or the judge to pronounce sentence upon it?

L.

I cannot tell. Sir Edward Coke seems to think it a false record; for hereupon he saith, by way of admonition to the reader, that hereby it appeareth how dangerous it is to report a case by the ear.

P.

True; but he does not make it apparent that this case was untruly reported; but on the contrary, confesseth that he had persued the same record; and a man may, if it may be done without proof of the falsity, make the same objection to any record whatsoever. For my part, seeing this crime produced the same mischief that ariseth from counterfeiting, I think it reason to understand it as within the statute; and for the difference between

the punishments, which are both of them capital, I think it is not worthy to be stood upon; seeing death, which is ultimum supplicium, is a satisfaction to the law, as Sir Edward Coke himself hath in another place affirmed. But let us now proceed to other crimes.

L.

Appendant to this is another crime, called misprision of treason; which is the concealing of it by any man that knows it; and is called misprision from the French mespriser, which signifies to contemn or undervalue. For it is no small crime in any subject, so little to take to heart a known danger to the King's person, and consequently to the whole kingdom, as not to discover not only what he knows, but also what he suspecteth of the same, that the truth therefore may be examined. But for such discovery, though the thing prove false, the discoverer shall not, as I think, be taken for a false accuser; if for what he directly affirms, he produce a reasonable proof, and some probability for his suspicion. For else the concealment will seem justifiable by the interest, which is to every man allowed, in the preservation of himself from pain and damage.

P.

This I consent to.

L.

All other crimes merely temporal, are comprehended under felony or trespass.

P.

What is the meaning of the word felony? Does it signify anything that is in its own nature a crime, or that only which is made a crime by some statute? For I remember some statutes that make it felony to transport horses, and some other things, out of the kingdom; which transportation,

before such statutes were made, and after the repealing of the same, was no greater crime than any other usual traffic of a merchant.

L.

Sir Edward Coke derives the word felony from the Latin word *fel*, the gall of a living creature; and accordingly defines felony to be an act done *animo felleo*; that is to say, a bitter, a cruel act.

P.

Etymologies are no definitions, and yet when they are true, they give much light towards the finding out of a definition. But this of Sir Edward Coke's carries with it very little of probability; for there be many things made felony by the statute law, that proceed not from any bitterness of mind at all, and many that proceed from the contrary.

L.

This is matter for a critic, to be picked out of the knowledge of history and foreign languages, and you may perhaps know more of it than I do.

P.

All that I, or I think any other, can say in this matter, will amount to no more than a reasonable conjecture, insufficient to sustain any point of controversy in law. The word is not to be found in any of the old Saxon laws, set forth by Mr. Lambard, nor in any statute printed before that of Magna Charta; there it is found. Now Magna Charta was made in the time of Henry III, grandchild to Henry II, Duke of Anjou, a Frenchman born, and bred in the heart of France, whose language might very well retain many words of his ancestors the German Franks, as ours doth of the German Saxons; as also many words of the language of the Gauls, as the Gauls did retain many words of the Greek colony planted at Marseilles. But certain it is, the French lawyers at this day use the word *felon*, just as our lawyers use

the same; whereas the common people of France use the word *filou* in the same sense. But *filou* signifieth, not the man that hath committed such an act as they call felony, but the man that maketh it his trade to maintain himself by the breaking and contemning of all laws generally; and comprehendeth all those unruly people called cheaters, cutpurses, picklocks, catchcloaks, coiners of false money, forgers, thieves, robbers, murderers, and whosoever make use of iniquity on land or sea as a trade or living. The Greeks upon the coast of Asia, where Homer lived, were they that planted the colony of Marseilles. They had a word that signified the same with felon, which was *φιλήτης*, filetes; and this filetes of Homer signifies properly the same that a felon signifies with us. And therefore Homer makes Apollo to call Mercury *φιλήτην*, fileteen, and *ἄρχον φιλήτων*. I insist not upon the truth of this etymology, but it is certainly more rational than the animus felleus of Sir Edward Coke. And for the matter itself, it is manifest enough, that which we now call murder, robbery, theft, and other practices of felons, are the same that we call felony, and crimes in their own nature without the help of statute. Nor is it the manner of punishment, that distinguisheth the nature of one crime from another; but the mind of the offender and the mischief he intendeth, considered together with the circumstances of person, time, and place.

L.

Of felonies, the greatest crime is murder.

P.

And what is murder?

L.

Murder is the killing of a man upon malice forethought, as by a weapon, or by poison, or any way, if it be done upon antecedent meditation; or thus,

murder is the killing of a man in cold blood.

P.

I think there is a good definition of murder set down by statute, 52 Henry III, c. 25, in these words: Murder, from henceforth, shall not be judged before our justices, where it is found misfortune only, but it shall take place in such as are slain by felony, and not otherwise. And Sir Edward Coke interpreting this statute, 2 Inst. , saith, that the mischief before this statute was, that he that killed a man by misfortune, as by doing any act that was not against law, and yet against his intent the death of a man ensued, this was adjudged murder. But I find no proof of that he allegeth, nor find I any such law among the laws of the Saxons set forth by Mr. Lambard. For the word, it is, as Sir Edward Coke noteth, old Saxon, and amongst them it signified no more than a man slain in the field or other place, the author of his death not known. And according hereunto, Bracton, who lived in the time of Magna Charta, defineth it, fol. 134, thus: Murder is the secret killing of a man, when none besides the killer and his companions saw or knew it; so that it was not known who did it, nor fresh suit could be made after the doer. Therefore, every such killing was called murder, before it could be known whether it could be by felony or not; for a man may be found dead that kills himself, or was lawfully killed by another. This name of murder came to be the more horrid, when it was secretly done, for that it made every man to consider of their own danger, and him that saw the dead body, to boggle at it, as a horse will do at a dead horse. And to prevent the same, they had laws in force, to amerce the hundred where it was done, in a sum defined by law to be the price of his life. For in those days, the lives of all sorts of men were valued by money, and the value set down in their written laws. And therefore Sir Edward Coke was mistaken, in that he thought that killing a man by misfortune before the statute of Marlebridge, was adjudged murder. And those secret murders were abominated by the people, for that

they were liable to so great a pecuniary punishment for suffering the malefactor to escape. But this grievance was by Canutus, when he reigned, soon eased. For he made a law, that the county in this case should not be charged, unless he were an Englishman that was so slain; but if he were a Frenchman, (under which name were comprehended all foreigners, and especially the Normans,) though the slayer escaped, the county was not to be amerced. And this law, though it were very hard and chargeable, when an Englishman was so slain, for his friend to prove he was an Englishman, and also unreasonable to deny the justice to a stranger, yet was it not repealed till the 14th Edw. III. By this you see that murder is distinguished from homicide by the statute laws, and not by any common-law without the statute; and that it is comprehended under the general name of felony.

L.

And so also is petit treason: and I think so is high-treason also. For in the abovesaid statute in the 25th Edw. III, concerning treasons, there is this clause: And because that many other like cases of treason may happen in time to come, which a man cannot think or declare at the present time; it is accorded, that if any other case, supposed treason, which is not above specified, doth happen before any of the justices, the justices shall tarry without any going to judgment of the treason, till the cause be shewed and declared before the King and his Parliament, whether it be treason or other felony. Which thereby shews that the King and Parliament thought that treason was one of the sorts of felony.

P.

And so think I.

L.

But Sir Edward Coke denies it to be so at this day. For (1 Inst. sec. 745) at the word felony, he saith, that in ancient time this word felony was of so large an extent, as that it included high-treason; but afterwards it was resolved, that in the King's pardon or charter, this word felony should extend only to common felonies; and at this day, under the word felony, by law is included petite treason, murder, homicide, burning of houses, burglary, robbery, rape, &c. chance medley, se defendendo, and petite larceny.

P.

He says it was resolved: but by whom?

L.

By the justices of assize in the time of Henry IV, as it seems in the margin.

P.

Have justices of assize any power by their commission to alter the language of the land and the received sense of words? Or in the question in what case felony shall be said, is it referred to the judges to determine; as in the question in what case treason shall be said, it is referred by the statute of Edward III to the Parliament? I think not; and yet perhaps they may be obliged to disallow a pardon of treason, when mentioning all felonies it nameth not treason, nor specifies it by any description of the fact.

L.

Another kind of homicide there is, simply called so, or by the name of manslaughter, and is not murder: and that is, when a man kills another man upon sudden quarrel, during the heat of blood.

P.

If two meeting in the street chance to strive who shall go nearest to the wall, and thereupon fighting, one of them kills the other, I believe verily he that first drew his sword, did it of malice forethought, though not long forethought; but whether it be felony or no, it may be doubted. It is true, that the harm done is the same as if it had been done by felony; but the wickedness of the intention was nothing near so great. And supposing it had been done by felony, then it is manifest, by the statute of Marlebridge, that it was very murder. And when a man for a word or a trifle shall draw his sword and kill another man, can any man imagine that there was not some precedent malice?

L.

It is very likely there was malice, more or less: and therefore the law hath ordained for it a punishment equal to that of murder, saving that the offender shall have the benefit of his clergy.

P.

The benefit of clergy comes in upon another account, and importeth not any extenuation of the crime. For it is but a relic of the old usurped papal privilege, which is now by many statutes so pared off, as to spread but to few offences, and is become a legal kind of conveying mercy, not only to the clergy, but also to the laity.

L.

The work of a judge, you see, is very difficult, and requires a man that hath a faculty of well distinguishing of dissimilitudes in such cases as common judgments think to be the same. A small circumstance may make a great alteration; wherefore a man that cannot well discern, ought not to take upon him the office of a judge.

P.

You say very well; for if judges were to follow one another's judgments in precedent cases, all the justice in the world would at length depend upon the sentence of a few learned, or unlearned, ignorant men, and have nothing at all to do with the study of reason.

L.

A third kind of homicide is when a man kills another, either by misfortune, or in the necessary defence of himself, or of the King, or of his laws; for such killing is neither felony nor crime, saving, as Sir Edward Coke says (3 Inst.), that if the act that a man is doing, when he kills another man, be unlawful, then it is murder. As, if A meaning to steal a deer in the park of B, shooteth at the deer, and by the glance of the arrow killeth a boy that is hidden in a bush, this is murder, for that the act was unlawful; but if the owner of the park had done the like, shooting at his own deer, it had been by misadventure, and no felony.

P.

This is not so distinguished by any statute, but is the common-law only of Sir Edward Coke. I believe not a word of it. If a boy be robbing an appletree, and falleth thence upon a man that stands under it and breaks his neck, but by the same chance saveth his own life, Sir Edward Coke, it seems, will have him hanged for it, as if he had fallen of prepensed malice. All that can be called crime in this business is but a simple trespass, to the damage perhaps of sixpence or a shilling. I confess the trespass was an offence against the law, but the falling was none, nor was it by the trespass but by the falling that the man was slain; and as he ought to be quit of the killing, so he ought to make restitution for the trespass. But I believe the cause of Sir Edward Coke's mistake was his not well understanding of Bracton, whom he cites in the margin. For, fol. 120 b. lib. iii. ca, he saith thus: *Sed hic erit distinguendum, utrum quis dederit operam rei licitæ, vel*

illicitæ; si illicitæ, ut si lapidem projiciebat quis versus locum per quem consueverunt homines transitum facere, vel dum insequitur quis equum vel bovem, et aliquis a bove vel equo percussus fuerit, et hujusmodi, hoc imputatur ei. That is: But here we are to distinguish whether a man be upon a lawful or unlawful business; if an unlawful, as he that throws a stone into a place where men use to pass; or if he chase a horse or an ox, and thereby the man be stricken by the horse or the ox; this shall be imputed to him. And it is most reasonable; for the doing of such an unlawful act as is here meant, is a sufficient argument of a felonious purpose, or at least a hope to kill somebody or other, and he cared not whom, which is worse than to design the death of a certain adversary, which nevertheless is murder. Also, on the contrary, though the business a man is doing be lawful, and it chanceth sometimes that a man be slain thereby, yet may such killing be felony. For if a carman drive his cart through Cheapside in a throng of people, and thereby he kill a man, though he bare him no malice, yet because he saw there was very great danger, it may reasonably be inferred, that he meant to adventure the killing of somebody or other, though not of him that was killed.

L.

He is a felon also that killeth himself voluntarily, and is called, not only by common lawyers, but also in divers statute laws, *felo de se*.

P.

And it is well so; for names imposed by statutes are equivalent to definitions. But I conceive not how any man can bear *animum felleum*, or so much malice towards himself, as to hurt himself voluntarily, much less to kill himself. For naturally and necessarily the intention of every man aimeth at somewhat which is good to himself, and tendeth to his preservation. And therefore, methinks, if he kill himself, it is to be presumed that he is not

compos mentis, but by some inward torment or apprehension of somewhat worse than death, distracted.

L.

Nay, unless he be compos mentis, he is not felo de se, as Sir Edward Coke saith, 3 Inst. ; and therefore he cannot be judged a felo de se, unless it be first proved he was compos mentis.

P.

How can that be proved of a man dead; especially if it cannot be proved by any witness, that a little before his death he spake as other men used to do? This is a hard place; and before you take it for common-law, it had need to be cleared.

L.

I will think on it. There is a statute of 3 Hen. VII, c. 14, which makes it felony in any of the King's household servants, under the degree of a Lord, to compass the death of any of the King's Privy Council. The words are these: That from henceforth the steward, treasurer, and comptroller of the King's house for the time being, or one of them, have full authority and power, to inquire by twelve staid men and discreet persons of the chequer-roll of the King's honourable household, if any servant, admitted to be his servant sworn, and his name put into the chequer-roll, whatsoever he be, serving in any manner, office, or room, reputed, had, or taken under the estate of a Lord, make any confederacies, compassings, conspiracies, or imaginations with any person, to destroy or murder the King, or any Lord of this realm, or any other person sworn of the King's council, steward, treasurer, or comptroller of the King's house. And if such misdoers shall be found guilty by confession, or otherwise, that the said offence shall be judged felony.

P.

It appears by this statute, that not only the compassing the death, as you say, of a privy-councillor, but also of any Lord of this realm, is felony; if it be done by any of the King's household servants, that is not a Lord.

L.

No; Sir Edward Coke upon these words, any Lord of this realm, or other person sworn of the King's council, infers (3 Inst.), that it is to be understood of such a Lord only as is a privy-councillor.

P.

For barring of the Lords of Parliament from this privilege, he strains this statute a little farther, in my opinion, than it reacheth of itself. But how are such felonies to be tried?

L.

The indictment is to be found before the steward, treasurer, and comptroller of the King's house, or one of them, by twelve of the King's household servants. The petit jury for the trial must be twelve other of the King's servants. And the judges are again the steward, treasurer, and comptroller of the King's house, or two of them; and yet I see that these men are not usually great students of the law.

P.

You may hereby be assured, that either the King and Parliament were very much overseen in choosing such officers perpetually for the time being to be judges in a trial at the common-law, or else that Sir Edward Coke presumes too much to appropriate all the judicature, both in law and equity, to the common lawyers; as if neither lay persons, men of honour, nor any of the Lords spiritual who are the most versed in the examination of equity and

cases of conscience, when they hear the statutes read and pleaded, were fit to judge of the intention and meaning of the same. I know that neither such great persons, nor bishops, have ordinarily so much spare time from their ordinary employment, as to be so skilful as to plead causes at the bar; but certainly they are, especially the bishops, the best able to judge of matters of reason, that is to say (by Sir Edward Coke's confession) of matters, except of blood, at the common-law.

L.

Another sort of felony, though without manslaughter, is robbery; and by Sir Edward Coke (3 Inst.), defined thus: Robbery by the common-law is a felony committed by a violent assault upon the person of another, by putting him in fear, and taking away from him his money, or other goods of any value whatsoever.

P.

Robbery is not distinguished from theft by any statute. Latrocinium comprehendeth them both, and both are felony, and both punished with death. And therefore to distinguish them aright is the work of reason only. And the first difference, which is obvious to all men, is that robbery is committed by force or terror, of which neither is in theft. For theft is a secret act, and that which is taken by violence or terror, either from his person, or in his presence, is still robbery. But if it be taken secretly, whether it be by day or night, from his person, or from his fold, or from his pasture, then it is called theft. It is force and fraud only, that distinguisheth between theft and robbery; both which are, by the pravity only of the intention, felony in their nature. But there be so many evasions of the law found out by evil men, that I know not, in this predicament of felony, how to place them. For suppose I go secretly, by day or night, into another man's

field of wheat, ripe and standing, and loading my cart with it I carry it away: is it theft or robbery?

L.

Neither, it is but trespass. But if you first lay down the wheat you have cut, and then throw it into your cart, and carry it away, then it is felony.

P.

Why so?

L.

Sir Edward Coke tells you the reason of it (3 Inst.). For he defineth theft to be, by the common-law, a felonious and fraudulent taking and carrying away, by any man or woman, of the mere personal goods of another, not from the person, nor by night in the house of the owner. From this definition, he argues thus, : Any kind of corn or grain, growing upon the ground, is a personal chattel, and the executors of the owner shall have them, though they be not severed; but yet no larceny can be committed of them, because they are annexed to the realty; so it is of grass standing on the ground, or of apples, or of any fruit upon the trees, &c.; so it is of a box or chest of charters, no larceny can be committed of them, because the charters concern the realty, and the box or chest though it be of great value, yet shall it be of the same nature the charters are of; *et omne magis dignum trahit ad se minus*.

P.

Is this definition drawn out of any statute, or is it in Bracton or Littleton, or any other writer upon the science of the laws?

L.

No, it is his own: and you may observe by the logic sentences dispersed through his works, that he was a logician sufficient enough to make a definition.

P.

But if his definitions must be the rule of law, what is there that he may not make felony or not felony, at his pleasure? But seeing it is not statute law that he says, it must be very perfect reason, or else no law at all; and to me it seems so far from reason, as I think it ridiculous. But let us examine it. There can, says he, be no larceny of corn, grass, or fruits that are growing, that is to say, they cannot be stolen. But why? Because they concern the realty; that is, because they concern the land. It is true, that the land cannot be stolen, nor the right of a man's tenure; but corn, and trees, and fruit, though growing, may be cut down, and carried away secretly and feloniously, in contempt and despite of the law. And are they not then stolen? And is there any act which is feloniously committed, that is not more than trespass? Can any man doubt of it, that understands the English tongue? It is true, that if a man pretend a right to the land, and on that pretence take the fruits thereof by way of taking possession of his own, it is no more than a trespass, unless he conceal the taking of them. For in that one case, he but puts the man that was in possession before, to exhibit his complaint, which purpose is not felonious, but lawful; for nothing makes a distinction between felony and not felony, but the purpose. I have heard, that if a man slander another with stealing of a tree standing, there lies no action for it. And that upon this ground: to steal a standing tree is impossible; and that the cause of the impossibility is, that a man's freehold cannot be stolen; which is a very obvious fallacy. For freehold signifieth, not only the tenement, but also the tenure; and though it be true that a tenure cannot be stolen, yet every man sees that the standing trees and corn may easily be stolen. And so far forth as trees, &c. are part of the freehold, so far

forth also, they are personal goods. For whatsoever is freehold is inheritance, and descendeth to the heir, and nothing can descend to the executors but what is merely personal. And though a box or case of evidences are to descend to the heir, yet unless you can shew me positive law to the contrary, they shall be taken into the executors' hands to be delivered to the heir. Besides, how unconscionable a thing is it, that he that steals a shilling's worth of wood, which the wind hath blown down, or which lieth rotting on the ground, should be hanged for it, and he that takes a tree, worth twenty or forty shillings, should answer only for the damage!

L.

It is somewhat hard, but it has been so practised time out of mind. Then follows sodomy, and rape, both of them felonies.

P.

I know that, and that of the former he justly says it is detestable, being in a manner an apostacy from human nature: but in neither of them is there anything of animus felleus. The statutes which make them felony, are exposed to all men's reading. But because Sir Edward Coke's commentaries upon them are more diligent and accurate than to be free from all uncleanness, let us leap over them both; observing only by the way, that he leaves an evasion for an impotent offender, though his design be the same, and pursued to the utmost of his power.

L.

Two other great felonies are, breaking and burning of houses; neither of which are defined by any statute. The former of them is by Sir Edward Coke (3 Inst.), defined thus: — Burglary is by the common-law, the breaking and entering into the mansion-house of another, in the night, with intent to kill some reasonable creature, or to commit some other felony

within the same, whether his intent be executed or not. And he defineth night to be then, when one man cannot know another's face by daylight. And for the parts of a mansionhouse, he reckoneth all houses that belong to housekeeping, as barns, stables, dairyhouses, buttery, kitchen, chambers, &c. But breaking of a house by day, though felony, and punished as burglary, is not within the statute.

P.

I have nothing to say against his interpretations here; but I like not that any private man should presume to determine, whether such or such a fact done be within the words of a statute or not, where it belongs only to a jury of twelve men to declare in their verdict, whether the fact laid open before them, be burglary, robbery, theft, or other felony. For this is to give a leading judgment to the jury, who ought not to consider any private lawyer's institutes, but the statutes themselves pleaded before them for directions.

L.

Burning, as he defines it (*ibid.*), is a felony at the common-law, committed by any that maliciously and voluntarily, in the night or day, burneth the house of an other. And he hereupon infers, if a man set fire to the house, and it takes not, that then it is not within the statute.

P.

If a man should secretly and maliciously lay a quantity of gunpowder under another man's house, sufficient to blow it up, and set a train of powder in it, and set fire to the train, and some accident hinder the effect, is not this burning? Or what is it? What crime? It is neither treason, nor murder, nor burglary, nor robbery, nor theft, nor (no damage being made) any trespass, nor contrary to any statute. And yet, seeing the common-law is

the law of reason, it is a sin, and such a sin as a man may be accused of, and convicted; and consequently a crime committed of malice prepensed. Shall he not then be punished for the attempt? I grant you that a judge has no warrant from any statute-law, common-law, or commission, to appoint the punishment; but surely the King has power to punish him, on this side of life or member, as he please; and with the assent of Parliament, if not without, to make the crime for the future capital.

L.

I know not. Besides these crimes, there is conjuration, witchcraft, sorcery and enchantment; which are capital by the statute 1 James, c. 12.

P.

But I desire not to discourse of that subject. For though without doubt there is some great wickedness signified by those crimes; yet I have ever found myself too dull to conceive the nature of them, or how the devil hath power to do many things which witches have been accused of. Let us now come to crimes not capital.

L.

Shall we pass over the crime of heresy, which Sir Edward Coke ranketh before murder? But the consideration of it will be somewhat long.

P.

Let us defer it till the afternoon.

L.

Concerning heresy, Sir Edward Coke (3 Inst.) says, that five things fall into consideration. 1. Who be the judges of heresy. 2. What shall be judged heresy. 3. What is the judgment upon a man convicted of heresy. 4. What

the law alloweth him to save his life. 5. What he shall forfeit by judgment against him.

Of heresy.

P.

The principal thing to be considered, which is the heresy itself, he leaveth out, viz. what it is; in what fact or words it consisteth; what law it violateth, statute-law or the law of reason. The cause why he omitteth it, may perhaps be this; that it was not only out of his profession, but also out of his other learning. Murder, robbery, theft, &c. every man knoweth to be evil, and are crimes defined by the statute-law, so that any man may avoid them, if he will. But who can be sure to avoid heresy, (if he but dare to give an account of his faith), unless he know beforehand what it is?

L.

In the preamble of the statute of 2 Hen. IV, c. 15, heresy is laid down, as a preaching or writing of such doctrine as is contrary to the determination of Holy Church.

P.

Then it is heresy at this day to preach or write against worshipping of Saints, or the infallibility of the Church of Rome, or any other determination of the same Church. For Holy Church, at that time, was understood to be the Church of Rome, and now with us the Holy Church I understand to be the Church of England; and the opinions in that statute are now, and were then, the true Christian faith. Also the same statute of Hen. IV declareth, by the same preamble, that the Church of England had never been troubled with heresy.

L.

But that statute is repealed.

P.

Then also is that declaration or definition of heresy repealed.

L.

What, say you, is heresy?

P.

I say, heresy is a singularity of doctrine or opinion contrary to the doctrine of another man, or men; and the word properly signifies the doctrine of a sect, which doctrine is taken upon trust of some man of reputation for wisdom, that was the first author of the same. If you will understand the truth hereof, you are to read the histories and other writings of the ancient Greeks, whose word it is; which writings are extant in these days, and easy to be had. Wherein you will find, that in and a little before the time of Alexander the Great, there lived in Greece many excellent wits, that employed their time in search of the truth in all manner of sciences worthy of their labour, and which to their great honour and applause published their writings; some concerning justice, laws, and government, some concerning good and evil manners, some concerning the causes of things natural and of events discernible by sense, and some of all these subjects. And of the authors of these, the principal were Pythagoras, Plato, Zeno, Epicurus and Aristotle, men of deep and laborious meditation, and such as did not get their bread by their philosophy, but were able to live of their own, and were in honour with princes and other great personages. But these men, though above the rest in wisdom, yet their doctrine in many points did disagree; whereby it came to pass, that such men as studied their writings, inclined some to Pythagoras, some to Plato, some to Aristotle, some to Zeno, and some to Epicurus. But philosophy itself was then so much in fashion, as that every rich man endeavoured to have his children educated in the doctrine of some or other of these philosophers, which were

for their wisdom so much renowned. Now those that followed Pythagoras, were called Pythagoreans; those that followed Plato, Academics; those that followed Zeno, Stoics; those that followed Epicurus, Epicureans; and those that followed Aristotle, Peripatetics; which are the names of heresy in Greek, which signifies no more but taking of an opinion; and the said Pythagoreans, Academics, Stoics, Peripatetics, &c. were termed by the names of so many several heresies. All men, you know, are subject to error, and the ways of error very different; and therefore it is no wonder if these wise and diligent searchers of the truth did, notwithstanding their excellent parts, differ in many points amongst themselves. But this laudable custom of great wealthy persons to have their children at any price to learn philosophy, suggested to many idle and needy fellows an easy and compendious way of maintenance; which was to teach the philosophy, some of Plato, some of Aristotle, &c: whose books to that end they read over, but without capacity or much endeavour to examine the reasons of their doctrines, taking only the conclusions, as they lay. And setting up with this, they soon professed themselves philosophers, and got to be the school-masters to the youth of Greece. But by competition for such employment, they hated and reviled one another with all the bitter terms they could invent; and very often, when upon occasion they were in civil company, fell first to disputation, and then to blows, to the great trouble of the company and their own shame. Yet amongst all their reproachful words, the name of heretic came never in, because they were all equally heretics, their doctrine not being theirs, but taken upon trust from the aforesaid authors. So that though we find heresy often mentioned in Lucian and other heathen authors, yet we shall not find in any of them hæreticus for a heretic. And this disorder among the philosophers continued a long time in Greece, and infecting also the Romans, was at the greatest in the times of the apostles and in the primitive Church, till the time of the Nicene Council, and

somewhat after. But at last the authority of the Stoics and Epicureans was not much esteemed, only Plato's and Aristotle's philosophy were much in credit; Plato's with the better sort, that founded their doctrine upon the conceptions and ideas of things, and Aristotle's with those that reasoned only from the names of things, according to the scale of the categories. Nevertheless, there were always, though not new sects of philosophy, yet new opinions continually arising.

L.

But how came the word heretic to be a reproach?

P.

Stay a little. After the death of our Saviour, his apostles and his disciples, as you know, dispersed themselves into several parts of the world to preach the Gospel, and converted much people, especially in Asia the Less, in Greece, and Italy, where they constituted many churches; and as they travelled from place to place, left bishops to teach and direct those their converts, and to appoint presbyters under them to assist them therein, and to confirm them by setting forth the life and miracles of our Saviour, as they had received them from the writings of the apostles and evangelists; whereby, and not by the authority of Plato, or Aristotle, or any other philosopher, they were to be instructed. Now you cannot doubt but that among so many heathens converted in the time of the apostles, there were men of all professions and dispositions, and some that had never thought of philosophy at all, but were intent upon their fortunes or their pleasures; and some that had a greater, some a less use of reason; and some that had studied philosophy, but professed it not, which were commonly the men of the better rank; and some had professed it only for their better abstinence, and had it not farther than readily to talk and wrangle; and some were Christians in good earnest, and others but counterfeit, intending to make use

of the charity of those that were sincere Christians, which in those times was very great. Tell me now, of these sorts of Christians, which was the most likely to afford the fittest men to propagate the faith by preaching and writing, or public or private disputation; that is to say, who were fittest to be made presbyters and bishops.

L.

Certainly those who, *cæteris paribus*, could make the best use of Aristotle's rhetoric and logic.

P.

And who were the most prone to innovation?

L.

They that were most confident of Aristotle's and Plato's (their former masters) natural philosophy. For they would be the aptest to wrest the writings of the apostles and all Scriptures to the doctrines in which their reputation was engaged.

P.

And from such bishops and priests and other sectaries it was, that heresy, amongst the Christians, first came to be a reproach. For no sooner had one of them preached or published any doctrine that displeased either the most, or the most leading men of the rest, but it became such a quarrel as not to be decided but by a Council of the bishops in the province where they lived; wherein he that would not submit to the general decree, was called a heretic, as one that would not relinquish the philosophy of his sect. The rest of the Council gave themselves the name of Catholics, and to their Church the name of Catholic Church. And thus came up the opposite terms of catholic and heretic.

L.

I understand how it came to be a reproach, but not how it follows that every opinion condemned by a Church that is, or calls itself catholic, must needs be an error or a sin. The Church of England denies that consequence, and that such doctrine as they hold cannot be proved to be erroneous but by the Scripture, which cannot err; but the Church, being but men, may both err and sin.

P.

In this case we must consider also that error, in its own nature, is no sin. For it is impossible for a man to err on purpose; he cannot have an intention to err; and nothing is sin unless there be a sinful intention: much less are such errors sins, as neither hurt the commonwealth nor any private man, nor are against any law positive or natural; such errors as were those for which men were burnt, in the time when the Pope had the government of this Church.

L.

Since you have told me how heresy came to be a name, tell me also how it came to be a crime; and what were the heresies that first were made crimes.

P.

Since the Christian Church could declare, and none else, what doctrines were heresies, but had no power to make statutes for the punishment of heretics before they had a Christian King, it is manifest that heresy could not be made a crime before the first Christian Emperor, which was Constantine the Great. In his time, one Arius, a priest of Alexandria, in dispute with his bishop publicly denied the divinity of Christ, and maintained it afterwards in the pulpit, which was the cause of a sedition and

much bloodshed both of citizens and soldiers in that city. For the preventing of the like for the time to come, the Emperor called a general Council of bishops to the city of Nice; who being met, he exhorted them to agree upon a confession of the Christian faith, promising that whatsoever they agreed on he would cause to be observed.

L.

By the way, the Emperor, I think, was here a little too indifferent.

P.

In this Council was established so much of the creed we now use and call the Nicene creed, as reacheth to the words, I believe in the Holy Ghost. The rest was established by the three general Councils next succeeding. By the words of which creed almost all the heresies then in being, and especially the doctrine of Arius, were condemned; so that now all doctrines published by writing or by word, and repugnant to this confession of the first four general Councils, and contained in the Nicene creed, were, by the imperial law forbidding them, made crimes; such as are that of Arius, denying the divinity of Christ; that of Eutiches, denying the two natures of Christ; that of the Nestorians, denying the divinity of the Holy Ghost; that of the Anthropomorphites, that of the Manichees, that of the Anabaptists, and many other.

L.

What punishment had Arius?

P.

At the first, for refusing to subscribe, he was deprived and banished; but afterwards having satisfied the Emperor concerning his future obedience (for the Emperor caused this confession to be made, not for the regard of truth of doctrine, but for the preserving of the peace, especially among his

Christian soldiers, by whose valour he had gotten the empire, and by the same was to preserve it), he was received again into grace, but died before he could repossess his benefice. But after the time of those Councils, the imperial law made the punishment for heresy to be capital, though the manner of the death was left to the prefects in their several jurisdictions; and thus it continued till somewhat after the time of the Emperor Frederick Barbarossa. But the papacy having gotten the upper hand of the Emperor, brought in the use of burning both heretics and apostates; and the Popes from time to time made heresies of many other points of doctrine (as they saw it conduce to the setting up of the chair above the throne), besides those determined in the Nicene creed, and brought in the use of burning; and according to this papal law, there was an apostate burnt at Oxford, in the time of William the Conqueror, for turning Jew. But of a heretic burnt in England, there is no mention made till after the statute of 2 Hen. IV, whereby some followers of Wicliff, called Lollards, were afterwards burned; and that for such doctrines as by the Church of England, ever since the first year of Queen Elizabeth, have been approved for godly doctrines, and no doubt were godly then. And so you see how many have been burnt for godliness.

L.

It was not well done. But it is no wonder we read of no heretics before the time of Henry IV: for in the preamble to that statute it is intimated, that before those Lollards there never was any heresy in England.

P.

I think so too; for we have been the tamest nation to the Pope of all the world. But what statutes concerning heresy have there been made since?

L.

The statute of 2 Hen. V, c. 7, which adds to the burning the forfeiture of lands and goods; and then no more till the 25 Hen. VIII, c. 14, which confirms the two former, and giveth some new rules concerning how they shall be proceeded with. But by the statute of 1 Edw. VI, c. 12, all acts of Parliament formerly made to punish any manner of doctrine concerning religion, are repealed. For therein it is ordained, after divers Acts specified, that all and every other Act or Acts of Parliament concerning doctrine or matters of religion, and all and every branch, article, sentence, and matter, pains and forfeitures contained, mentioned, or anywise declared in the same Acts of Parliament or statutes, shall be from henceforth repealed, utterly void, and of none effect. So that in the time of King Edward VI, not only all punishments of heresy were taken away, but also the nature of it was changed to what originally it was, a private opinion. Again, in 2 Phil. & M. those former statutes of 2 Hen. IV, c. 15, 2 Hen. V, c. 17, 25 Hen. VIII, c. 14, are revived; and the branch of 1 Edw. VI, c. 12, touching doctrine, though not specially named, seemeth to be this, that the same statute confirmeth the statute of 25 Edw. III, concerning treasons. Lastly, in the first year of Queen Elizabeth, c. 1, the aforesaid statutes of Queen Mary are taken away, and thereby the statute of 1 Edw. VI, c. 12, revived; so as there was no statute left for the punishment of heretics. But Queen Elizabeth by the advice of her Parliament gave a commission, which was called the High Commission, to certain persons, amongst whom were very many of the bishops, to declare what should be heresy for the future, but with a restraint that they should judge nothing to be heresy, but what had been so declared in the first four general Councils.

P.

From this which you have showed me, I think we may proceed to the examination of the learned Sir Edward Coke concerning heresy. In his chapter of heresy, 3 Inst. , he himself confesseth that no statute against

heresy stood then in force, when in the 9th year of King James, Bartholomew Legat was burnt for Arianism; and that from the authority of the act of 2 Hen. IV, c. 15, and other acts cited in the margin, it may be gathered that the diocesan hath the jurisdiction of heresy. This I say is not true: for as to acts of Parliament, it is manifest, that from acts repealed, that is to say, from things that have no being, there can be gathered nothing. And as to the other authorities in the margin, Fitzherbert and the Doctor and Student, they say no more than what was law in the time when they writ; that is, when the Pope's usurped authority was here obeyed. But if they had written this in the time of King Edward VI or Queen Elizabeth, Sir Edward Coke might as well have cited his own authority, as theirs; for their opinions had no more the force of laws than his. Then he cites this precedent of Legat, and another of Hammond in the time of Queen Elizabeth; but precedents prove only what was done, and not what was well done. What jurisdiction could the diocesan then have of heresy, when by the statute of Edw. VI, c. 12, then in force, there was no heresy, and all punishment for opinions was forbidden? For heresy is a doctrine contrary to the determination of the Church; but then the Church had not determined any thing at all concerning heresy.

L.

But seeing the high-commissioners had power to correct and amend heresies, they must have power to cite such as were accused of heresy to appear before them; or else they could not execute their commission.

P.

If they had first made and published a declaration of what articles they made heresy, that when one man heard another speak against their declaration, he might thereof inform the commissioners, then indeed they had had power to cite and imprison the person accused. But before they can

know what should be heresy, how was it possible that one man should accuse another? And before he be accused, how can he be cited?

L.

Perhaps it was taken for granted, that whatsoever was contrary to any of the four first general Councils, was to be judged heresy.

P.

That granted, yet I see not how one man might accuse another any the better for those Councils. For not one man of ten thousand had ever read them, nor were they ever published in English, that a man might avoid offending against them; nor perhaps are they extant. Nor if those that we have printed in Latin, are the very acts of the Councils, which is yet much disputed amongst divines, do I think it fit they were put in the vulgar tongues. But it is not likely that the makers of the statutes had any purpose to make heresy of whatsoever was repugnant to those four general Councils. For if they had, I believe the Anabaptists, of which there was great plenty in those times, would one time or other have been questioned upon this article of the Nicene Creed, I believe one baptism for the remission of sins. Nor was the commission itself for a long time after registered, that men might in such uncertainty take heed and abstain, for their better safety, from speaking of religion anything at all. But by what law was this hereitc Legat burnt? I grant he was an Arian, and his heresy contrary to the determination of the Church of England, in the highest points of Christianity. But seeing there was no statute-law to burn him, and no penalty forbidding, by what law, by what authority was he burnt?

L.

That this Legat was accused of heresy, was no fault of the high-commissioners; but when he was accused, it had been a fault in them not to

have examined him, or having examined him and found him an Arian, not to have judged him so, or not to have certified him so. All this they did, and this was all that belonged unto them; they meddled not with his burning, but left him to the secular power to do with him what they pleased.

P.

Your justification of the commissioners is nothing to the question. The question is by what law was he burnt? The spiritual-law gives no sentence of temporal punishment; and Sir Edward Coke confesseth that he could not be burned; and burning being forbidden by statute-law, by what law then was he burned?

L.

By the common-law.

P.

What is that? It is not custom. For before the time of Henry IV, there was no such custom in England; for if there had, yet those laws that came after were but confirmations of the custom, and therefore the repealing of those laws was a repealing of the custom. For when King Edward VI and Queen Elizabeth abolished those statutes, they abolished all pains, and consequently burning, or else they had abolished nothing. And if you will say he was burnt by the law of reason, you must tell me how there can be proportion between doctrine and burning; there can be no equality, nor majority, nor minority assigned between them. The proportion that is between them, is the proportion of the mischief which the doctrine maketh, to the mischief to be inflicted on the doctor; and this is to be measured only by him that hath the charge of governing the people; and consequently the punishing of offences can be determined by none but by the King, and that, if it extend to life or member, with the assent of Parliament.

L.

He does not draw any argument for it from reason, but allegeth for it this judgment executed upon Legat, and a story out of Holinshed and Stow. But I know that neither history nor precedent will pass with you for law. And though there be a writ de hæretico comburendo in the register, as you may read in Fitzherbert, grounded upon the statutes of 2 Hen. IV, c. 15, and 2 Hen. V, c. 7; yet seeing those statutes are void, you will say the writ is also void.

P.

Yes, indeed will I. Besides this, I understand not how that it is true that he saith, that the diocesan hath jurisdiction of heresy, and that so it was put in use in all Queen Elizabeth's reign; whereas by the statute it is manifest, that all jurisdiction spiritual was given under the Queen to the high-commissioners. How then could any one diocesan have any part thereof without deputation from them, which by their letters-patent they could not grant? Nor was it reasonable they should; for the trust was not committed to the bishops only, but also to divers lay persons, who might have an eye upon their proceedings, lest they should encroach upon the power temporal. But at this day there is neither statute nor any law to punish doctrine, but the ordinary power ecclesiastical, and that according to the canons of the Church of England, only authorized by the King, the high-commission being long since abolished. Therefore let us come now to such causes criminal as are not capital.

L.

The greatest offence not capital, is that which is done against the statute of provisors.

Of premunire.

P.

You have need to expound this.

L.

This crime is not unlike to that for which a man is outlawed, when he will not come in and submit himself to the law; saving that in outlawries there is a long process to precede it, and he that is outlawed is put out of the protection of the law. But for the offence against the statute of provisors (which is called *præmunire facias*, from the words in the original writ), if the offender submit not himself to the law within the space of two months after notice, he is presently an outlaw. And this punishment, if not capital, is equivalent to capital. For he lives secretly at the mercy of those that know where he is, and cannot, without the like peril to themselves, but discover him. And it has been much disputed, before the time of Queen Elizabeth, whether he might not be lawfully killed by any man that would, as one might kill a wolf. It is like the punishment amongst the old Romans, of being barred the use of fire and water; and like the great excommunication in the papacy, when a man might not eat nor drink with the offender without incurring the like penalty.

P.

Certainly the offence for which this punishment was first ordained was some abominable crime, or extraordinary mischief.

L.

So it was. For the Pope, you know, from long before the Conquest, encroached every day upon the power temporal. Whatsoever could be made to seem to be in *ordine ad spiritualia*, was in every commonwealth claimed and haled to the jurisdiction of the Pope; and for that end, in every country he had his court ecclesiastical, and there was scarce any cause temporal

which he could not, by one shift or other, hook into his jurisdiction, in such sort as to have it tried in his own courts at Rome, or in France, or in England itself. By which means the King's laws were not regarded, judgments given in the King's courts were avoided, and presentations to bishoprics, abbeyes, and other benefices, founded and endowed by the Kings and nobility of England, were bestowed by the Pope upon strangers, or such as with money in their purses could travel to Rome to provide themselves of such benefices. And suitably hereunto, when there was a question about a tithe, or a will, though the point were merely temporal, yet the Pope's court here would fetch them in, or else one of the parties would appeal to Rome. Against these injuries of the Roman Church, and to maintain the right and dignity of the Crown of England, Edward III made a statute concerning provisors, that is, such as provide themselves with benefices here from Rome. For in the twenty-fifth year of his reign he ordained, in a full Parliament, that the right of election of bishops, and right of advowsons and presentations, belonged to himself, and to the nobility that were the founders of such bishoprics, abbeyes, and other benefices. And he enacted further, that if any clerk which he or any of his subjects should present, should be disturbed by any such provisor, that such provisor or disturber should be attached by his body, and if convicted, lie in prison till he were ransomed at the King's will, and had satisfied the party grieved, renounced his title, and found sureties not to sue for it any further; and that if they could not be found, then exigents should go forth to outlawry, and the profits of the benefice in the mean time be taken into the King's hands. And the same statute is confirmed in the twenty-seventh year of King Edward III; which statute alloweth to these provisors two months to appear: but if they appear before they be outlawed, they shall be received to make answer; but if they render not themselves, they shall forfeit all their lands, goods, and chattels, besides that they stand outlawed. The same law is confirmed

again by 16 Rich. II, c. 5; in which is added, because these provisors obtained sometimes from the Pope, that such English bishops, as according to the law were instituted and inducted by the King's presentees, should be excommunicated, that for this also both they, and the receivers and publishers of such papal process, and the procurers, should have the same punishment.

P.

Let me see the statute itself of 27 Edw. III.

L.

It lies there before you, set down verbatim by Sir Edward Coke himself, both in English and French.

P.

It is well. We are now to consider what it means, and whether it be well or ill interpreted by Sir Edward Coke. And first it appeareth by the preamble, which Sir Edward Coke acknowledgeth to be the best interpreter of the statute, that this statute was made against the encroachments only of the Church of Rome upon the right of the King, and other patrons, to collate bishoprics and other benefices within the realm of England, and against the power of the courts spiritual to hold plea of controversies determinable in any of the courts of the King, or to reverse any judgment there given, as being things that tend to the disherison of the King and destruction of the common-law of the realm always used. Put the case now, that a man had procured the Pope to reverse a decree in chancery. Had he been within the danger of *præmunire*?

L.

Yes, certainly. Or if the judgment had been given in the Court of the Lord Admiral, or in any other King's court whatsoever, either of law or

equity. For courts of equity are most properly courts of the common-law of England, because equity and common-law, as Sir Edward Coke says, are all one.

P.

Then the word common-law is not in this preamble restrained to such courts only where the trial is by juries, but comprehends all the King's temporal courts, if not also the courts of those subjects that are lords of great manors.

L.

It is very likely, yet I think it will not by every man be granted.

P.

The statute also says, that they who draw men out of the realm in plea, whereof the cognizance pertaineth to the King's court, or of things whereof judgment is given in the King's court, are within the cases of præmunire. But what if one man draw another to Lambeth in plea, whereof judgment is already given at Westminster. Is he by this clause involved in a præmunire?

L.

Yes. For though it be not out of the realm, yet it is within the meaning of the statute; because the Pope's court, not the King's court, was then perhaps at Lambeth.

P.

But in Sir Edward Coke's time the King's court was at Lambeth, and not the Pope's.

L.

You know well enough that the spiritual Court has no power to hold pleas of common-law.

P.

I do so; but I know not for what cause any simple man, that mistakes his right court, should be out of the King's protection, lose his inheritance and all his goods, personal and real, and if taken, be kept in prison all his life. This statute cannot be by Sir Edward Coke's torture made to say it. Besides, such men are ignorant in what courts they are to seek their remedy; and it is a custom confirmed by perpetual usage, that such ignorant men should be guided by their counsel at law. It is manifest, therefore, that the makers of the statute intended not to prohibit men from suing for their right, neither in the Chancery, nor in the Admiralty, nor in any other court, except the Ecclesiastical courts, which had their jurisdiction from the Church of Rome. Again, where the statute says, "which do sue in any other court, or defeat a judgment in the King's court": what is the meaning of another court? Another court than what? Is it here meant the King's Bench, or Court of Common Pleas? Does a *præmunire* lie for every man that sues in Chancery for that which might be remedied in the Court of Common Pleas? Or can a *præmunire* lie by this statute against the Lord Chancellor? The statute lays it only on the party that sueth, not upon the judge which holdeth the plea. Nor could it be laid, either by this statute or by the statute of 16 Rich. II, upon the judges, which were then punishable only by the Pope's authority. Seeing then the party suing has a just excuse upon the counsel of his lawyer, and the temporal judge and the lawyer both are out of the statute, the punishment of the *præmunire* can light upon nobody.

L.

But Sir Edward Coke in this same chapter bringeth two precedents to prove, that though the spiritual courts in England be now the King's courts,

yet whosoever sueth in them for any thing triable by the common-law, shall fall into a præmunire. One is, that whereas in the twenty-second year of Hen. VIII all the clergy of England in a convocation by public instrument acknowledged the King to be supreme head of the Church of England; yet after this, viz. 24 Hen. VIII, this statute was in force.

P.

Why not? A convocation of the clergy could not alter the right of supremacy; their courts were still the Pope's courts. The other precedent, in the twenty-fifth year of Hen. VIII, of the Bishop of Norwich, may have the same answer. For the King was not declared head of the Church by Act of Parliament till the twenty-sixth year of his reign. If he had not mistrusted his own law, he would not have laid hold on so weak a proof as these precedents. And as to the sentence of præmunire upon the Bishop of Norwich, neither doth this statute nor that other of Richard II warrant it. He was sentenced for threatening to excommunicate a man which had sued another before the mayor. But this statute forbids not that, but forbids the bringing in or publishing of excommunications, or other process from Rome, or any other place. Before the twenty-sixth year of Henry VIII, there is no question but that for a suit in the spiritual court here in a temporal cause there lay a præmunire. And if perhaps some judge or other hath since that time judged otherwise, his judgment was erroneous.

L.

Nay, but by the statute of 16 Rich. II. c. 5, it appeareth to the contrary, as Sir Edward Coke here will show you. The effect, saith he, of the statute of Richard II is, that if any pursue, or cause to be pursued, in the Court of Rome or elsewhere, anything which toucheth the King, against him, his crown, or regality, or his realm, they, their notaries, &c. shall be out of the King's protection.

P.

I pray you let me know the very words of the statute as they lie.

L.

Presently. The words are, If any man purchase or pursue, or cause to be purchased or pursued, in the Court of Rome or elsewhere, any such translations, processes and sentences of excommunication, bulls, instruments, or any other things whatsoever, which touch the King, against him, his crown, and his regality, or his realm, as is aforesaid, &c.

P.

If a man bring a plea of common-law into the spiritual court, which is now the King's court, and the judge of this spiritual court hold plea thereof: by what construction can you draw it within the compass of the words you have now read? To sue for my right in the King's court, is no pursuing of translations of bishoprics, made or procured in the Court of Rome, or any place else, but only in the court of the King; nor is this the suit against the King, nor his crown, nor his regality, nor his realm, but the contrary. Why then is it a præmunire? No. He that brings in or setteth out a writing in any place whatsoever, wherein is contained, that the King hath so given away his jurisdiction, as that if a subject be condemned falsely, his submission to the King's judgment is of none effect; or that the King upon no necessity whatsoever can out of Parliament-time raise money for the defence of the kingdom, is, in my opinion, much more within the statute of provisors, than they which begin suit for a temporal matter in a court spiritual. But what argument has he for this law of his, since the statute-law fails him, from the law of reason?

L.

He says, they are called other courts, either because they proceed by the rules of other laws, as by the canon or civil law, or by other trials than the common-law doth warrant. For the trial warranted by the law of England for matter of fact, is by verdict of twelve men before the judges of the common-law, in matters pertaining to the common-law, and not upon examination of witnesses, as in the Court of Equity. So that *alia curia* is either that which is governed *per aliam legem*, or which draweth the party *ad aliud examen*. For if —

P.

Stop there. Let us consider of this you have read: for the trial warranted by the law of England is by verdict of twelve men. What means he here by the law of England? Does it not warrant the trials in Chancery, and in the Court of Admiralty, by witnesses?

L.

By the law of England he means the law used in the King's Bench; that is to say, the common-law.

P.

This is just as if he had said, that two courts did warrant their own way of trial; but other courts not so, but were warranted by the King: only the courts of common-law were warrants to themselves. You see that *alia curia* is this way ill expounded. In the courts of common-law all trials are by twelve men, who are judges of the fact; and the fact known and proved, the judges are to pronounce the law; but in the spiritual court, the Admiralty, and in all the courts of Equity, there is but one judge, both of fact and of law; this is all the difference. If this difference be intended by the statute by *alia curia*, there would be a *præmunire* for suing in a court, being not the King's Court. The King's Bench and Court of Common Pleas may also be

different kinds of courts, because the process is different. But it is plain that this statute doth not distinguish courts otherwise than into the courts of the King, and into the courts of the foreign states and princes. And seeing you stand upon the name of a jury for the distinguishing of courts, what difference do you find between the trials at the common-law, and the trials in other courts? You know that in trials of fact naturally, and through all the world, the witnesses are judges, and it is impossible to be otherwise. What then in England can a jury judge of, except it be of the sufficiency of the testimony? The justices have nothing to judge of or do, but after the fact is proved, to declare the law; which is not judgment, but jurisdiction. Again, though the trial be in Chancery, or in the Court of civil law, the witnesses are still judges of the fact, and he that hath the commission to hear the cause, hath both the parts, that is to say, of a jury to judge of the testimony, and of a justice to declare the law. In this, I say, lies all the difference: which is indeed enough to make a dispute (as the world goes) about jurisdiction! But seeing it tends neither to the disherison of the King, nor of the people, nor to the subversion of the law of reason, that is of common-law, nor to the subversion of justice, nor to any harm of the realm, without some of which these statutes are not broken; it cannot be a *præmunire*.

L.

Let me read on. For if the freehold, inheritances, goods and chattels, debts and duties, wherein the King and subject have right and property by the common-law, should be judged *per aliam legem*, or be drawn *ad aliud examen*, the three mischiefs afore expressed would follow; viz. the destruction of the King and his crown, the disherison of his people, and the undoing and destruction of the common-law always used.

P.

That is to say, of the law of reason. From hence it follows, that where there are no juries, and where there are different laws from ours, that is to say, in all the world besides, neither King nor people have any inheritance, nor goods, nor any law of reason. I will examine his doctrine concerning cases criminal no further. He nowhere defineth a crime, that we may know what it is: an odious name sufficeth him to make a crime of any thing. He hath put heresy among the most odious crimes, not knowing what it signifies; and upon no other cause, but because the Church of Rome, to make their usurped power the more terrible, had made it, by long preaching against it, and cruelty shown towards many godly and learned men of this and other reformed Churches, appear to common people a thing detestable. He puts it in as a plea of the crown in the time of Queen Elizabeth; whereas in her time there was no doctrine heresy. But Justice Stamford leaves it out, because, when heresy was a crime, it was a plea of the mitre. I see also in this catalogue of causes criminal, he inserteth costly feeding, costly apparel, and costly building, though they were contrary to no statute. It is true, that by evil circumstances they become sins; but these sins belong to the judgment of the pastors spiritual. A justice of the temporal law (seeing the intention only makes them sins) cannot judge whether they be sins or no, unless he have power to take confessions. Also he makes flattery of the King to be a crime. How could he know when one man had flattered another? He meant therefore that it was a crime to please the King: and accordingly he citeth divers calamities of such as had been in times past in great favour of the Kings they served; as the favourites of Henry III, Edward II, Richard II, Henry VI; which favourites were some imprisoned, some banished, and some put to death by the same rebels that imprisoned, banished, and put to death the same King, upon no better ground than the Earl of Strafford, the Archbishop of Canterbury, and King Charles the First, by the rebels of that time. Empson and Dudley were no favourites of Henry

the seventh, but sponges, which King Henry the eighth did well squeeze. Cardinal Wolsey was indeed for divers years a favourite of Henry the eighth, but fell into disgrace, not for flattering the King, but for not flattering him in the business of divorce from Queen Katherine. You see his reasoning here; see also his passion in the words following: we will for some causes descend no lower: Qui eorum vestigiis insistent, eorum exitus perhorrescant. This is put in for the favourite, that then was, of King James. But let us give over this, and speak of the legal punishments to these crimes belonging.

And in the first place I desire to know who it is that hath the power, for an offence committed, to define and appoint the special manner of punishment. For I suppose you are not of the opinion of the Stoics in old time, that all faults are equal, and that there ought to be the same punishment for killing a man, and for killing a hen.

Of punishments.

L.

The manner of punishment in all crimes whatsoever, is to be determined by the common-law. That is to say, if it be a statute that determines it, then the judgment must be according to the statute; if it be not specified by the statute, then the custom in such cases is to be followed: but if the case be new, I know not why the judge may not determine it according to reason.

P.

But according to whose reason? If you mean the natural reason of this or that judge authorized by the King to have cognizance of the cause, there being as many several reasons, as there are several men, the punishment of all crimes will be uncertain, and none of them ever grow up to make a custom. Therefore a punishment certain can never be assigned, if it have its beginning from the natural reasons of deputed judges; no, nor from the

natural reason of the supreme judge. For if the law of reason did determine punishments, then for the same offences there should be, through all the world and in all times, the same punishments; because the law of reason is immutable and eternal.

L.

If the natural reason neither of the King, nor of any else, be able to prescribe a punishment, how can there be any lawful punishment at all?

P.

Why not? For I think that in this very difference between the rational faculties of particular men, lieth the true and perfect reason that maketh every punishment certain. For, but give the authority of defining punishments to any man whatsoever, and let that man define them, and right reason has defined them, suppose the definition be both made, and made known before the offence committed. For such authority is to trump in card playing, save that in matter of government, when nothing else is turned up, clubs are trumps. Therefore seeing every man knoweth by his own reason what actions are against the law of reason, and knoweth what punishments are by this authority for every evil action ordained; it is manifest reason, that for breaking the known laws he should suffer the known punishments. Now the person to whom this authority of defining punishments is given, can be no other, in any place of the world, but the same person that hath the sovereign power, be it one man or one assembly of men. For it were in vain to give it to any person that had not the power of the militia to cause it to be executed; for no less power can do it, when many offenders be united and combined to defend one another. There was a case put to King David by Nathan, of a rich man that had many sheep, and of a poor man that had but one, which was a tame lamb: the rich man had a stranger in his house, for whose entertainment, to spare his own sheep he took away the poor man's

lamb. Upon this case the King gave judgment, “Surely the man that hath done this shall die.” What think you of this? Was it a royal, or tyrannical judgment?

L.

I will not contradict the canons of the Church of England, which acknowledge the King of England within his own dominions hath the same rights, which the good Kings of Israel had in theirs; nor deny King David to have been one of those good Kings. But to punish with death without a precedent law, will seem but a harsh proceeding with us, who unwillingly hear of arbitrary laws, much less of arbitrary punishments, unless we were sure that all our Kings would be as good as David. I will only ask you, by what authority the clergy may take upon them to determine or make a canon concerning the power of their own King, or to distinguish between the right of a good and an evil King.

P.

It is not the clergy that make their canons to be law, but it is the King that doth it by the great seal of England; and it is the King that giveth them power to teach their doctrines, in that, that he authorized them publicly to teach and preach the doctrine of Christ and his apostles, according to the Scriptures, wherein this doctrine is perspicuously contained. But if they had derogated from the royal power in any of their doctrines published, then certainly they had been to blame; nay, I believe that they had been more within the statute of *præmunire* of 16 Rich. II, c. 5, than any judge of a Court of Equity for holding pleas of common-law. I cite not this precedent of King David, as approving the breach of the great charter, or justifying the punishment with loss of life or member, of every man that shall offend the King; but to show you that before the charter was granted, in all cases where the punishments were not prescribed, it was the King only that could

prescribe them; and that no deputed judge could punish an offender but by force of some statute, or by the words of some commission, and not ex officio. They might for a contempt of their courts, because it is a contempt of the King, imprison a man during the King's pleasure, or fine him to the King according to the greatness of the offence: but all this amounteth to no more, than to leave him to the King's judgment. As for cutting off of ears, and for the pillory, and the like corporal punishments usually inflicted heretofore in the Star-chamber, they were warranted by the statute of Hen. VII, that giveth them power to punish sometimes by discretion. And generally it is a rule of reason, that every judge of crimes, in case the positive law appoint no punishment, and he have no other command from the King, then do consult the King before he pronounce sentence of any irreparable damage on the offender: for otherwise he doth not pronounce the law, which is his office to do, but makes the law, which is the office of the King. And from this you may collect, that the custom of punishing such and such a crime, in such and such a manner, hath not the force of law in itself, but from an assured presumption that the original of the custom was the judgment of some former King. And for this cause the judges ought not to run up, for the customs by which they are warranted, to the time of the Saxon Kings, nor to the time of the Conquest. For the most immediate antecedent precedents are the fairest warrants of their judgments; as the most recent laws have commonly the greatest vigour, as being fresh in the memory of all men, and tacitly confirmed, because not disapproved, by the sovereign legislator. What can be said against this?

L.

Sir Edward Coke, (3 Inst.), in the chapter of judgments and executions, saith, that of judgments some are by the common-law, some by statute-law, and some by custom; wherein he distinguisheth common-law both from statute-law and from custom.

P.

But you know, that in other places he makes the common-law, and the law of reason, to be all one; as indeed they are, when by it is meant the King's reason. And then his meaning in this distinction must be, that there be judgments by reason without statute-law, and judgments neither by statute-law nor by reason, but by custom without reason. For if a custom be reasonable, then, both he and other learned lawyers say, it is common-law; and if unreasonable, no law at all.

L.

I believe Sir Edward Coke's meaning was no other than yours in this point, but that he inserted the word custom, because there be not many that can distinguish between customs reasonable and unreasonable.

P.

But custom, so far forth as it hath the force of a law, hath more of the nature of a statute, than of the law of reason, especially where the question is not of lands and goods, but of punishments, which are to be defined only by authority. Now to come to particulars, what punishment is due by law for high-treason?

L.

To be drawn upon a hurdle from the prison to the gallows, and there to be hanged by the neck, and laid upon the ground alive, and have his bowels taken out and burnt whilst he is yet living; to have his head cut off, his body to be divided into four parts, and his head and quarters to be placed as the King shall assign.

P.

Seeing a judge ought to give judgment according to the law, and that this judgment is not appointed by any statute, how does Sir Edward Coke warrant it by reason, or how by custom?

L.

Only thus: reason it is, that his body, lands, goods, posterity, &c. should be torn, pulled asunder, and destroyed, that intended to destroy the majesty of government.

P.

See how he avoids the saying the majesty of the King. But does not this reason make as much for punishing a traitor, as Mettius Fuffetius in old time was executed by Tullus Hostilius, King of Rome, or as Ravaillac, not many years ago in France, who were torn in pieces by four horses, as it does for drawing, hanging, and quartering?

L.

I think it does. But he confirms it also in the same chapter, by holy Scripture. Thus Joab for treason (1 Kings ii. 28), was drawn from the horns of the altar; that is proof for drawing upon a hurdle: Esth. ii. 22; Bigthan for treason was hanged; there is proof for hanging: Acts i. 18; Judas hanged himself and his bowels were poured out; there is for hanging and embowelling alive: 2 Sam. xviii. 14; Joab pierced Absalom's heart; that is proof for pulling out a traitor's heart: 2 Sam. xx. 22; Sheba the son of Bichri had his head cut off; which is proof that a traitor's head ought to be cut off: 2 Sam. iv. 12; they slew Baanah and Rechab, and hung up their heads over the pool of Hebron; this is for setting up of quarters: and lastly for forfeiture of lands, and goods, Psalms cix. 9-15: Let their children be driven out, and beg, and other men make spoil of their labours, and let their memory be blotted out of the land.

P.

Learnedly said; and no record is to be kept of the judgment. Also the punishments divided between those traitors, must be joined in one judgment for a traitor here.

L.

He meant none of this, but intended (his hand being in) to show his reading, or his chaplain's, in the Bible.

P.

Seeing then for the specifying of the punishment in case of treason, he brings no argument from natural reason, that is to say, from the common-law; and that it is manifest that it is not the general custom of the land, the same being rarely or never executed upon any peer of the realm, and that the King may remit the whole penalty, if he will: it follows, that the specifying of the punishment depends merely upon the authority of the King. But this is certain, that no judge ought to give other judgment, than has been usually given and approved either by a statute, or by consent express or implied of the sovereign power. For otherwise it is not the judgment of the law, but of a man subject to the law.

L.

In petit treason the judgment is, to be drawn to the place of execution, and hanged by the neck; or if it be a woman, to be drawn and burnt.

P.

Can you imagine that this so nice a distinction can have any other foundation than the wit of a private man?

L.

Sir Edward Coke upon this place says, that she ought not to be beheaded or hanged.

P.

No, not by the judge, who ought to give no other judgment than the statute or the King appoints; nor the sheriff to make other execution than the judge pronounceth; unless he have a special warrant from the King. And this I should have thought he had meant, had he not said before, that the King had given away all his right of judicature to his courts of justice.

L.

The judgment for felony is —

P.

Heresy is before felony in the catalogue of the pleas of the Crown.

L.

He has omitted the judgment against a heretic, because, I think, no jury can find heresy, nor no judge temporal did ever pronounce judgment upon it. For the statute of 2 Hen. V, c. 7, was, that the bishop having convicted any man of heresy, should deliver him to the sheriff, and that the sheriff should believe the bishop. The sheriff therefore was bound by the statute of 2 Hen. IV, after he was delivered to him, to burn him; but that statute being repealed, the sheriff could not burn him, without a writ de heretico comburendo, and therefore the sheriff burnt Legat (9 King James) by that writ, which was granted by the judges of the common-law at that time, and in that writ the judgment is expressed.

P.

This is strange reasoning. When Sir Edward Coke knew and confessed, that the statutes upon which the writ de hæretico comburendo was

grounded, were all repealed, how could he think the writ itself could be in force? Or that the statute, which repealeth the statutes for burning heretics, was not made with an intent to forbid such burning? It is manifest he understood not his books of common-law. For in the time of Henry IV and Henry V, the word of the bishop was the sheriff's warrant, and there was need of no such writ; nor could be till the 25 Hen. VIII, when those statutes were repealed, and a writ made for that purpose and put into the register, which writ Fitzherbert cites in the end of his *Natura Brevium*. Again, in the latter end of the reign of Queen Elizabeth, was published a correct register of original and judicial writs, and the writ de hæretico comburendo left out; because that statute of 25 Hen. VIII, and all statutes against heretics, were repealed, and burning forbidden. And whereas he citeth for the granting of this writ, in the ninth year of James I, the Lord Chief Justice, the Lord Chief Baron, and two Justices of the Common-Pleas, it is, as to all but the Lord Chief Justice, against the law. For neither the judges of Common-Pleas, nor of the Exchequer, can hold pleas of the Crown without special commission; and if they cannot hold plea, they cannot condemn.

L.

The punishment for felony is, that the felon be hanged by the neck till he be dead. And to prove that it ought to be so, he cites a sentence, from whence I know not, *Quod non licet felonem pro feloniam decollare*.

P.

It is not indeed lawful for the sheriff of his own head to do it, or to do otherwise than is commanded in the judgment, nor for the judge to give any other judgment than according to statute-law, or the usage consented to by the King; but this hinders not the King from altering his law concerning judgments, if he see good cause.

L.

The King may do so, if he please: and Sir Edward Coke tells you how he altered particular judgments in case of felony, and showeth that judgment being given upon a lord in Parliament, that he should be hanged, he was nevertheless beheaded; and that another lord had the like judgment for another felony, and was not hanged but beheaded: and withal he shows you the inconveniency of such proceeding, because, saith he, if hanging might be altered to beheading, by the same reason it might be altered to burning, stoning to death, &c.

P.

Perhaps there might be inconveniency in it; but it is more than I see, or he shows, nor did there happen any inconveniency from the execution he citeth: besides he granteth, that death, being ultimum supplicium, is a satisfaction to the law. But what is all this to the purpose, when it belongeth not to consider such inconveniences of government but to the King and Parliament? Or who, from the authority of a deputed judge, can derive a power to censure the actions of a King that hath deputed him?

L.

For the death of a man by misfortune, there is, he saith, no express judgment, nor for killing a man in one's own defence; but he saith, that the law hath in both cases given judgment that he, that so killeth a man, shall forfeit all his goods and chattels, debts and duties.

P.

If we consider what Sir Edward Coke saith (1 Inst. sec. 745), at the word felony, these judgments are very favourable; for there he saith, that killing a man by chance medley, or se defendendo, is felony. His words are: "wherefore by the law at this day, under the word felony in commissions, &c. is included petite treason, murder, homicide, burning of houses,

burglary, robbery, rape, &c. chance-medley, and se defendendo.” But if we consider only the intent of him that killeth a man by misfortune or in his own defence, the same judgments will be thought both cruel and sinful judgments. And how they can be felony, at this day cannot be understood, unless there be a statute to make them so. For the statute of 25 Hen. III, c. 25, the words whereof, “murder from henceforth shall not be judged before our justices, where it is found misfortune only, but it shall take place in such as are slain by felony, and not otherwise,” make it manifest, if they be felonies, they must also be murders, unless they have been made felonies by some later statute.

L.

There is no such later statute, nor is it to say in commission; nor can a commission, or anything but another statute, make a thing felony that was not so before.

P.

See what it is for a man to distinguish felony into several sorts, before he understands the general name of felony, what it meaneth. But that a man, for killing another man by misfortune only, without any evil purpose, should forfeit all his goods and chattels, debts and duties, is a very hard judgment, unless perhaps they were to be given to the kindred of the man slain, by way of amends for damage. But the law is not that. Is it the common-law, which is the law of reason, that justifies this judgment, or the statute-law? It cannot be called the law of reason, if the case be mere misfortune. If a man be upon his appletree to gather his apples, and by ill-fortune fall down, and lighting on the head of another man, kill him, and by good fortune save himself; shall he for this mischance be punished with the forfeiture of his goods to the King? Does the law of reason warrant this? He should, you will say, have looked to his feet; that is true; but so should he,

that was under, have looked up to the tree. Therefore in this case the law of reason, as I think, dictates that they ought each of them to bear his own misfortune.

L.

In this case I agree with you.

P.

But this case is the true case of mere misfortune, and a sufficient reprehension of the opinion of Sir Edward Coke.

L.

But what if this had happened to be done by one, that had been stealing apples upon the tree of another man? Then, as Sir Edward Coke says (3 Inst.), it had been murder.

P.

There is indeed great need of good distinction in a case of killing by misfortune. But in this case the unlawfulness of stealing apples cannot make it murder, unless the falling itself be unlawful. It must be a voluntary unlawful act that causeth the death, or else it is no murder by the law of reason. Now the death of the man that was under the tree, proceeded not from that, that the apples were not his that fell, but from the fall. But if a man shoot with a bow or a gun at another man's deer, and by misfortune kill a man, such shooting being both voluntary and unlawful, and also the immediate cause of the man's death, may be drawn, perhaps well enough sometimes, to murder by a judge of the common-law. So likewise if a man shoot an arrow over a house, and by chance kill a man in the street, there is no doubt but by the law of reason it is murder: for though he meant no malice to the man slain, yet it is manifest that he cared not whom he slew.

In this difficulty of finding out what it is that the law of reason dictates, who is it that must decide the question?

L.

In the case of misfortune, I think it belongs to the jury; for it is matter of fact only. But when it is doubtful whether the action from which the misfortune came, were lawful or unlawful, it is to be judged by the judge.

P.

But if the unlawfulness of the action, as the stealing of the apples, did not cause the death of the man; then the stealing, be it trespass or felony, ought to be punished alone, as the law requireth.

L.

But for the killing of a man *se defendendo*, the jury, as Sir Edward Coke here says, shall not in their verdict say it was *se defendendo*, but shall declare the manner of the fact in special, and clear it to the judge to consider how it is to be called, whether *se defendendo*, manslaughter, or murder.

P.

One would think so; for it is not often within the capacity of a jury, to distinguish the signification of the different hard names which are given by lawyers to the killing of a man: as murder and felony, which neither the laws, nor the makers of the laws, have yet defined. The witnesses say, that thus and thus the person did, but not that it was murder or felony; no more can the jury say, who ought to say nothing but what they hear from the witnesses or from the prisoner. Nor ought the judge to ground his sentence upon anything else besides the special matter found, which, according as it is contrary or not contrary to the statute, ought to be pronounced.

L.

But I have told you, that when the jury has found misfortune or se defendendo, there is no judgment at all to be given, and the party is to be pardoned of course, saving that he shall forfeit his goods and chattels, debts and duties, to the King.

P.

But I understand not how there can be a crime for which there is no judgment, nor how any punishment can be inflicted without a precedent judgment, nor upon what ground the sheriff can seize the goods of any man, till it be judged that they be forfeited. I know that Sir Edward Coke saith, that in the judgment of hanging, the judgment of forfeiture is implied, which I understand not; though I understand well enough, that the sheriff by his office may seize the goods of a felon convicted; much less do I conceive how the forfeiture of goods can be implied in a no-judgment; nor do I conceive, that when the jury has found the special manner of the fact to be such as is really no other than se defendendo, and consequently no fault at all, why he should have any punishment at all. Can you show me any reason for it?

L.

The reason lies in the custom.

P.

You know that unreasonable customs are not law, but ought to be abolished; and what custom is there more unreasonable, than that a man should be punished without a fault?

L.

Then see the statute of 24 Hen. VIII, c. 5.

P.

I find here, that at the making of this statute there was a question amongst the lawyers, in case one man should kill another, that attempted feloniously to rob or murder him in or near any common highway, courtway, horseway, or footway, or in his mansion, messuage, or dwelling place; whether for the death of such a man one shall forfeit his goods and chattels, as a man should do for killing another by chance medley or in his own defence. This is the preamble, and penned as well as Sir Edward Coke could have wished. But this statute does not determine that a man should forfeit his goods for killing a man *se defendendo*, or for killing him by misfortune; but supposeth it only upon the opinion of the lawyers that then were. The body of the statute is, that if a man be indicted or appealed for the death of such person so attempting as aforesaid, and the same by verdict be so found and tried, he shall not forfeit anything, but shall be discharged as if he had been found not guilty. You see the statute; now consider thereby, in the case of killing *se defendendo*. First, if a man kill another in his own defence, it is manifest that the man slain did either attempt to rob, or to kill, or to wound him; for else it were not done in his own defence. If then it were done in the street, or near the street, as in a tavern, he forfeits nothing, because the street is a highway. So likewise it is to be said of all other common-ways. In what place therefore can a man kill another in his own defence, but that this statute will discharge him of the forfeiture?

L.

But the statute says the attempt must be felonious.

P.

When a man assaults me with a knife, sword, club, or other mortal weapon, does any law forbid me to defend myself, or command me to stay so long as to know whether he have a felonious intent, or no? Therefore by this statute, in case it be found *se defendendo*, the forfeiture is discharged; if

it be found otherwise, it is capital. If we read the statute of Glocester, ca, I think it will take away the difficulty. For by that statute, in case it be found by the country that he did it in his own defence or by misfortune, then by the report of the justices to the King, the King shall take him to his grace, if it please him. From whence it followeth, first, that it was then thought law, that the jury may give the general verdict of se defendendo; which Sir Edward Coke denies. Secondly, that the judge ought to report especial matter to the King. Thirdly, that the King may take him to his grace, if he please; and consequently, that his goods are not to be seized, till the King, after the report of the judge heard, give the sheriff command to do it. Fourthly, that the general verdict of the King hinders not the King but that he may judge of it upon the special matter; for it often happens that an ill-disposed person provokes a man with words or otherwise, on purpose to make him draw his sword, that he may kill him, and pretend it done in his own defence; which appearing, the King may, without any offence to God, punish him, as the cause shall require. Lastly, contrary to the doctrine of Sir Edward Coke, he may in his own person be judge in the case, and annul the verdict of the jury; which a deputed judge cannot do.

L.

There be some cases wherein a man, though by the jury he be found not guilty, shall nevertheless forfeit his goods and chattels to the King. For example; a man is slain, and one A, hating B, giveth out that it was B that slew him; B hearing thereof, fearing if he be tried for it, that through the great power of A, and others that seek his hurt, he should be condemned, flieth, and afterwards is taken and tried; and upon sufficient evidence is by the jury found not guilty; yet because he fled, he shall forfeit his goods and chattels, notwithstanding there be no such judgment given by the judge, nor appointed by any statute; but the law itself authoriseth the sheriff to seize them to the use of the King.

P.

I see no reason (which is common-law) for it, and am sure it is grounded upon no statute.

L.

See Sir Edward Coke, 1 Inst. s. 709, and read.

P.

“If a man that is innocent be accused of felony, and for fear flieth for the same; albeit that he be judicially acquitted of the felony, yet if it be found that he fled for the same, he shall, notwithstanding his innocence, forfeit all his goods and chattels, debts and duties.” O unchristian and abominable doctrine! which also he in his own words following contradicteth: “for,” saith he, “as to the forfeiture of them, the law will admit no proof against the presumption of the law grounded upon his flight, and so it is in many other cases: but that the general rule is, *Quod stabitur præsumptioni, donec probetur in contrarium*; but you see it hath many exceptions.” This general rule contradicts what he said before; for there can be no exceptions to a general rule in law, that is not expressly made an exception by some statute, and to a general rule of equity there can be no exception at all.

From the power of punishing, let us proceed to the power of pardoning.

Of pardoning.

L.

Touching the power of pardoning, Sir Edward Coke says, (3 Inst.), that no man shall obtain charter of pardon out of Parliament; and cites for it the statute of 2 Edw. III, c. 2; and says further, that accordingly in a Parliament roll it is said, that for the peace of the land it would help that no pardon were granted but by Parliament.

P.

What lawful power would he have left to the King, that thus disableth him to practise mercy? In the statute which he citeth, to prove that the King ought not to grant charters of pardon but in Parliament, there are no such words, as any man may see; for that statute is in print; and that which he says is in the Parliament roll, is but a wish of he tells not whom, and not a law; and it is strange that a private wish should be enrolled among acts of Parliament. If a man do you an injury, to whom, think you, belongeth the right of pardoning it?

L.

Doubtless to me alone, if to me alone be done that injury; and to the King alone, if to him alone be done the injury; and to both together, if the injury be done to both.

P.

What part then has any man in the granting of a pardon, but the King and the party wronged. If you offend no member of either House, why should you ask their pardon? It is possible that a man may deserve a pardon; or he may be such a one sometimes as the defence of the kingdom hath need of. May not the King pardon him, though there be no Parliament then sitting? Sir Edward Coke's law is too general in this point; and I believe, if he had thought on it, he would have excepted some persons, if not all the King's children and his heir apparent; and yet they are all his subjects, and subject to the law as other men.

L.

But if the King shall grant pardons of murder and felony of his own head, there would be very little safety for any man, either out of his house or in it, either by night or by day. And for that very cause there have been

many good statutes provided, which forbid the justices to allow of such pardons as do not specially name the crime.

P.

Those statutes, I confess, are reasonable, and very profitable, which forbid the judge to pardon murders. But what statute is there that forbids the King to do it? There is a statute of 13 Rich. II, c. 1, wherein the King promiseth not to pardon murder; but there is in it a clause for the saving of the King's regality. From which may be inferred that the King did not grant away that power, when he thought good to use it for the commonwealth. Such statutes are not laws to the King, but to his judges, and though the judges be commanded by the King not to allow pardons in many cases, yet if the King by writing command the judges to allow them, they ought to do it. I think, if the King think in his conscience it be for the good of the commonwealth, he sinneth not in it: but I hold not that the King may pardon him without sin, if any other man be damnified by the crime committed, unless he cause reparation to be made as far as the party offending can do it. And howsoever, be it sin or not sin, there is no power in England that may resist him or speak evil of him lawfully.

L.

Sir Edward Coke denies not that; and upon that ground it is that the King, he says, may pardon high-treason; for there can be no high-treason but against the King.

P.

That is well; therefore he confesseth, that whatsoever the offence be, the King may pardon so much of it as is an injury to himself, and that by his own right, without breach of any law positive or natural, or of any grant, if his conscience tell him that it be not to the damage of the commonwealth;

and you know that to judge of what is good or evil to the commonwealth, belongeth to the King only. Now tell me, what it is which is said to be pardoned?

L.

What can it be, but only the offence? If a man hath done a murder, and be pardoned for the same, is it not the murder that is pardoned?

P.

Nay, by your favour, if a man be pardoned for murder or any other offence, it is the man that is pardoned; the murder still remains murder. But what is pardon?

L.

Pardon, as Sir Edward Coke says, (3 Inst.), is derived of per and dono, and signifies thoroughly to remit.

P.

If the King remit the murder, and pardon not the man that did it, what does the remission serve for?

L.

You know well enough that when we say a murder, or any thing else, is pardoned, all Englishmen understand thereby, that the punishment due to the offence is the thing remitted.

P.

But for our understanding of one another, you ought to have said so at first. I understand now, that to pardon murder or felony is thoroughly to save the offender from all the punishment due unto him by the law for his offence.

L.

Not so; for Sir Edward Coke in the same chapter, , saith thus: “a man commits felony, and is attainted thereof, or is abjured; the King pardoneth the felony without any mention of the attainder or abjuration: the pardon is void.”

P.

What is it to be attainted?

L.

To be attainted is, that his blood be held in law as stained and corrupted; so that no inheritance can descend from him to his children, or to any that make claim by him.

P.

Is this attainder a part of the crime or of the punishment?

L.

It cannot be a part of the crime, because it is none of his own act; it is therefore a part of the punishment, viz. a disherison of the offender.

P.

If it be a part of the punishment due, and yet not pardoned together with the rest, then a pardon is not a thorough remitting of the punishment, as Sir Edward Coke says it is. And what is abjuration?

L.

When a clerk heretofore was convicted of felony, he might have saved his life by abjuring the realm; that is, by departing the realm within a certain time appointed, and taking an oath never to return. But at this day all statutes for abjuration are repealed.

P.

That also is a punishment, and by a pardon of the felony pardoned, unless a statute be in force to the contrary. There is also somewhat in the statute of 13 Rich. II, c. 1, concerning the allowance of characters of pardons, which I understand not well. The words are these: “No charter of pardon for henceforth shall be allowed before our justices for murder, or for the death of a man by await, or malice prepensed, treason, or rape of a woman, unless the same be specified in the same charter.” For I think it follows thence, that if the King say in his charter that he pardoneth the murder, then he breaketh not the statute, because he specifies the offence: or if he saith he pardoneth the killing by await or of malice prepensed, he breaketh not the statute, he specifies the offence. Also if he say so much as that the judge cannot doubt of the King’s meaning to pardon him, I think the judge ought to allow it, because the statute saveth the King’s liberty and regality in that point; that is to say, the power to pardon him, such as are these words, “notwithstanding any statute to the contrary,” are sufficient to cause the charter to be allowed; for these words make it manifest that the charter was not granted upon surprise, but to maintain and claim the King’s liberty and power to show mercy when he seeth cause. The like meaning have these words, *perdonavimus omnimodam interfectionem*; that is to say, we have pardoned the killing, in what manner soever it was done. But here we must remember that the King cannot pardon, without sin, any damage thereby done to another man, unless he causes satisfaction to be made as far as the offender possibly can; but he is not bound to satisfy men’s thirst of revenge; for all revenge ought to proceed from God, and under God from the King. Now, besides in charters, how are these offences specified?

L.

They are specified by their names, as treason, petite treason, murder, rape, felony, and the like.

P.

Petite treason is felony, murder is felony; so is rape, robbery, and theft; and, as Sir Edward Coke says, petite larceny is felony. Now if in a Parliament-pardon, or in a Coronation-pardon, all felonies be pardoned, whether is petite larceny pardoned, or not?

L.

Yes, certainly, it is pardoned.

P.

And yet you see it is not specified; and yet it is a crime that hath less in it of the nature of felony, than there is in robbery. Do not therefore rape, robbery, theft, pass under the pardon of all felonies?

L.

I think they are all pardoned by the words of the statute, but those that are by the same statute excepted; so that specification is needful only in charters of pardon, but in general pardons not so. For the statute 13 Rich. II, c. 1, forbids not the allowance of Parliament-pardons, or Coronation-pardons; and therefore the offences pardoned need not be specified, but may pass under the general word of all felonies. Nor is it likely that the members of the Parliament, who drew up their own pardons, did not mean to make them as comprehensive as they could. And yet Sir Edward Coke (1 Inst. sec. 745), at the word felony, seemeth to be of another mind. For piracy is one species of felony; and yet when certain Englishmen had committed piracy in the last year of Queen Elizabeth, and came home into England in the beginning of the reign of King James, trusting to his coronation-pardon of all felonies, they were indicted (Sir Edward Coke was then Attorney-

general) of the piracy before commissioners, according to the statute of 28 Hen. VIII, and being found guilty were hanged. The reason he allegeth for it is, that it ought to have been specified by the name of piracy in the pardon, and therefore the pardon was not to be allowed.

P.

Why ought it to have been specified more than any other felony? He should therefore have drawn his argument from the law of reason.

L.

Also he does that; for the trial, he says, was by the common-law, and before commissioners, not in the Court of the Lord Admiral, by the civil law; therefore, he says, it was an offence whereof the common-law could not take any notice, because it could not be tried by twelve men.

P.

If the common-law could not, or ought not, to take notice of such offences, how could the offenders be tried by twelve men, and found guilty, and hanged as they were? If the common-law take no notice of piracy, what other offence was it for which they were hanged? Is piracy two felonies, for one of which a man shall be hanged by the civil-law, and for the other by the common-law? Truly I never read weaker reasoning in any author of the law of England, than in Sir Edward Coke's Institutes, how well soever he could plead.

L.

Though I have heard him much reprehended by others as well as by you, yet there be many excellent things, both for subtilty and for truth, in these his Institutes.

P.

No better things than other lawyers have, that write of the law as of a science. His citing of Aristotle, and of Homer, and of other books which are commonly read by gownmen, do, in my opinion, but weaken his authority; for any man may do it by a servant. But seeing the whole scene of that time is gone and past, let us proceed to somewhat else. Wherein doth an Act of Oblivion differ from a Parliament-pardon?

L.

This word Act of Oblivion was never in our law-books before the 12 Car. II. c. 11, and I wish it may never come again; but from whence it came, you may better know perhaps than I.

P.

The first and only Act of Oblivion that ever passed into a law, in any state that I have read of, was that amnestia or oblivion of all quarrels between any of the citizens of Athens, at any time before that act, without all exception of crime or person. The occasion whereof was this. The Lacedæmonians having totally subdued the Athenians, entered into the city of Athens, and ordained that the people should choose thirty people of their own city to have the sovereign power over them. These being chosen, behaved themselves so outrageously, as caused a sedition, in which the citizens on both sides were daily slain. There was then a discreet person that propounded to each of the parties this proposition, that every man should return to his own and forget all that was past; which proposition was made, by consent on both sides, into a public act, which for that cause was called an oblivion. Upon the like disorder happening in Rome by the murder of Julius Cæsar, the like act was propounded by Cicero, and indeed passed, but was within a few days after broken again by Marcus Antonius. In imitation of this act was made the act of 12 Car. II. c. 11.

L.

By this it seems, that the Act of Oblivion made by King Charles was no other than a Parliament-pardon, because it containeth a great number of exceptions, as the other Parliament-pardons do, and the act of Athens did not.

P.

But yet there is a difference between the late Act of Oblivion made here, and an ordinary Parliament-pardon. For concerning a fault pardoned in Parliament by a general word, a suit in law may arise about this, whether the offender be signified by the word or not, as whether the pardon of all felonies be a pardon of piracy or not. For you see by Sir Edward Coke's reports, that notwithstanding a pardon of felony, a sea-felony, when he was Attorney-General, was not pardoned. But by the late Act of Oblivion, which pardoned all manner of offences committed in the late civil war, no question could arise concerning crimes excepted. First, because no man can by law accuse another man of a fact, which by law is to be forgotten. Secondly, because all crimes may be alleged as proceeding from the licentiousness of the time, and from the silence of the law occasioned by the civil war, and consequently (unless the offender's person also were excepted, or unless the crime were committed before the war began) are within the pardon.

L.

Truly I think you say right. For if nothing had been pardoned but what was done by the occasion of the war, the raising of the war itself had not been pardoned.

P.

I have done with crimes and punishments; let us come now to the laws of meum and tuum.

Of the laws of meum and tuum.

L.

We must then examine the statutes.

P.

We must so, what they command and forbid; but not dispute of their justice. For the law of reason commands that every one observe the law which he hath assented to, and obey the person to whom he hath promised obedience and fidelity. Then let us consider next the commentaries of Sir Edward Coke upon Magna Charta and other statutes. For the understanding of Magna Charta it will be very necessary to run up into ancient times, as far as history will give us leave, and consider not only the customs of our ancestors the Saxons, but also the law of nature, the most ancient of all laws, concerning the original of government and acquisition of property, and concerning courts of judicature. And first, it is evident that dominion, government, and laws, are far more ancient than history or any other writing, and that the beginning of all dominion amongst men was in families. In which, first, the father of the family by the law of nature was absolute lord of his wife and children: secondly, made what laws amongst them he pleased: thirdly, was judge of all their controversies: fourthly, was not obliged by any law of man to follow any counsel but his own: fifthly, what land soever the lord sat down upon and made use of for his own and his family's benefit, was his propriety by the law of first possession, in case it was void of inhabitants before, or by the law of war, in case they conquered it. In this conquest what enemies they took and saved, were their servants. Also such men as wanting possessions of lands, but furnished with arts necessary for man's life, came to dwell in the family for protection, became their subjects, and submitted themselves to the laws of the family. And all this is consonant, not only to the law of nature, but also to the practice of mankind set forth in history, sacred and profane.

L.

Do you think it lawful for a lord, that is the sovereign ruler of his family, to make war upon another like sovereign lord, and dispossess him of his lands?

P.

It is lawful or not lawful, according to the intention of him that does it. For, first, being a sovereign ruler, he is not subject to any law of man; and as to the law of God, where the intention is justifiable, the action is so also. The intention may be lawful in divers cases by the right of nature; one of those cases is, when he is constrained to it by the necessity of subsisting. So the children of Israel, besides that their leaders, Moses and Joshua, had an immediate command from God to dispossess the Canaanites, had also a just pretence to do what they did, from the right of nature which they had to preserve their lives, being unable otherwise to subsist. And as their preservation, so also is their security a just pretence of invading those whom they have just cause to fear, unless sufficient caution be given to take away their fear: which caution, for anything I can yet conceive, is utterly impossible. Necessity and security are the principal justifications before God, of beginning war. Injuries received justify a war defensive; but for reparable injuries, if reparation be tendered, all invasion upon that title is iniquity. If you need examples, either from Scripture or other history, concerning this right of nature in making war, you are able enough of your own reading to find them out at your leisure.

L.

Whereas you say, that the lands so won by the sovereign lord of a family, are his in propriety, you deny, methinks, all property to the subjects, how much soever any of them have contributed to the victory.

P.

I do so; nor do I see any reason to the contrary. For the subjects, when they come into the family, have no title at all to demand any part of the land, or anything else but security: to which also they are bound to contribute their whole strength, and, if need be, their whole fortunes. For it cannot be supposed that any one man can protect all the rest with his own single strength; and for the practice, it is manifest, in all conquests the land of the vanquished is in the sole power of the victor, and at his disposal. Did not Joshua and the High-priest divide the land of Canaan in such sort among the tribes of Israel as they pleased? Did not the Roman and Grecian princes and states, according to their own discretion, send out the colonies to inhabit such provinces as they had conquered? Is there at this day among the Turks, any inheritor of land besides the Sultan? And was not all the land in England once in the hands of William the Conqueror? Sir Edward Coke himself confesses it. Therefore it is an universal truth, that all conquered lands, presently after victory, are the lands of him that conquered them.

L.

But you know that all sovereigns are said to have a double capacity, viz. a natural capacity, as he is a man; and a politic capacity, as a king. In his politic capacity, I grant you, that King William the Conqueror was the proper and only owner once of all the land in England; but not in his natural capacity.

P.

If he had them in his politic capacity, then they were so his own, as not to dispose of any part thereof but only to the benefit of his people; and that must be either by his own, or by the people's discretion, that is, by Act of Parliament. But where do you find that the Conqueror disposed of his lands (as he did some to Englishmen, some to Frenchmen, and some to Normans,

to be holden by divers tenures, as knight-service, soccage, &c.) by Act of Parliament? Or that he ever called a Parliament, to have the assent of the Lords and Commons of England in disposing of those lands he had taken from them? Or for retaining of such and such lands in his own hands, by the name of forrests, for his own recreation or magnificence? You have heard perhaps that some lawyers, or other men reputed wise and good patriots, have given out that all the lands which the Kings of England have possessed, have been given them by the people, to the end that they should therewith defray the charges of their wars, and pay the wages of their ministers; and that those lands were gained by the people's money. For that was pretended in the late civil war, when they took from the King his town of Kingston-upon-Hull. But I know you do not think that the pretence was just. It cannot therefore be denied but that the lands, which King William the Conqueror gave away to Englishmen and others, and which they now hold by his letters-patent and other conveyances, were properly and really his own, or else the titles of them that now hold them, must be invalid.

L.

I assent. As you have showed me the beginning of monarchies, so let me hear your opinion concerning their growth.

P.

Great monarchies have proceeded from small families. First, by war, wherein the victor not only enlarged his territory, but also the number and riches of his subjects. As for the other forms of commonwealths, they have been enlarged other ways. First, by a voluntary conjunction of many lords of families into one great aristocracy. Secondly, from rebellion proceeded first anarchy, and from anarchy proceeded any form that the calamities of them that lived therein did prompt them to; whether it were, that they chose an hereditary King, or an elective King for life; or that they agreed upon a

council of certain persons, which is aristocracy; or a council of the whole people to have the sovereign power, which is democracy. After the first manner, which is by war, grew up all the greatest kingdoms in the world, viz. the Egyptian, Assyrian, Persian, and the Macedonian monarchy; and so did the great kingdoms of England, France, and Spain. The second manner, was the original of the Venetian Aristocracy. By the the third way, which is rebellion, grew up divers great monarchies, perpetually changing from one form to another: as in Rome, rebellion against Kings produced democracy, upon which the senate usurped under Sylla, and the people again upon the senate under Marius, and the Emperor usurped upon the people under Cæsar and his successors.

L.

Do you think the distinction between natural and politic capacity is insignificant?

P.

No. If the sovereign power be in an assembly of men, that assembly, whether it be aristocratical or democratical, may possess lands; but it is in their politic capacity: because no natural man has any right to those lands, or any part of them. In the same manner, they can command an act by plurality of commands; but the command of any one of them is of no effect. But when the sovereign power is in one man, the natural and politic capacity are in the same person, and as to possession of lands, undistinguishable. But as to the acts and commands, they may be well distinguished in this manner. Whatsoever a monarch does command or do, by consent of the people of his kingdom, may properly be said to be done in his politic capacity; and whatsoever he commands by word of mouth only, or by letters signed with his hand, or sealed with any of his private seals, is done in his natural capacity. Nevertheless, his public commands, though

they be made in his politic capacity, have their original from his natural capacity. For in the making of laws, which necessarily requires his assent, his assent is natural. Also those acts which are done by the King previously to the passing of them under the Great Seal of England, either by word of mouth, or warrant under his signet or private seal, are done in his natural capacity; but when they have passed the Seal of England, they are to be taken as done in his politic capacity.

L.

I think verily your distinction is good. For natural capacity and politic capacity signify no more than private and public right. Therefore, leaving this argument, let us consider in the next place, as far as history will permit, what were the laws and customs of our ancestors.

P.

The Saxons, as also all the rest of Germany not conquered by the Roman Emperors nor compelled to use the imperial laws, were a savage and heathen people, living only by war and rapine, and as some men learned in the Roman antiquities affirm, had their name of Germans from that their ancient trade of life, as if Germans and *hommes de guerre* were all one. Their rule over their family, servants, and subjects, was absolute; their laws, no other than natural equity; written law they had little or none; and very few there were in the time of the Cæsars that could write or read. The right to the government was either paternal, or by conquest, or by marriages. Their succession to lands was determined by the pleasure of the master of the family, by gift or deed in his lifetime; and what land they disposed not of in their lifetime, descended after their death to their heirs. The heir was the eldest son. The issue of the eldest son failing, they descended to the younger sons in their order; and, for want of sons, to the daughters jointly as to one heir, or to be divided amongst them, and so to descend to their heirs

in the same manner. And children failing, the uncle by the father's or mother's side, according as the lands had been the father's or the mother's, succeeded to the inheritance, and so continually to the next of blood. And this was a natural descent, because naturally the nearer in blood the nearer in kindness, and was held for the law of nature, not only amongst the Germans, but also in most nations before they had a written law. The right of government, which is called *jus regni*, descended in the same manner, except only that after the sons it came to the eldest daughter first, and her heirs; the reason whereof was, that government is indivisible. And this law continues still in England.

L.

Seeing all the land, which any sovereign lord possessed, was his own in propriety, how came a subject to have a propriety in their lands?

P.

There be two sorts of propriety. One is, when a man holds his land from the gift of God only, which lands civilians call allodial; which in a kingdom, no man can have but the King. The other is, when a man holds his land from another man, as given him in respect of service and obedience to that man, as a fee. The first kind of propriety is absolute; the other is in a manner conditional, because given for some service to be done unto the giver. The first kind of propriety excludes the right of all others; the second excludes the right of all other subjects to the same land, but not the right of the sovereign, when the common good of the people shall require the use thereof.

L.

When those kings had thus parted with their lands, what was left them for the maintenance of their wars, either offensive or defensive; or for the

maintenance of the royal family in such manner as not only becomes the dignity of a sovereign king, but is also necessary to keep his person and people from contempt?

P.

They have means enough; and besides what they gave their subjects, had much land remaining in their own hands, afforrested for their recreation. For you know very well that a great part of the land of England was given for military service to the great men of the realm, who were for the most part of the King's kindred or great favourites; much more land than they had need of for their own maintenance; but so charged with one or many soldiers, according to the quantity of land given, as there could be no want of soldiers at all times ready to resist an invading enemy: which soldiers those lords were bound to furnish, for a time certain, at their own charges. You know also, that the whole land was divided into hundreds, and those again into decennaries; in which decennaries all men, even to children of twelve years of age, were bound to take the oath of allegiance. And you are to believe, that those men that hold their land by the service of husbandry, were all bound with their bodies and fortunes to defend the kingdom against invaders, by the law of nature. And so also such as they called villains, and as held their land by baser drudgery, were obliged to defend the kingdom to the utmost of their power. Nay, women and children, in such a necessity, are bound to do such service as they can, that is to say, to bring weapons and victuals to them that fight, and to dig. But those that hold their land by service military, have lying upon them a greater obligation. For read and observe the form of doing homage, according as it is set down in the statute of 17 Edw. II, which you doubt not was in use before that time, and before the Conquest.

L.

I become your man for life, for member, and for worldly honour, and shall owe you my faith for the lands that I hold of you.

P.

I pray you expound it.

L.

I think it is as much as if you should say, I promise you to be at your command, to perform with the hazard of my life, limbs, and all my fortune, as I have charged myself in the reception of the lands you have given me, and to be ever faithful to you. This is the form of homage done to the King immediately. But when one subject holdeth land of another by the like military service, then there is an exception added, viz. saving the faith I owe to the King.

P.

Did he not also take an oath?

L.

Yes, which is called the oath of fealty: I shall be to you both faithful, and lawfully shall do such customs and services, as my duty is to you at the terms assigned, so help me God and all his Saints. But both these services, and the services of husbandry, were quickly after turned into rents, payable either in money, as in England, or in corn or other victuals, as in Scotland and France. When the service was military, the tenant was for the most part bound to serve the King in his wars, with one or more persons, according to the yearly value of the land he held.

P.

Were they bound to find horsemen, or footmen?

L.

I do not find any law that requires any man, in respect of his tenancy, to serve on horseback.

P.

Was the tenant bound, in case he were called, to serve in person?

L.

I think he was so in the beginning. For when lands were given for service military, and the tenant dying left his son and heir, the lord had the custody both of body and lands till the heir was twenty-one years old. And the reason thereof was, that the heir, till that age of twenty-one years, was presumed to be unable to serve the King in his wars; which reason had been insufficient, if the heir had not been bound to go to the wars in person. Which, methinks, should ever hold for law, unless by some other law it come to be altered. These services, together with other rights, as wardships, first possession of his tenants' inheritance, licenses for alienation, felons' goods, felons' lands (if they were holden of the King), and the first year's profit of the lands, of whomsoever they were holden, forfeitures, amercements, and many other aids, could not but amount to a very great yearly revenue. Add to this all that which the King might reasonably have imposed upon artificers and tradesmen; for all men, whom the King protecteth, ought to contribute towards their own protection; and consider then whether the Kings of those times had not means enough, and to spare (if God were not their enemy), to defend their people against foreign enemies, and also to compel them to keep the peace amongst themselves.

P.

And so had had the succeeding Kings, if they had never given their rights away, and their subjects always kept their oaths and promises. In

what manner proceeded those ancient Saxons, and other nations of Germany, especially the northern parts, to the making of their laws?

L.

Sir Edward Coke, out of divers Saxon laws, gathered and published in Saxon and Latin by Mr. Lambard, inferreth that the Saxon Kings, for the making of their laws, called together the Lords and Commons, in such manner as is used at this day in England. But by those laws of the Saxons published by Mr. Lambard, it appeareth, that the Kings called together the bishops, and a great part of the wisest and discreetest men of the realm, and made laws by their advice.

P.

I think so. For there is no King in the world, being of ripe years and sound mind, that made any law otherwise. For it concerns them in their own interest to make such laws as the people can endure, and may keep them without impatience, and live in strength and courage to defend their King and country, against their potent neighbours. But how was it discerned, and by whom was it determined, who were those wisest and discreetest men? It is a hard matter to know who is wisest in our times. We know well enough who chooseth a knight of the shire, and what towns are to send burgesses to the Parliament. Therefore if it were determined also in those days, who those wise men should be, then I confess that the Parliaments of the old Saxons, and the Parliaments of England since, are the same thing, and Sir Edward Coke is in the right. Tell me therefore, if you can, when those towns, which now send burgesses to the Parliament, began to do so, and upon what cause one town had this privilege, and another town, though much more populous, had not.

L.

At what time began this custom I cannot tell; but I am sure it is more ancient than the city of Salisbury. Because there come two burgesses to Parliament for a place near to it, called Old Sarum, which, as I rid in sight of it, if I should tell a stranger that knew not what the word burgess meant, he would think it were a couple of rabbits; the place looketh so like a long cony-borough. And yet a good argument may be drawn from thence, that the townsmen of every town were the electors of their own burgesses, and judges of their discretion; and that the law, whether they be discreet or not, will suppose them to be discreet, till the contrary be apparent. Therefore where it is said, that the King called together the more discreet men of his realm; it must be understood of such elections as are now in use. By which it is manifest, that those great and general moots assembled by the old Saxon Kings, were of the same nature with the Parliaments assembled since the Conquest.

P.

I think your reason is good. For I cannot conceive, how the King, or any other but the inhabitants of the boroughs themselves, can take notice of the discretion or sufficiency of those they were to send to the Parliament. And for the antiquity of the burgess-towns, since it is not mentioned in any history or certain record now extant, it is free for any man to propound his conjecture. You know that this land was invaded by the Saxons at several times, and conquered by pieces in several wars; so that there were in England many Kings at once, and every of them had his Parliament. And therefore according as there were more, or fewer walled towns within each King's dominion, his Parliament had the more or fewer burgesses. But when all these lesser kingdoms were joined into one, then to that one Parliament came burgesses from all the boroughs of England. And this perhaps may be the reason, why there be so many more such boroughs in the west, than in any other part of the kingdom; the west being more populous, and also more

obnoxious to invaders, and for that cause having greater store of towns fortified. This I think may be the original of that privilege which some towns have, to send burgesses to the Parliament, and others have not.

L.

The conjecture is not improbable, and for want of greater certainty, may be allowed. But seeing it is commonly received, that for the making of a law, there ought to be had the assent of the Lords spiritual and temporal; whom do you account in the Parliaments of the old Saxons for Lords temporal, and whom for Lords spiritual? For the book called *The mode of holding Parliaments*, agreeth punctually with the manner of holding them at this day, and was written, as Sir Edward Coke says, in the time of the Saxons, and before the Conquest.

P.

Mr. Selden, a greater antiquary than Sir Edward Coke, in the last edition of his book of *Titles of Honour*, says, that that book called *The mode of holding Parliaments*, was not written till about the time of Richard II, and seems to me to prove it. But howsoever that be, it is apparent by the Saxon laws set forth by Mr. Lambard, that there were always called to the Parliament certain great persons called Aldermen, alias Earls. And so you have a House of Lords, and a House of Commons. Also you will find in the same place, that after the Saxons had received the faith of Christ, those bishops that were amongst them, were always at the great moots in which they made their laws. Thus you have a perfect English Parliament, saving that the name of Barons was not amongst them, as being a French title, which came in with the Conqueror.

An Answer to a Book Published by Dr. Bramhall, Late Bishop of Derry

1682 TEXT

[TO THE READER.](#)

[THAT THE HOBBIAN PRINCIPLES ARE DESTRUCTIVE TO
CHRISTIANITY AND ALL RELIGION.](#)

AN ANSWER TO A BOOK

Published by D^r. BRAMHALL, late Bishop of Derry; CALLED The
Catching of the Leviathan.

Together With an Historical Narration Concerning HERESIE, And the
Punishment thereof.

By THOMAS HOBBS of Malmesbury.

LONDON, Printed for W. Crooke at the Green Dragon without Temple-
Barr,

1682.

TO THE READER.

AS IN ALL things which I have written, so also in this Piece, I have endeavoured all I can to be perspicuous; but yet your own attention is always necessary. The late Lord Bishop of Derry published a Book called The Catching of Leviathan, in which he hath put together divers Sentences pickt out of my Leviathan, which stand there plainly and firmly proved, and sets them down without their Proofs, and without the order of their dependance one upon another; and calls them Atheism, Blasphemy, Impiety, Subversion of Religion, and by other names of that kind. My request unto you is, That when he cites my words for Erroneous, you will be pleased to turn to the place it self, and see whether they be well proved, and how to be understood. Which labour his Lordship might have saved you, if he would have vouchsafed, as well to have weighed my Arguments before you, as to have shewed you my Conclusions. His Book containeth two Chapters, the one concerning Religion, the other concerning Politicks. Because he does not so much as offer any refutation of any thing in my Leviathan concluded, I needed not to have answered either of them. Yet to the first I here answer, because the words Atheism, Impiety and the like, are words of the greatest defamation possible. And this I had done sooner, if I had sooner known that such a Book was extant. He wrote it ten years since, and yet I never heard of it till about three Months since; so little talk there was of his Lordship's Writings. If you want leasure or care of the questions between us, I pray you condemn me not upon report. To judge and not examine is not just. Farewell.

T. Hobbes.

THAT THE HOBBIAN PRINCIPLES ARE DESTRUCTIVE TO CHRISTIANITY AND ALL RELIGION.

J. D.

THE Image of God is not altogether defaced by the fall of Man, but that there will remain some practical notions of God and Goodness; which, when the mind is free from vagrant desires, and violent passions, do shine as clearly in the heart, as other speculative notions do in the head. Hence it is, That there was never any Nation so barbarous or savage throughout the whole world, which had not their God. They who did never wear cloaths upon their backs, who did never know Magistrate but their Father, yet have their God, and their Religious Rites and Devotions to him. Hence it is, That the greatest Atheists in any sudden danger do unwittingly cast their eyes up to Heaven, as craving aid from thence, and in a thunder creep into some hole to hide themselves. And they who are conscious to themselves of any secret Crimes, though they be secure enough from the justice of men, do yet feel the blind blows of a Guilty Conscience, and fear Divine Vengeance. This is acknowledged by T. H. himself in his lucid Intervals. That we may know what worship of God natural reason doth assign, let us begin with his attributes, where it is manifest in the first place, That existency is to be attributed to him. To which he addeth Infiniteness, Incomprehensibility, Vnity, Vbiquity. Thus for Attributes, next for Actions. Concerning external Actions, wherewith God is to be worshipped, the most general precept of reason is, that they be signs of honour, under which are contained Prayers, Thanksgivings, Oblations and Sacrifices.

T. H.

Hitherto his Lordship discharges me of Atheisme. What need he to say that All Nations, how barbarous soever, yet have their Gods and Religious Rites, and Atheists are frighted with thunder, and feel the blind blows of Conscience? It might have been as apt a Preface to any other of his Discourses as this. I expect therefore in the next place to be told that I deny again my afore recited Doctrine.

J. D.

Yet to let us see how inconsistent and irreconcilable he is with himself, elsewhere reckoning up all the Laws of Nature at large, even twenty in number, he hath not one word that concerneth Religion, or that hath the least relation in the world to God. As if a man were like the Colt of a wild Asse in the wilderness, without any owner or obligation. Thus in describing the Laws of Nature, this great Clerk forgetteth the God of Nature, and the main and principle Laws of Nature, which contains a mans duty to his God, and the principal end of his Creation.

T. H.

After I had ended the discourse he mentions of the Laws of Nature, I thought it fittest in the last place once for all, to say they were the Laws of God, then when they were delivered in the Word of God; but before being not known by men for any thing but their own natural reason, they were but Theorems, tending to peace, and those uncertain, as being but conclusions of particular men, and therefore not properly Laws. Besides, I had formerly in my Book De Cive, ca. proved them severally one by one out of the Scriptures; which his Lordship had read and knew. 'Twas therefore an unjust charge of his to say, I had not one word in them that concerns Religion, or that hath the least relation in the world to God; and this upon no other ground then that I added not to every article, This Law is in the Scripture. But why he should call me (ironically) a great Clerk, I cannot tell.

I suppose he would make men believe I arrogated to my self all the learning of a great Clerk, Bishop, or other inferior Minister. A Learned Bishop, is that Bishop that can interpret all parts of Scripture truly, and congruently to the harmony of the whole; that has learnt the History and Laws of the Church, down from the Apostles time to his own; and knows what is the nature of a Law Civil, Divine, Natural, and Positive; and how to govern well the Parochial Ministers of his Diocess, so that they may both by Doctrine and Example keep the people in the belief of all Articles of Faith necessary to Salvation, and in obedience to the Laws of their Country. This is a Learned Bishop. A Learned Minister is he that hath learned the way by which men may be drawn from Avarice, Pride, Sensuality, Prophaness, Rebellious Principles, and all other vices by eloquent and powerful disgracing them, both from Scripture and from Reason; and can terrify men from vice by discreet uttering of the punishments denounced against wicked men, and by deducing rationally the damage they receive by it in the end. In one word, he is a Learned Minister that can preach such Sermons as St. Chrisostome preached to the Antiochians when he was Presbyter in that City. Could his Lordship find in my Book that I arrogated to my self the eloquence or wisdom of St. Chrisostom, or the ability of governing the Church? 'Tis one thing to know what is to be done, another thing to know how to do it. But his Lordship was pleased to use any artifice to disgrace me in any kind whatsoever.

J. D.

Perhaps he will say that he handleth the Laws of Nature there, only so far as may serve to the constitution or settlement of a Common-wealth. In good time, let it be so. He hath devised us a trim Common-wealth, which is founded neither upon Religion towards God, nor Justice towards Man; but meerly upon self-interest, and self-preservation. Those raies of heavenly Light, those natural seeds of Religion, which God himself hath imprinted in

the heart of man, are more efficacious towards preservation of a Society; whether we regard the nature of the thing, or the blessing of God, then all his Pacts, and Surrenders, and Translations of power. He who unteacheth men their duty to God, may make them Eye-servants, so long as their interest doth oblige them to obey; but is no fit Master to teach men conscience and fidelity.

T. H.

He has not yet found the place where I contradict either the Existence, or Infiniteness, or Incomprehensibility, or Unity, or Ubiquity of God. I am therefore yet absolved of Atheism. But I am, he says, inconsistent and irreconcilable with my self, that is, I am, (though he says not so, he thinks) a forgetful blockhead. I cannot help that: But my forgetfulness appears not here. Even his Lordship where he says, Those raies of heavenly Light, those seeds of Religion, which God himself hath imprinted in the heart of man (meaning natural reason) are more efficacious to the preservation of Society, than all the Pacts, Surrenders, and Translating of Power, had forgotten to except the Old Pact of the Jews, and the New Pact of Christians. But pardoning that, did he hope to make any wise man believe, that when this Nation very lately was an Anarchy, and dissolute multitude of men, doing every one what his own reason or imprinted Light suggested, did again out of that same Light call in the King, and piece again, and ask pardon for the faults, which that their illumination had brought them into, rather than out of fear of perpetual danger, and hope of preservation.

J. D.

Without Religion, Societies are like but soapy bubbles, quickly dissolved. It was the judgment of as wise a man as, T. H. himself (though perhaps he will hardly be perswaded to it) that Rome ought more of its grandeur to Religion, than either to strength or stratagems. We have not exceeded the

Spaniards in number, nor the Galls in strength, nor the Carthaginians in craft, nor the Grecians in art, &c. but we have overcome all Nations by our Piety and Religion.

T. H.

Did not his Lordship forget himself here again, in approving this sentence of Tully, which makes the Idolatry of the Romans, not only better than the Idolatry of other Nations; but also better than the Religion of the Jews, whose Law Christ himself says, he came not to destroy but to fulfil? And that the Romans overcame both them and other Nations, by their Piety, when it is manifest that the Romans overran the world by injustice and cruelty, and that their Victories ought not to be ascribed to the Piety of the Romans, but to the impiety as well of the Jews as of other Nations? But what meant he by saying Tully was as wise a man as T. H. himself, though perhaps he will hardly be perswaded to it? Was that any part of the controversie? No: Then it was out of his way. God promiseth to assist good men in their way, but not out of their way. 'Tis therefore the less wonder that his Lordship was in this place deserted of the Light which God imprints in the hearts of rudest Savages.

J. D.

Among his Laws he incerteth gratitude to men as the third precept of the Law of Nature; but of the gratitude of mankind to their Creator, there is a deep silence. If men had sprung up from the earth in a night like Mushrooms or Excrecences, without all sence of Honour, Justice, Conscience, or Gratitude, he could not have vilified the humane nature more then he doth.

T. H.

My Lord discovers here an ignorance of such method as is necessary for lawful and strict reasoning and explication of the truth in controversie. And

not only that, but also how little able he is to fix his mind upon what he reads in other mens Writings. When I had defined Ingratitude universally, he finds fault that I do not mention Ingratitude towards God, as if his Lordship knew not that an universal comprehends all the particulars. When I had defined Equity universally, why did he not as well blame me for not telling what that Equity is in God? He is grateful to the man of whom he receives a good turn, that confesseth or maketh appear he is pleased with the benefit he receiveth. So also Gratitude towards God is to confess his benefits. There is also in Gratitude towards men a desire to requite their Benefits, so there is in our Gratitude towards God, so far to requite them, as to be kind to Gods Ministers, which I acknowledged in makeing Sacrifices a part of natural Divine Worship; and the benefit of those Sacrifices is the nourishment of Gods Ministers. It appears therefore that the Bishops attention in reading my Writings was either weak in it self, or weakned by prejudice.

J. D.

From this shameful omission or preterition of the main duty of mankind, a man might easily take the height of T. H. his Religion. But he himself putteth it past all conjectures. His principles are brim full of prodigious impiety. In these four things, Opinions of Ghosts, Ignorance of second Causes, devotion to what men fear, and taking of things casual, for Prognosticks, consisteth the natural seed of Religion; the culture and improvement whereof, he referreth only to Policy. Humane and Divine Politicks, are but Politicks. And again, Mankind hath this from the conscience of their own weakness, and the admiration of natural events, that the most part of men believe that there is an invisible God, the maker of all visible things. And a little after he telleth us, That Superstition proceedeth from fear without right reason, and Atheisme from an opinion of reason without fear; making Atheisme to be more reasonable than Superstition.

What is now become of that Divine Worship which natural reason did assign unto God, the honour of Existence, Infiniteness, Incomprehensibility, Unity, Ubiquity? What is now become of that Dictate or Precept of reason, concerning Prayers, Thanksgivings, Oblations, Sacrifices, if uncertain Opinions, Ignorance, Fear, Mistakes, the conscience of our own weakness, and the admiration of natural Events, be the only seeds of Religion?

He proceedeth further, That Atheisme it self, though it be an erroneous opinion, and therefore a sin, yet it ought to be numbred among the sins of imprudence or ignorance. He addeth, that an Atheist is punished not as a Subject is punished by his King, because he did not observe Laws: but as an Enemy, by an Enemy, because he would not accept Laws. His reason is, because the Atheist never submitted his will to the Will of God, whom he never thought to be. And he concludeth that mans obligation to obey God, proceedeth from his weakness. *Manifestum est obligationem ad prestandum ipsi (Deo) obedientiam, incumbere hominibus propter imbecilitatem.* First it is impossible that should be a sin of meer ignorance or imprudence, which is directly contrary to the light of natural reason. The Laws of nature need no new promulgation, being imprinted naturally by God in the heart of Man. The Law of nature was written in our hearts by the finger of God, without our assent; or rather the Law of Nature is the assent it self. Then if Nature dictate to us that there is a God, and that this God is to be worshipped in such and such manner, it is not possible that Atheism should be a sin of meer ignorance.

Secondly, a Rebellious Subject is still a Subject, *De Jure*, though not, *De Facto*, by right, though not by deed: and so the most cursed Atheist that is, ought by right to be the Subject of God, and ought to be punished not as a just Enemy, but as a disloyal Traytor. Which is confessed by himself, This fourth Sin, (that is, of those who do not by word and deed confess one God the Supreme King of Kings) in the natural Kingdom of God is the Crime of

High Treason, for it is a denial of Divine Power, or Atheism. Then an Atheist is a Traytor to God, and punishable as a disloyal Subject, not as an Enemy.

Lastly, it is an absurd and dishonourable assertion, to make our obedience to God to depend upon our weakness, because we cannot help it, and not upon our gratitude, because we owe our being and preservation to him. Who planteth a Vineyard, and eateth not of the Fruit thereof? And who feedeth a Flock, and eateth not of the Milk of the Flock? And again, Thou art worthy O Lord to receive Glory, and Honour, and Power, for thou hast created all things, and for thy pleasure they are and were created. But it were much better or at least not so ill, to be a down right Atheist, than to make God to be such a thing as he doth, and at last thrust him into the Devils Office, to be the cause of all Sin.

T. H.

Though this Bishop, as I said, had but a weak attention in reading, and little skill in examining the force of an Argument, yet he knew men, and the art, without troubling their judgments to win their assents by exciting their Passions. One Rule of his art was to give his Reader what he would have him swallow, a part by it self, and in the nature of News, whether true or not. Knowing that the unlearned, that is most men, are content to believe, rather than be troubled with examining, Therefore (a little before) he put these words T. H. no friend to Religion, in the Margent. And in this place, before he offer at any confutation, he says my Principles are brim full of Prodigious Impieties. And at the next Paragraph, in the Margent, he puts that I excuse Atheism. This behaviour becomes neither a Bishop, nor a Christian, nor any man that pretends to good education. Fear of invisible powers, what is it else in savage people, but the fear of somewhat they think a God? What invisible power does the reason of a savage man suggest unto him, but those Phantasms of his sleep, or his distemper, which we

frequently call Ghosts, and the Savages thought Gods; so that the fear of a God (though not of the true one) to them was the beginning of Religion, as the fear of the true God was the beginning of wisdom to the Jews and Christians? Ignorance of second causes made men fly to some first cause, the fear of which bred Devotion and Worship. The ignorance of what that power might do, made them observe the order of what he had done; that they might guess by the like order, what he was to do another time. This was their Prognostication. What Prodigious impiety is here? How confutes he it? Must it be taken for Impiety upon his bare calumny? I said Superstition was fear without reason. Is not the fear of a false God, or fancied Daemon contrary to right reason? And is not Atheism Boldness grounded on false reasoning, such as is this, the wicked prosper, therefore there is no God? He offers no proof against any of this; but says only I make Atheism to be more reasonable than Superstition; which is not true: For I deny that there is any reason either in the Atheist or in the Superstitious. And because the Atheist thinks he has reason, where he has none, I think him the more irrational of the two. But all this while he argues not against any of this; but enquires only, what is become of my natural Worship of God, and of his Existency, Infiniteness, Incomprehensibility, Unity, and Ubiquity. As if whatsoever reason can suggest, must be suggested all at once. First, all men by nature had an opinion of Gods Existency, but of his other Attributes not so soon, but by reasoning, and by degrees. And for the Attributes of the true God, they were never suggested but by the Word of God written. In that I say Atheism is a sin of ignorance, he says I excuse it. The Prophet David says, The fool hath said in his heart, There is no God. Is it not then a sin of folly? 'Tis agreed between us, that right reason dictates, There is a God. Does it not follow, that denying of God is a sin proceeding from misreasoning. If it be not a sin of ignorance, it must be a sin of malice. Can a man malice that which he thinks has no

being? But may not one think there is a God, and yet maliciously deny him? If he think there is a God, he is no Atheist; and so the question is changed into this, whether any man that thinks there is a God, dares deliberately deny it? For my part I think not. For upon what confidence dares any man (deliberately I say) oppose the Omnipotent? David saith of himself, My feet were ready to slip when I saw the prosperity of the wicked. Therefore it is likely the feet of men less holy slip oftner. But I think no man living is so daring, being out of passion, as to hold it as his opinion. Those wicked men that for a long time proceeded so succesfully in the late horrid Rebellion, may perhaps make some think they were constant and resolved Atheists, but I think rather that they forgot God, than believed there was none. He that believes there is such an Atheist, comes a little too near that opinion himself, Nevertheless, if words spoken in passion signifie a denial of a God, no punishment praeordained by Law, can be too great for such an insolence; because there is no living in a Common-wealth with men, to whose oaths we cannot reasonably give credit. As to that I say, An Atheist is punished by God not as a Subject by his King, but as an Enemy, and to my argument for it, namely, because he never acknowledged himself Gods Subject, He opposeth, That if nature dictate that there is a God, and to be worshiped in such and such manner, then Atheism is not a sin of meer ignorance; as if either I or he did hold that Nature dictates the manner of Gods Worship, or any article of our Creed, or whether to worship with or without a Surplice. Secondly, he answers that a Rebel is still a Subject de Jure, though not de Facto: And 'tis granted. But though the King lose none of his right by the Traytors act, yet the Traytor loseth the priviledg of being punisht by a praecedent Law; and therefore may be punish'd at the Kings will, as Ravillac was for murdering Henry the 4th. of France. An open Enemy and a perfidious Traytor are both enemies. Had not his Lordship read in the Roman story how Perseus and other just enemies of that State were wont to

be punished? But what is this trifling question to my excusing of Atheism? In the seventh Paragraph of my Book de Cive he found the words (in Latin) which he here citeth. And to the same sense I have said in my Leviathan, That the right of nature whereby God raigneth over men, is to be derived not from his creating them, as if he required obedience, as of Gratitude; but from his irresistable Power. This he says is absurd and dishonourable. Whereas first all power is honourable, and greatest power is most honourable. Is it not a more noble tenure for a King to hold his Kingdom, and the right to punish those that transgress his Laws from his Power, than from the gratitude or gift of the Transgressor. There is nothing therefore here of dishonour to God Almighty. But see the subtilty of his disputing. He saw he could not catch Leviathan in this place, he looks for him in my Book de Cive, which is Latine, to try what he could fish out of that. And says I make our obedience to God, depend upon our weakness, as if these words signified the Dependence, and not the necessity of our submission, or that incumbere and dependere were all one.

J. D.

For T. H. his God is not the God of Christians, nor of any rational men. Our God is every where, and seeing he hath no parts, he must be wholly here, and wholly there, and wholly every where. So Nature it self dictateth. It cannot be said honourably of God that he is in a place; for nothing is in a place, but that which hath proper bounds of its greatness. But T. H. his God is not wholly every where. No man can conceive that any thing is all in this place, and all in another place at the same time, for none of these things ever have or can be incident to sense. So far well, if by conceiving he mean comprehending; but then follows, That these are absurd Speeches taken upon credit, without any signification at all, from deceived Philosophers, and deceived or deceiving School-men. Thus he denieth the Ubiquity of

God. A Circumscriptive, a Definitive, and a Repletive being in a place, is some heathen language to him.

T. H.

Though I believe the Omnipotence of God, and that he can do what he will, yet I dare not say how every thing is done, because I cannot conceive nor comprehend either the Divine substance, or the way of its operation. And I think it Impiety to speak concerning God any thing of my own head, or upon the Authority of Philosophers or School-men, which I understand not, without warrant in the Scripture: And what I say of Omnipotence, I say also of Ubiquity. But his Lordship is more valiant in this place, telling us that God is wholly here, and wholly there, and wholly every where; because he has no parts. I cannot comprehend nor conceive this. For methinks it implies also that the whole World is also in the whole God, and in every part of God, nor can I conceive how any thing can be called Whole, which has no parts, nor can I find any thing of this in the Scripture. If I could find it there, I could believe it; and if I could find it in the publick Doctrine of the Church, I could easily abstain from contradicting it. The School-men say also that the Soul of Man (meaning his upper Soul, which they call the rational Soul) is also wholly in the whole man, and wholly in every part of the man. What is this but to make the humane Soul the same thing in respect of mans Body, that God is in respect of the World? These his Lordship calls here rational men, and some of them which applaud this Doctrine, would have the High Court of Parliament corroborate such Doctrines with a Law. I said in my Leviathan, that it is no honourable attribute to God, to say he is in a place, because, infinite is not confined within a place. To which he replies, T. H. his God is not wholly every where. I confess the consequence. For I understand in English, he that says any thing to be all here, means that neither all nor any of the same thing is else where. He says further, I take a Circumscriptive, a Definitive, and a

Repletive being in a place to be Heathen Language. Truly, if this Dispute were at the Bar, I should go near to crave the assistance of the Court, lest some trick might be put upon me in such obscurity. For though I know what these Latin words singly signifie, yet I understand not how any thing is in a Place Definitively and not Circumscriptively. For Definitively comes from *definio* which is to set bounds. And therefore to be in a Place Definitively, is when the bounds of the place are every way marked out. But to be in a place Circumscriptively, is when the bounds of the place are described round about. To be in a Place Repletive, is to fill a place. Who does not see that this dictinction is Canting and Fraud? If any man will call it Pious Fraud, he is to prove the Piety as clearly as I have here explained the Fraud. Besides, no Fraud can be Pious in any man, but him that hath a lawful Right to govern him whom he beguileth; whom the Bishop pretends to govern, I cannot tell. Besides his Lordship ought to have considered that every Bishop is one of the Great Councel, trusted by the King to give their advice with the Lords Temporal, for the making of good Laws, Civil and Ecclesiastical, and not to offer them such obscure Doctrines, as if, because they are not versed in School-divinity, therefore they had no Learning at all, nor understood the English Tongue. Why did the Divines of England contend so much heretofore to have the Bible translated into English, if they never meant any but themselves should read it? If a Lay-man be publickly encouraged to search the Scriptures for his own Salvation, what has a Divine to do to impose upon him any strange interpretation, unless if he make him err to Damnation, he will be damned in his stead?

J. D.

Our God is immutable without any shadow of turning by change, to whom all things are present, nothing past, nothing to come. But T. H. his God is measured by time, losing something that is past, and acquiring something that doth come every minute. That is as much as to say, That our God is infinite,

and his God is finite, for unto that which is actually infinite, nothing can be added neither time nor parts. Hear himself, Nor do I understand what derogation it can be to the divine perfection, to attribute to it Potentiality, that is in English, Power (so little doth he understand what Potentiality is) and successive duration. And he chargeth it upon us as a fault; that will not have eternity to be an endless succession of time. How, successive duration, and an endless succession of time in God? Then God is infinite, then God is elder to day than he was yesterday. Away with Blasphemies. Before he destroyed the Ubiquity of God, and now he destroyeth his Eternity.

T. H.

I shall omit both here and henceforth his preambulatory, impertinent, and uncivil calumnies. The thing he pretends to prove is this. That it is a derogation to the Divine Power to attribute to it Potentiality (that is in English Power) and Successive Duration. One of his reasons is, God is infinite, and nothing can be added to infinite, neither of time nor of parts: It is true. And therefore I said, God is infinite and eternal, without beginning or end, either of Time or Place; which he has not here confuted, but confirmed. He denies Potentiality and Power to be all one, and says I little understand what Potentiality is. He ought therefore in this place to have defined what Potentiality is: For I understand it to be the same with Potentia, which is in English Power. There is no such word as Potentiality in the Scriptures, nor in any Author of the Latin Tongue. It is found only in School-Divinity, as a word of Art, or rather as a word of Craft, to amaze and puzzle the Laity. And therefore I no sooner read than interpreted it. In the next place he says, as wondring, How an endless succession of time in God! Why not? Gods mercy endureth for ever, and surely God endureth as long as his mercy, therefore there is duration in God, and consequently endless succession of time. God who in sundry times and divers manners spake in time past, &c. But in a former dispute with me about Free-will, he hath

defined Eternity to be Nunc stans, that is an ever standing now, or everlasting instant. This he thinks himself bound in honour to defend. What reasonable soul can digest this? We read in Scripture, that a thousand years with God, is but as yesterday. And why? but because he sees as clearly to the end of a thousand years, as to the end of a day. But his Lordship affirms, That both a thousand years and a day are but one instant, the same standing Now, or Eternity. If he had shewed an holy Text for this Doctrine, or any Text of the Book of Common Prayer (in the Scripture and Book of Common Prayer is contained all our Religion) I had yielded to him, but School-Divinity I value little or nothing at all. Though in this he contradict also the School-men, who say the Soul is eternal only à parte post, but God is eternal both à parte post, and à parte ante. Thus there are parts in eternity, and eternity being, as his Lordship says, the divine substance, the divine substance has parts, and Nunc stans has parts. Is not this darkness? I take it to be the Kingdom of Darkness, and the teachers of it, especially of this Doctrine. That God who is not only Optimus, but also Maximus is no greater than to be wholly contained in the least Atome of earth, or other body, and that his whole duration is but an instant of time, to be either grosly ignorant or ungodly Deceivers.

J. D.

Our God is a perfect, pure, simple indivisible, infinite Essence; free from all composition of matter and form, of substance and accidents. All matter is finite, and he who acteth by his infinite Essence, needeth neither Organs, nor Faculties (id est, no power, note that) nor accidents, to render him more compleat. But T. H. his God is a divisible God, a compounded God, that hath matter, or qualities, or accidents. Hear himself. I argue thus, The divine substance is indivisible, but eternity is the divine substance. The Major is evident, because God is Actus simplicissimus; the Minor is confessed by all men, that whatsoever is attributed to God, is God. Now listen to his answer,

The Major is so far from being evident, that *Actus simplicissimus* signifieth nothing. The Minor is said by some men, thought by no man, whatsoever is thought is understood. The Major was this, The divine substance is indivisible. Is this far from being evident? Either it is indivisible or divisible. If it be not indivisible, then it is divisible, then it is materiate, then it is corporeal, then it hath parts, then it is finite by his own confession. *Habere partes, aut esse totum aliquid, sunt attributa finitorum.* Upon this silly conceit he chargeth me for saying, That God is not just, but justice it self; not eternal, but eternity it self; which he calleth unseemly words to be said of God. And he thinketh he doth me a great courtesie in not adding Blasphemous and Atheistical. But his Bolts are so soon shot, and his Reasons are such vain Imaginations, and such drowsie Phantasies, that no sad man doth much regard them. Thus he hath already destroyed the Ubiquity, the Eternity, and the Simplicity of God. I wish he had considered better with himself, before he had desperately cast himself upon these Rocks.

But paulo majora canamus, my next charge is, That he destroys the very being of God, and leaves nothing in his place, but an empty name. For by taking away all incorporeal substances, he taketh away God himself. The very name (saith he) of an incorporeal substance, is a Contradiction. And to say that an Angel or Spirit, is an incorporeal substance, is to say in effect, that there is no Angel or Spirit at all. By the same reason to say, That God is an incorporeal substance, is to say there is no God at all. Either God is incorporeal, or he is finite, and consists of parts, and consequently is no God. This, That there is no incorporeal spirit, is that main root of Atheism, from which so many lesser branches are daily sprouting up.

T. H.

God is indeed a Perfect, Pure, Simple, Infinite Substance; and his Name incommunicable, that is to say, not divisible into this and that individual God, in such manner as the name of Man is divisible into Peter and John. And therefore God is individual; which word amongst the Greeks is expressed by the word Indivisible. Certain Hereticks in the primitive Church, because special and individual are called Particulars, maintained that Christ was a particular God, differing in number from God the Father. And this was the Doctrine that was condemned for Heresy in the first Council of Nice, by these words, God hath no parts. And yet many of the Latin Fathers in their explications of the Nicene Creed, have expounded the word Consubstantial, by the community of nature, which different Species have in their Genus, and different individuals in the Species, as if Peter and John were Consubstantial, because they agree in one humane nature; which is contrary (I confess) to the meaning of the Nice Fathers. But that in a substance infinitely great, it should be impossible to consider any thing as not infinite. I do not see it there condemned. For certainly he that thinks God is in every part of the Church, does not exclude him out of the Church-yard. And is not this a considering of him by parts? For dividing a thing which we cannot reach nor separate one part thereof from another, is nothing else but considering of the same by parts. So much concerning Indivisibility from Natural Reason; for I will wade no farther, but relie upon the Scriptures. God is no where said in the Scriptures to be indivisible, unless his Lordship meant division, to consist only in separation of parts, which I think he did not. St. Paul indeed saith, 1 Cor. 1.13. Is Christ divided? Not that the followers of Paul, Apollo, and Cephas, followed some one part, some another of Christ; but that thinking differently of his nature, they made as it were different kinds of him. Secondly, his Lordship expounds Simplicity, by not being compounded of Matter and Form, or of Substance and Accidents, Unlearnedly. For nothing can be so compounded.

The matter of a Chair is Wood, the form is the figure it hath apt for the intended use. Does his Lordship think the Chair compounded of the Wood and the Figure? A man is Rational, does it therefore follow that Reason is a part of the man? It was Aristotle deceived him, who had told him that a Rational living Creature, is the definition of a man, and that the definition of a man was his Essence; and therefore the Bishop and other School-men, from this that the word Rational is a part of these words Man is a Rational living Creature, concluded that the Essence of man, was a part of the man, and a Rational man, the same thing with a Rational Soul. I should wonder how any man, much more a Doctor of Divinity, should be so grosly deceived, but that I know naturally the generality of men speak the words of their Masters by rote, without having any Idea of the things, which the words signifie. Lastly, he calls God an Essence. If he mean by Essence the same with Ens, (...) I approve it. Otherwise, what is Essence? There is no such word in the Old Testament. The Hebrew Language, which has no word answerable to the copulative est, will not bear it. The New Testament hath ..., but never for Essence, nor for Substance, but only for Riches. I come now to his Argument in Mood and Figure, which is this, The Divine Substance is indivisible. That's the Major. Eternity is the Divine Substance. That's the Minor. Ergo, the Divine Substance is indivisible. The Major, he says, is evident, because God is Actus simplicissimus. The Minor is confessed, he thinks, by all men, because whatsoever is attributed to God, is God. To this I answered, that the Major was so far from being evident, that Actus Simplicissimus signifieth nothing, and that the Minor was understood by no man. First, what is Actus in the Major? does any man understand Actus for a Substance, that is, for a thing subsisting by it self? Is not Actus in English, either an Act, or an Action, or nothing? or is any of these Substances? If it be evident, why did he not explain Actus by a definition? And as to the Minor, though all men in the world understand that the

Eternal is God, yet no man can understand that the Eternity is God. Perhaps he and the School-men mean by Actus, the same that they do by Essentia. What is the Essence of a man, but his Humanity? or of God, but his Deity; of Great, but Greatness; and so of all other denominating Attributes? And the words God and Deity, are of different signification. Damascene a Father of the Church expounding the Nicene Creed denies plainly that the Deity was incarnate, but all true Christians hold that God was incarnate. Therefore God and the Deity, signifie divers things; and therefore Eternal and Eternity are not the same, no more than a wise man and his wisdom are the same. Nor God and his justice the same thing, and universally 'tis false, that the Attribute in the Abstract is the same with the Substance, to which it is attributed. Also it is universally true of God, that the Attribute in the Concrete, and the substance to which it is attributed, is not the same thing. I come now to his next Period or Paragraph, wherein he would fain prove, that by denying Incorporeal Substance, I take away Gods Existence. The words he cites here are mine; To say an Angel or Spirit is an Incorporeal Substance, is to say in effect there is no Angel nor Spirit at all. It is true also, that to say that God is an Incorporeal Substance, is to say in effect there is no God at all. What alledges he against it, but the School-Divinity which I have already answered? Scripture he can bring none, because the word Incorporeal is not found in Scripture. But the Bishop trusting to his Aristotelean and Scholastick Learning hath hitherto made no use of Scripture, save only of these Texts, Who hath planted a Vineyard, and eateth not of the fruit thereof; or who feedeth a flock, and eateth not of the milk of the flock, and Rev. 4.11. Thou art worthy, O Lord, to receive glory, honour, and power, for thou hast created all things, and for thy pleasure they were created; thereby to prove that the right of God to govern and punish mankind is not derived from his Omnipotence. Let us now see how he proves Incorporeity by his own Reason without Scripture. Either God (he

saith) is Incorporeal or Finite. He knows I deny both, and say he is Corporeal and Infinite, against which he offers no proof, but only (according to his custom of disputing) calls it the root of Atheism; and interrogates me, what real thing is left in the world, if God be Incorporeal, but Body and Accidents? I say there is nothing left but Corporeal Substance. For I have denied (as he knew) that there is any reality in accidents; and nevertheless maintain Gods Existence, and that he is a most pure, and most simple Corporeal Spirit. Here his Lordship catching nothing, removes to the eternity of the Trinity, which these my grounds (he says) destroy. How so? I say the Trinity, and the Persons thereof are that one pure, simple, and eternal Corporeal Spirit; and why does this destroy the Trinity, more than if I had called it Incorporeal? He labours here and seeketh somewhat to refresh himself in the word Person, by the same grounds (he saith) every King has as many Persons as there be Justices of Peace in his Kingdom, and God Almighty hath as many Persons as there be Kings, why not? For I never said that all those Kings were that God; and yet God giveth that name to the Kings of the earth. For the signification of the word Person, I shall expound it by and by in another place. Here ends his Lordships School Argument; now let me come with my Scripture Argument. St. Paul concerning Christ, (Col. 2.9.) saith thus, In him dwelleth all the fullness of the Godhead Bodily. This place Athanasius a great and zealous Doctor in the Nicene Council, and vehement enemy of Arius the Heretick, who allowed Christ to be no otherwise God, then as men of excellent piety were so called, expoundeth thus. The fullness of the Godhead dwelleth in him Bodily (Greek ...) id est ..., id est, Realiter. So there is one Father for Corporality, and that God was in Christ in such manner as Body is in Body. Again, there were in the primitive Church a sort of Hereticks who maintained that Jesus Christ had not a true real Body, but was onely a Phantasm or Spright, such as the Latins called Spectra. Against the head of

this Sect (whose name I think was Apelles) Tertullian wrote a Book, now extant amongst his other Works, intituled *De Carne Christi*, wherein after he had spoken of the nature of Phantasms, and shewed that they had nothing of reality in them, he concludeth with these words, whatsoever is not Body, is Nothing. So here is on my side a plain Text of Scripture, and two ancient and learned Fathers, nor was this Doctrine of Tertullian condemned in the Council of Nice; but the division of the Divine Substance into God the Father, God the Son, and God the holy Ghost. For these words, God has no parts, were added, for explication of the word *Consubstantial*, at the request of the dissenting Fathers, and are farther explained both in Athanasius his Creed, in these words, not three Gods but one God, and by the constant Attribute ever since of the Individual Trinity. The same words nevertheless do condemn the Anthropomorphites also: For though there appeared no Christians that professed that God had an Organical Body, and consequently that the Persons were three Individuals, yet the Gentiles were all Anthropomorphites and there condemned by those words, God has no parts.

And thus I have answered his accusation concerning the Eternity and Existence of the Divine Substance, and made appear that in truth, the question between us, is whether God be a Phantasme (*id est*, an Idol of the Fancy, which St. Paul saith is nothing) or a Corporeal Spirit, that is to say, something that has Magnitude.

In this place I think it not amiss, leaving for a little while this Theological dispute, to examine the signification of those words which have occasioned so much diversity of opinion in this kind of Doctrine.

The word Substance, in Greek *Hypostasis*, *Hypostan*, *Hypostamenon* signifie the same thing, namely, a Ground, a Base, any thing that has Existence or Subsistence in it self, any thing that upholdeth that which else would fall, in which sence God is properly the *Hypostasis*, Base, and Substance that upholdeth all the world, having Subsistence not only in

himself, but from himself; whereas other Substances have their subsistence only in themselves, not from themselves. But Metaphorically, Faith is called a Substance, Heb. 11.1. because it is the foundation or Base of our Hope; for Faith failing our Hope falls. And 2 Cor. 9.4. St. Paul having boasted of the liberal promise of the Corinthians towards the Macedonians, calls that promise the ground, the Hypostasis of that his boasting. And Heb. 1.3. Christ is called the Image of the Substance (the Hypostasis) of his Father, and for the proper and adequate signification of the word Hypostasis, the Greek Fathers did always oppose it to Apparition or Phantasme; as when a man seeth his face in the water, his real face is called the Hypostasis of the phantastick face in the water. So also in speaking, the thing understood or named, is called Hypostasis, in respect of the name, so also a Body coloured is the Hypostasis, Substance and Subject of the colour; and in like manner of all its other Accidents. Essence and all other abstract names are words artificial belonging to the Art of Logick, and signifies only the manner how we consider the Substance it self. And of this I have spoken sufficiently in Pag. 371.372. of my Leviathan. Body [Lat.] Corpus [Grae.]..., is that Substance which hath Magnitude indeterminate, and is the same with Corporeal Substance; but A Body is that which hath Magnitude determinate, and consequently is understood to be totum or integrum aliquid. Pure and Simple Body, is Body of one and the same kind, in every part throughout, and if mingled with Body of another kind, though the total be compounded or mixt, the parts nevertheless retain their simplicity, as when water and wine are mixt, the parts of both kinds retain their simplicity. For water and wine cannot both be in one and the same place at once.

Matter is the same with Body; But never without respect to a Body which is made thereof. Form is the aggregate of all Accidents together, for which, we give the Matter a new name; so Albedo, whiteness is the Form of

Album, or white Body. So also Humanity is the Essence of man, and Deity the Essence of Deus.

Spirit is Thin, Fluid, Transparent, Invisible Body. The word in Latin signifies Breath, Aire, Wind and the like. In Greek ... from ..., Spiro, Flo.

I have seen, and so have many more two waters, one of the River, the other a Mineral Water, so like, that no man could discern the one from the other by his sight; yet when they have been both put together, the whole substance could not by the eye be distinguished from milk. Yet we know that the one was not mixt with the other, so as every part of the one to be in every part of the other, for that is impossible, unless two Bodies can be in the the same place. How then could the change be made in every part, but only by the Activity of the Mineral water, changing it every where to the Sense, and yet not being every where and in every part of the water? If then such gross Bodies have so great Activity, what shall we think of Spirits, whose kinds be as many as there be kinds of Liquor, and Activity greater? Can it then be doubted, but that God, who is an infinitely fine Spirit and withall intelligent, can make and change all species and kinds of Body as he pleaseth; but I dare not say, that this is the way by which God Almighty worketh, because it is past my apprehension, yet it serves very well to demonstrate, that the Omnipotence of God implieth no contradiction; and is better than by pretence of magnifying the fineness of the divine Substance, to reduce it to a Spright or Phantasm, which is Nothing.

A Person, [Lat.] Persona, signifies an intelligent Substance, that acteth any thing in his own or anothers Name, or by his own or anothers Authority. Of this Definition there can be no other proof than from the use of that word, in such Latin Authors as were esteem'd the most skilful in their own Language, of which number was Cicero. But Cicero, in an Epistle to Atticus, saith thus, Vnus sustineo tres Personas, Mei, Adversarii, & Judicis: That is, I that am but one man, sustain three Persons; mine own Person, the

Person of my Adversary, and the Person of the Judge. Cicero was here the Substance intelligent, one man; and because he pleaded for himself, he calls himself, his own Person; and again, because he pleaded for his Adversary, he says, he sustained the Person of his Adversary; and lastly, because he himself gave the Sentence, he says, he sustained the Person of the Judge. In the same sence we use the word in English vulgarly, calling him that acteth by his own Authority, his own Person, and him that acteth by the Authority of another, the Person of that other. And thus we have the exact meaning of the word Person. The Greek Tongue cannot render it; for ... is properly a Face, and Metaphorically, a Vizard of an Actor upon the Stage. How then did the Greek Fathers render the word Person, as it is in the blessed Trinity? Not well. Instead of the word Person they put Hypostasis, which signifies Substance, from whence it might be inferr'd, that the three Persons in the Trinity are three divine Substances, that is, three Gods. The word ..., they could not use, because Face and Vizard are neither of them honourable Attributes of God, nor explicative of the meaning of the Greek Church. Therefore the Latin (and consequently the English) Church renders Hypostasis every where in Athanasius his Creed by Person. But the word Hypostatical Vnion is rightly retained and used by Divines, as being the Union of two Hypostases, that is, of two Substances or Natures in the Person of Christ. But seeing they also hold the Soul of our Saviour to be a Substance, which though separated from his Body, subsisted nevertheless in it self, and consequently before it was separated from his Body upon the Cross, was a distinct Nature from his Body, how will they avoid this Objection, That then Christ had three Natures, three Hypostases, without granting, that his Resurrection was a new vivification, and not a return of his Soul out of Heaven into the Grave? The contrary is not determined by the Church. Thus far in explication of the words that occur in this Controversie. Now I return again to his Lordship's Discourse.

J. D.

When they have taken away all incorporeal Spirits, what do they leave God himself to be? He who is the Fountain of all Being, from whom and in whom all Creatures have their Being, must needs have a real Being of his own. And what real Being can God have among Bodies and Accidents? for they have left nothing else in the Universe. Then T. H. may move the same Question of God, which he did of Devils. I would gladly know in what Classis of Entities, the Bishop ranketh God? Infinite Being and participated Being are not of the same nature. Yet to speak according to humane apprehension, (apprehension and comprehension differ much: T. H. confesseth that natural Reason doth dictate to us, that God is Infinite, yet natural Reason cannot comprehend the Infiniteness of God) I place him among incorporeal Substances or Spirits, because he hath been pleased to place himself in that rank, God is a Spirit. Of which place T. H. giveth his opinion, that it is unintelligible, and all others of the same nature, and fall not under humane understanding.

They who deny all incorporeal Substances, can understand nothing by God, but either Nature, (not Naturam naturantem, that is, a real Author of Nature, but Naturam naturatam, that is, the orderly concourse of natural Causes, as T. H. seemeth to intimate) or a fiction of the Brain, without real Being, cherished for advantage and politick Ends, as a profitable Error, howsoever dignified with the glorious title of the eternal Cause of all things.

T. H.

To his Lordship's Question here, What I leave God to be, I answer, I leave him to be a most pure, simple, invisible Spirit Corporeal. By Corporeal I mean a Substance that has Magnitude, and so mean all learned men, Divines and others, though perhaps there be some common people so rude as to call nothing Body, but what they can see and feel. To his second

Question, What real Being he can have amongst Bodies and Accidents, I answer, The Being of a Spirit, not of a Spright. If I should ask any the most subtil Distinguisher, what middle nature there were between an infinitely subtil Substance, and a meer Thought or Phantasm, by what Name could he call it? He might call it perhaps an Incorporeal Substance, and so Incorporeal shall pass for a middle nature between Infinitely subtil and Nothing, and be less subtil than Infinitely subtil, and yet more subtil than a thought. 'Tis granted (he says) that the Nature of God is incomprehensible. Doth it therefore follow, that we may give to the divine Substance what negative Name we please? Because he says, the whole divine Substance is here and there and every where throughout the World, and that the Soul of a man is here and there and every where throughout man's Body, must we therefore take it for a Mystery of Christian Religion, upon his or any Schoolman's word, without the Scripture, which calls nothing a Mystery but the Incarnation of the eternal God? Or is Incorporeal a Mystery, when not at all mentioned in the Bible, but to the contrary 'tis written, That the fulness of the Deity was bodily in Christ? When the nature of the thing is incomprehensible, I can acquiesce in the Scripture, but when the signification of words are incomprehensible, I cannot acquiesce in the Authority of a Schoolman.

J. D.

We have seen what his Principles are concerning the Deity, they are full as bad or worse concerning the Trinity. Hear himself. A person is he that is represented as often as he is represented. And therefore God who has been represented, that is, personated thrice, may properly enough be said to be three Persons, though neither the word Person nor Trinity be ascribed to him in the Bible. And a little after, To conclude, the doctrine of the Trinity as far as can be gathered directly from the Scripture, is in substance this, that the God who is always one and the same, was the Person represented

by Moses, the Person represented by his Son incarnate, and the Person represented by the Apostles. As represented by the Apostles, the holy Spirit by which they spake is God. As represented by his Son that was God and Man, the Son is that God. As represented by Moses, and the High Priests, the Father, that is to say, the Father of our Lord Jesus Christ is that God. From whence we may gather the reason why those Names, Father, Son, and Holy Ghost, in the signification of the Godhead, are never used in the Old Testament. For they are Persons, that is, they have their Names from representing, which could not be, till divers Persons had represented God, in ruling or in directing under him.

Who is so bold as blind Bayard? The Emblem of a little Boy attempting to lade all the Water out of the Sea with a Cockle-shell, doth fit T. H. as exactly as if it had been shaped for him, who thinketh to measure the profound and inscrutable Mysteries of Religion, by his own silly, shallow conceits. What is now become of the great adorable Mystery of the blessed undivided Trinity? It is shrunk into nothing? Upon his grounds there was a time when there was no Trinity. And we must blot these words out of our Creed, The Father eternal, the Son eternal, and the Holy Ghost eternal. And these other words out of our Bibles, Let us make man after our Image. Unless we mean that this was a consultation of God with Moses and the Apostles. What is now become of the eternal generation of the Son of God, if this Sonship did not begin until about 4000 years after the Creation were expired? Upon these grounds every King hath as many Persons, as there be Justices of Peace, and petty Constables in his Kingdom. Upon this account God Almighty hath as many Persons, as there have been Sovereign Princes in the World since Adam. According to this reckoning each one of us like so many Geryons, may have as many Persons as we please to make Procurations. Such bold presumption requireth another manner of confutation.

T. H.

As for the words recited, I confess there is a fault in the Ratiocination, which nevertheless his Lordship hath not discovered, but no Impiety. All that he objecteth is, That it followeth hereupon, that there be as many Persons of a King, as there be petty Constables in his Kingdom. And so there are, or else he cannot be obeyed. But I never said that a King, and every one of his Persons are the same Substance. The fault I here made, and saw not was this; I was to prove, That it is no contradiction (as Lucian, and Heathen Scoffers would have it) to say of God, he was One and Three. I saw the true definition of the word Person would serve my turn in this manner; God in his own Person both created the World, and instituted a Church in Israel, using therein the Ministry of Moses; the same God in the Person of his Son God and Man redeemed the same World, and the same Church; the same God in the Person of the Holy Ghost sanctified the same Church, and all the faithful men in the World. Is not this a clear proof, that it is no contradiction to say that God is three Persons and one Substance? And doth not the Church distinguish the Persons in the same manner? See the words of our Catechism. Quest. What dost thou chiefly learn in these Articles of thy Belief? Answ. First, I learn to believe in God the Father, that hath made me and all the World; Secondly, In God the Son, who hath redeemed me and all Mankind; Thirdly, In God the Holy Ghost, that hath sanctified me and all the elect people of God But at what time was the Church sanctified? Was it not on the day of Pentecost, in the descending of the Holy Ghost upon the Apostles? His Lordship all this while hath caught nothing. 'Tis I that caught my self, for saying, (instead of, By the Ministry of Moses) in the Person of Moses. But this Error I no sooner saw, then I no less publickly corrected then I had committed it, in my Leviathan converted into Latin, which by this time I think is printed beyond the Seas with this alteration, and also with the omission of some such passages as Strangers

are not concerned in. And I had corrected this Error sooner, if I had sooner found it. For though I was told by Dr. Cosins, now Bishop of Duresme, that the place above-cited was not applicable enough to the Doctrine of the Trinity, yet I could not in reviewing the same espy the defect till of late, when being solicited from beyond Sea to translate the Book into Latin, and fearing some other man might do it not to my liking, I examined this passage and others of the like sence more narrowly. But how concludes his Lordship out of this, that I put out of the Creed these words, The Father eternal, the Son eternal, the Holy Ghost eternal? Or these words, Let us make man after our Image, out of the Bible. Which last words neither I nor Bellarmine put out of the Bible, but we both put them out of the number of good Arguments to prove the Trinity; for it is no unusual thing in the Hebrew, as may be seen by Bellarmine's quotations, to joyn a Noun of the plural Number with a Verb of the singular. And we may say also of many other Texts of Scripture alledged to prove the Trinity, that they are not so firm as that high Article requireth. But mark his Lordship's Scholastick charity in the last words of this period, Such bold presumption requireth another manner of confutation. This Bishop, and others of his opinion had been in their Element, if they had been Bishops in Queen Maries time.

J. D.

Concerning God the Son, forgetting what he had said elsewhere, where he calleth him God and Man, and the Son of God incarnate, he doubteth not to say, that the word Hypostatical is canting. As if the same Person could be both God and Man without a Personal, that is, an Hypostatical Union of the two Natures of God and Man.

T. H.

If Christian Profession be (as certainly it is in England) a Law, and if it be of the nature of a Law to be made known to all men that are to obey it, in

such manner as they may have no excuse for disobedience from their ignorance, then without doubt all words unknown to the people, and as to them insignificant, are Canting. The word Substance is understood by the Vulgar well enough, when it is said of a Body, but in other sence not at all, except for their Riches. But the word Hypostatical is understood only by those, and but few of those that are learned in the Greek Tongue, and is properly used, as I have said before, of the Union of the two Natures of Christ in one Person. So likewise Consubstantial in the Nicene Creed, is properly said of the Trinity. But to an English man that understands neither Greek nor Latin, and yet is as much concerned as his Lordship was, the word Hypostatical is no less Canting than Eternal now.

J. D.

He alloweth every man who is commanded by his lawful Sovereign, to deny Christ with his tongue before men.

T. H.

I allow it in some Cases, and to some men, which his Lordship knew well enough, but would not mention. I alledged for it, in the place cited, both Reason and Scripture, though his Lordship thought it not expedient to take notice of either. If it be true that I have said, why does he blame it? If false, why offers he no Argument against it, neither from Scripture nor from Reason? Or why does he not show that the Text I cite is not applicable to the Question, or not well interpreted by me. First, He barely cites it, because he thought the words would sound harshly, and make a Reader admire them for Impiety. But I hope I shall so well instruct my Reader ere I leave this place, that this his petty Art will have no effect. Secondly, The Cause why he omitted my Arguments was, That he could not answer them. Lastly, The Cause why he urgeth neither Scripture nor Reason against it was, That he saw none sufficient. My Argument from Scripture was this, (Leviathan,

pag. 271.) taken out of 2 Kings 5.17. where Naaman the Syrian saith to Elisha the Prophet, Thy servant will henceforth offer neither burnt-offering nor sacrifice to other Gods, but unto the Lord. In this thing the Lord pardon thy servant, that when my Master goeth into the house of Rimmon to worship there, and he leaneth on my hand, and I bow my self in the house of Rimmon: when I bow my self in the house of Rimmon, the Lord pardon thy servant in this thing, and he said unto him, Go in peace. What can be said to this? Did not Elisha say it from God? Or is not this Answer of the Prophet a permission? When St. Paul and St. Peter commanded the Christians of their time to obey their Princes, which then were Heathens and Enemies of Christ, did they mean they should lose their Lives for disobedience? Did they not rather mean they should preserve both their Lives and their Faith, (believing in Christ as they did) by this denial of the tongue, having no command to the contrary? If in this Kingdom a Mahometan should be made by terror to deny Mahomet and go to Church with us, would any man condemn this Mahometan? A denial with the mouth may perhaps be prejudicial to the power of the Church, but to retain the Faith of Christ stedfastly in his Heart, cannot be prejudicial to his Soul that hath undertaken no charge to Preach to Wolves, whom they know will destroy them. About the time of the Council of Nice, there was a Canon made (which is extant in the History of the Nicene Council) concerning those that being Christians had been seduced, not terrified, to a denial of Christ, and again repenting, desired to be readmitted into the Church; in which Canon it was ordain'd that those men should be no otherwise readmitted than to be in the number of the Catechised, and not to be admitted to the Communion till a great many years penitence. Surely the Church then would have been more merciful to them that did the same upon terror of present death and torments.

Let us now see what his Lordship might, though but colourably, have alledged from Scripture against it. There be three Places only that seem to favour his Lordship's opinion. The first is where Peter denied Christ, and Weepeth. The second is, Acts 5.29. Then Peter and the other Apostles answered and said, we ought to obey God rather than men. The third is, Luke 12.9. But he that denyeth me, shall be denyed before the Angels of God.

T. H.

For answer to these Texts, I must repeat what I have written, and his Lordship read in my Leviathan, pag. 362. For an unlearned man that is in the power of an Idolatrous King, or State, if commanded on pain of Death to worship before an Idol, doing it, he detesteth the Idol in his Heart, he doth well; though if he had the fortitude to suffer Death, rather than worship it, he should do better. But if a Pastor, who as Christ's Messenger has undertaken to teach Christ's Doctrine to all Nations should do the same, it were not only a sinful Scandal in respect of other Christian Mens Consciences, but a perfidious forsaking of his Charge. In which words I distinguish between a Pastor and one of the Sheep of his Flock. St. Peter sinned in denying Christ; and so does every Pastor that having undertaken the Charge of Preaching the Gospel in the Kingdom of an Infidel, where he could expect at the undertaking of his Charge no less than Death. And why, but because he violates his Trust in doing contrary to his Commission. St. Peter was an Apostle of Christ, and bound by his voluntary undertaking of that Office, not only to Confess Christ, but also to Preach him before those Infidels whom he knew would (like Wolves) devour him. And therefore when Paul and the rest of the Apostles were forbidden to preach Christ they gave this Answer, We ought to obey God rather than Men. And it was to his Disciples only which had undertaken that Office, that Christ saith, he that denyeth me before Men, shall be denyed before the Angels of God. And so

I think I have sufficiently answered this place, and shewed that I do not allow the denying of Christ, upon any colour of Torments, to his Lordship, nor to any other that has undertaken the Office of a Preacher. Which if he think right, he will perhaps in this case put himself into the number of those whom he calls merciful Doctors, whereas now he extends his severity beyond the bounds of common equity. He has read Cicero, and perhaps this Story in him. The Senate of Rome would have sent Cicero to treat of Peace with Marcus Antonius, but when Cicero had shewed them the just fear he had of being killed by him, he was excused; and if they had forced him to it, and he by terror turned Enemy to them, he had in equity been excusable. But his Lordship I believe did write this more valiantly than he would have acted it.

J. D.

He Deposeth Christ from his true Kingly Office, making his Kingdom not to Commence or begin before the day of Judgment. And the Regiment wherewith Christ Governeth his Faithful in this Life, is not properly a Kingdom, but a Pastoral Office, or a right to Teach. And a little after, Christ had not Kingly Authority committed to him by his Father in this World, but only Consiliary and Doctrinal.

T. H.

How do I take away Christs Kingly Office? He neither draws it by Consequence from my Words, nor offers any Argument at all against my Doctrine. The words he cites are in the Contents of Cha. de Cive. In the Body of the Chapter it is thus. The time of Christ's being upon the Earth is called in Scripture the Regeneration often, but the Kingdom never. When the Son of God comes in Majesty, and all the Angels with him, then he shall sit on the seat of Majesty. My Kingdom is not of this World. God sent not

his Son that he should Judge the World. I came not to Judge the World, but to save the World. Man, who made me a Judge or Divider amongst you? Let thy Kingdom come. And other words to the same purpose; out of which it is clear that Christ took upon him no Regal Power upon Earth before his Assumption. But at his Assumption his Apostles asked him if he would then restore the Kingdom to Israel, and he Answered, it was not for them to know. So that hitherto Christ had not taken that Office upon him, unless his Lordship think that the Kingdom of God, and the Kingdom of Christ be two distinct Kingdoms. From the Assumption ever since, all true Christians say daily in their Prayers, Thy Kingdom come. But his Lordship had perhaps forgot that. But when then beginneth Christ to be a King? I say it shall be then when he comes again in Majesty with all the Angels. And even then he shall Reign (as he is Man) under his Father. For St. Paul saith, 1 Cor. 15.25, 26. He must Raigh till he hath put all Enemies under his feet; the last Enemy that shall be destroyed is Death. But when shall God the Father Raigh again? St. Paul saith in the same Chapter verse 28. When all things shall be subdued unto him, then shall the Son also himself be subject unto him that put all things under him, that God may be all in all. And verse 24. Then cometh the end, when he shall have delivered up the Kingdom to God even the Father; when he shall have put down all Rule, Authority and Power. This is at the Resurrection. And by this it is manifest, that his Lordship was not so well versed in Scripture, as he ought to have been.

J. D.

He taketh away his Priestly or Propitiatory Office; And although this Act of our Redemption be not alwayes in Scripture called a Sacrifice and Oblation, but sometimes a Price, yet by Price we are not to understand any thing, by the value whereof he could claim right to a Pardon for us from his Offended Father, but that Price which God the Father was pleased in mercy

to demand. And again, Not that the Death of one Man, though without sin, can satisfie for the Offences of all Men in the rigour of Justice, but in the mercy of God, that ordained such Sacrifices for sin, as he was pleased in mercy to accept. He knoweth no difference between one who is meer man, and one who was both God and man; between a Levitical Sacrifice, and the All-sufficient Sacrifice of the Cross; between the Blood of a Calf, and the precious Blood of the Son of God.

T. H.

Yes, I know there is a difference between Blood and Blood, but not any such as can make a difference in the Case here questioned. Our Saviour's Blood was most precious, but still it was Humane Blood; and I hope his Lordship did never think otherwise, or that it was not accepted by his Father for our Redemption.

J. D.

And touching the Prophetical Office of Christ, I do much doubt whether he do believe in earnest, that there is any such thing as Prophecy in the World. He maketh very little difference between a Prophet and a Mad-man, and a Demoniack. And if there were nothing else (says he) that bewrayed their madness, yet that very arrogating such inspiration to themselves, is Argument enough. He maketh the pretence of Inspiration in any man to be, and always to have been, an opinion pernicious to Peace, and tending to the dissolution of all Civil Government. He subjecteth all Prophetical Revelations from God, to the sole Pleasure and Censure of the Sovereign Prince, either to Authorize them, or to Exauctorate them. So as two Prophets prophecying the same thing at the same time, in the Dominions of two different Princes, the one shall be a true Prophet, the other a false. And Christ who had the approbation of no Sovereign Prince, upon his grounds, was to be reputed a false Prophet every where. Every man therefore ought

to consider who is the Sovereign Prophet, that is to say, who it is that is Gods Vicegerent upon Earth, and hath next under God the Authority of governing Christian Men, and to observe for a Rule that Doctrine which in the Name of God he hath Commanded to be taught, and thereby to examine and try out the truth of those Doctrines which pretended Prophets, with miracle, or without, shall at any time advance, &c. And if he disavow them then no more to obey their Voice; or if he Approve them, then to obey them as Men, to whom God hath given a part of the Spirit of their Sovereign. Upon his Principles the case holdeth as well among Jews and Turks and Heathens, as Christians. Then he that Teacheth Transubstantiation in France, is a true Prophet; he that Teacheth it in England, a false Prophet. He that Blasphemeth Christ in Constantinople, a true Prophet; he that doth the same in Italy, a false Prophet. Then Samuel was a false Prophet to Contest with Saul a Sovereign Prophet: So was the Man of God who submitted not to the more Divine and Prophetick Spirit of Jeroboam. And Elijah for Reproving Ahab. Then Michaiah had but his deserts, to be clapt up in Prison, and fed with Bread of Affliction, and Water of Affliction, for daring to Contradict God's Vice-gerent upon Earth. And Jeremiah was justly thrown into a Dungeon, for Prophecying against Zedekiah his Liege Lord. If his Principles were true, it were strange indeed, that none of all these Princes, nor any other that ever was in the World, should understand their own Priviledges. And yet more strange, that God Almighty should take the part of such Rebellious Prophets, and justifie their Prophecies by the Event, if it were true that none but the Sovereign in a Christian (the Reason is the same for Jewish) Commonwealth can take notice, what is or what is not the Word of God.

T. H.

To remove his Lordships doubt in the first place, I confess there was true Prophecie and true Prophets in the Church of God, from Abraham down to

our Saviour the greatest Prophet of all, and the last of the Old Testament, and first of the New. After our Saviour's time, till the Death of St. John the Apostle, there were true Prophets in the Church of Christ, Prophets to whom God spake Supernaturally, and Testified the truth of their Mission by Miracles. Of those that in the Scripture are called Prophets without Miracles, and for this cause only, that they spake in the Name of God to Men, and in the name of Men to God, there are, have been, and shall be in the Church Innumerable. Such a Prophet was his Lordship, and such are all Pastors in the Christian Church. But the Question here is of those Prophets that from the Mouth of God foretell things Future, or do other Miracle. Of this kind I deny there has been any since the Death of St. John the Evangelist. If any Man find fault with this, he ought to Name some Man or other whom we are bound to acknowledge that they have done a Miracle, cast out a Devil, or cured any Disease by the sole Invocation of the Divine Majesty. We are not bound to trust to the Legend of the Roman Saints, nor to the History written by Sulpitius of the Life of St. Martin, or to any other Fables of the Roman Clergy, nor to such things as were pretended to be done by some Divines here in the time of King James. Secondly, he says I make little difference between a Prophet and a Mad-man, or Demoniack; To which I say he accuses me falsly. I say only thus much, That I see nothing at all in the Scripture that requireth a belief, that Demoniacks were any other thing than Madmen. And this is also made very probable out of Scripture by a worthy Divine Mr. Meade. But concerning Prophets, I say only that the Jews both under the Old Testament and under the New, took them to be all one with Mad-men and Demoniacks. And prove it out of Scripture by many places both of the Old and New Testament. Thirdly, that the pretence or arrogating to ones self Divine Inspiration, is argument enough to shew a Man is Mad, is my opinion; but his Lordship understands not Inspiration in the same sence that I do. He understands it properly of God's breathing into

a Man, or pouring into him the Divine Substance, or Divine Graces, and in that sence, he that arrogateth Inspiration into himself, neither understands what he saith, nor makes others to understand him, which is properly Madness in some degree. But I understand Inspiration in the Scripture Metaphorically, for Gods guidance of our minds to Truth and Piety. Fourthly, whereas he says, I make the pretence of Inspiration to be pernicious to Peace. I answer, that I think his Lordship was of my Opinion, for he called those Men which in the late Civil War pretended the Spirit, and New Light, and to be the only faithful men Phanaticks; for he called them in his Book, and did call them in his Life time Phanaticks. And what is a Phanatick but a Madman, and what can be more pernicious to Peace than the Revelations that were by these Phanaticks pretended? I do not say there were Doctrines of other Men, not called Phanaticks as pernicious to Peace, as theirs were, and in great part a cause of those troubles. Fifthly, from that I make Prophetical Revelations subject to the examination of the Lawful Sovereign, he inferreth, that two Prophets prophecyng the same thing at the same time, in the Dominions of two different Princes, the one shall be a true Prophet, the other a false. This consequence is not good, for seeing they teach different Doctrines, they cannot both of them confirm their Doctrine with Miracles. But this I prove (in the page 232 he citeth) that, whether either of their Doctrines shall be Taught Publickly or not, 'tis in the power of the Sovereign of the Place only to determine. Nay, I say now further, if a Prophet come to any private Man in the Name of God, that Man shall be Judge whether he be a true Prophet or not, before he obey him. See 1 John 4.1. Sixthly, whereas he says, that upon my grounds Christ was to be reputed a false Prophet every where, because his Doctrine was received nowhere. His Lordship had Read my Book more negligently than was fit for one that would confute it. My ground is this, that Christ in right of his Father was King of the Jews, and consequently Supream Prophet, and Judge

of all Prophets. What other Princes thought of his Propheties, is nothing to the purpose. I never said that Princes can make Doctrines or Propheties true or false, but I say every Sovereign Prince has a right to prohibite the publick Teaching of them, whether false or true. But what an oversight is it in a Divine to say, that Christ had the Approbation of no Sovereign Prince, when he had the Approbation of God, who was King of the Jews, and Christ his Vice-Roy, and the whole Scripture Written (Joh. 20.31.) to prove it? When his Miracles declared it; when Pilate confessed it; and when the Apostles Office was to Proclaim it? Seventhly, If we must not consider in points of Christian Faith who is the Sovereign Prophet, that is, who is next under Christ our Supream Head and Governor, I wish his Lordship would have cleared, ere he dyed, these few Questions, Is there not need of some Judge of Controverted Doctrines? I think no man can deny it, that has seen the Rebellion that followed the Controversie here between Gomar and Arminius. There must therefore be a Judge of Doctrines. But (says the Bishop) not the King. Who then? Shall Dr. Bramhall be this Judge? As profitable an Office as it is, he was more modest than to say that. Shall a private Layman have it? No man ever thought that. Shall it be given to a Presbyterian Minister? No; 'tis unreasonable. Shall a Synod of Presbyterians have it? No; For most of the Presbyters in the Primitive Church were undoubtedly subordinate to Bishops, and the rest were Bishops. Who then? A Synod of Bishops? Very well. His Lordship being too Modest to undertake the whole Power, would have been contented with the six and twentieth part. But suppose it in a Synod of Bishops, who shall call them together? The King. What if he will not? Who should Excommunicate him, or if he despise your Excommunication, who shall send forth a Writ of Significavit? No; all this was far from his Lordships thoughts. The power of the Clergy, unless it be upheld legally by the King, or illegally by the Multitude amounts to nothing. But for the Multitude,

Suarez and the School-men will never gain them, because they are not understood. Besides there be very few Bishops that can act a Sermon (which is a puissant part of Rhetorick) So well as divers Presbyterians, and Phanatick Preachers can do. I conclude therefore, that his Lordship could not possibly believe that the Supream Judicature in matter of Religion could any where be so well placed as in the Head of the Church, which is the King. And so his Lordship and I think the same thing; but because his Lordship knew not how to deduce it, he was angry with me because I did it. He says further that by my Principles, he that blasphemeth Christ at Constantinople is a true Prophet, as if a man that blasphemeth Christ, to approve his Blasphemy can procure a Miracle; for by my principles no Man is a Prophet whose Prophecie is not confirmed by God with a Miracle. In the last place out of this, That the lawful Sovereign is the Judge of Prophecie, he deduces That then Samuel and other Prophets were false Prophets that contested with their Sovereigns. As for Samuel he was at that time the Judge, that is to say the Sovereign Prince in Israel, and so acknowledged by Saul. For Saul received the Kingdom (from God himself, who had right to give and take it) by the hands of Samuel. And God gave it him to himself only, and not to his Seed; though if he had obeyed God, he would have settled it also upon his Seed. The Commandement of God was, that he should not spare Agag. Saul obeyed not. God therefore sent Samuel to tell him that he was rejected. For all this Samuel went not about to resist Saul. That he caused Agag to be slain, was with Sauls consent. Lastly, Saul confesses his sin. Where is this contesting with Saul? After this God sent Samuel to anoint David, not that he should depose Saul, but succeed him, the Sons of Saul having never had a right of Succession. Nor did ever David make War on Saul, or so much as resist him, but fled from his persecution. But when Saul was dead, then indeed he claimed his right against the House of Saul. What Rebellion or Resistance could his Lordship find here, either

in Samuel or in David? Besides, all these Transactions are supernatural, and oblige not to imitation. Is there any Prophet or Priest now that can set up in England, Scotland or Ireland, another King by pretence of Prophetie or Religion? What did Jeroboam to the man of God (1 Kings 13) that Prophetied against the Altar in Bethel, without first doing a Miracle, but offer to seize him for speaking (as he thought) rashly of the Kings Act; and after the Miraculous withering of his Hand, desire the Prophet to pray for him? The sin of Jeroboam was not his distrust of the Prophet, but his Idolatry. He was the sole Judge of the truth which the man of God uttered against the Altar, and the process agreeable to equity. What is the story of Eliah and Ahab (1 Kings 18.) but a confirmation of the Right, even of Ahab to be the Judge of Prophetie? Eliah told Ahab, he had transgressed the Commandement of God. So may any Minister now tell his Sovereign, so he do it with sincerity and discretion. Ahab told Eliah he troubled Israel. Upon this controversie Eliah desired Tryal. Send, saith he, and Assemble all Israel; Assemble also the Prophets of Baal four hundred and fifty. Ahab did so. The Question is stated before the People thus, If the Lord be God, follow him; but if Baal follow him. Then upon the Altars of God and Baal were laid the Wood and the Bullocks; and the cause was to be Judged by Fire from Heaven, to Burn the Sacrifices; which Eliah procured, the Prophets of Baal could not procure. Was not this cause here Pleaded before Ahab? The Sentence of Ahab is not required; for Eliah from that time forward was no more persecuted by Ahab, but only by his Wife Jezabel. The story of Micaiah (2 Cron. 18.) is this, Ahab King of Israel consulted the Prophets, four hundred in number, whether he should prosper or not, in case he went with Jehosaphat King of Judah to fight against the Syrians at Ramothgilead. The Prophet Micaiah was also called, and both the Kings Ahab and Jehosaphat sat together to hear what they should prophecy. There was no Miracle done. The 400 pronounced Victory, Micaiah alone the

contrary. The King was Judge, and most concern'd in the event; nor had he received any Revelation in the business. What could he do more discreetly than to follow the Counsel of 400 rather than of one Man? But the event was contrary; for he was slain; but not for following the Counsel of the 400, but for his Murder of Naboth and his Idolatry. It was also a sin in him, that he afflicted Micaiah in Prison; but an unjust Judgment does not take away from any King his right of Judicature. Besides, what's all this, or that of Jeremiah, which he cites last, to the Question of who is Judge of Christian Doctrine?

J. D.

Neither doth he use God the Holy Ghost, more favourably than God the Son. Where St. Peter saith, Holy men of God spake as they were moved by the Holy Spirit; He saith, By the Spirit, is meant the Voice of God in a Dream or Vision Supernatural, which Dreams or Visions, he maketh to be no more than imaginations which they had in their sleep, or in an extasie, which in every true Prophet were Supernatural, but in false Prophets were either natural or feigned, and more likely to be false than true. To say God hath spoken to him in a Dream, is no more than to say, he dreamed that God spake to him, &c. To say he hath seen a Vision or heard a Voice, is to say, That he hath dreamed between sleeping and waking. So St. Peter's Holy Ghost is come to be their own imaginations, which might be either feigned, or mistaken, or true. As if the Holy Ghost did enter only at their eyes, and at their ears, not into their understandings, nor into their minds; Or as if the Holy Ghost did not seal unto their hearts the truth and assurance of their Prophesies. Whether a new light be infused into their understandings, or new graces be inspired into their heart, they are wrought, or caused, or created immediately by the Holy Ghost, And so are his imaginations, if they be Supernatural.

T. H.

For the places of my Leviathan he cites, they are all as they stand both true and clearly proved; the setting of them down by Fragments is no Refutation; nor offers he any Argument against them. His consequences are not deduced. I never said that the Holy Ghost was an Imagination, or a Dream, or a Vision, but that the Holy Ghost spake most often in the Scripture by Dreams and Visions supernatural. The next words of his, As if the Holy Ghost did enter only at their eyes, and at their ears, not into their understandings, nor into their minds, I let pass, because I cannot understand them. His last words, Whether new light, &c. I understand and approve.

J. D.

But he must needs fall into these absurdities, who maketh but a jest of inspiration. They who pretend Divine inspiration to be a supernatural entring of the Holy Ghost into a Man, are (as he thinks) in a very dangerous Dilemma; for if they worship not the Men whom they conceive to be inspired, they fall into impiety; and if they worship them, they commit Idolatry. So mistaking the Holy Ghost to be corporeal, some thing that is blown into a Man, and the Graces of the Holy Ghost to be corporeal Graces. And the words, in poured or infused virtue, and, in blown or inspired virtue, are as absurd and insignificant, as a round Quadrangle. He reckons it as a common error, That faith and sanctity are not attained by study and reason, but by supernatural inspiration or infusion. And layeth this for a firm ground; Faith and Sanctity are indeed not very frequent, but yet they are not Miracles, but brought to pass by Education, Discipline, Correction, and other natural wayes. I would see the greatest Pelagian of them all fly higher.

T. H.

I make here no jest of Inspiration. Seriously, I say, that in the proper signification of the words Inspiration and Infusion, to say virtue is inspired, or infused, is as absurd as to say a Quadrangle is round. But Metaphorically, for Gods bestowing of Faith, Grace, or other Vertue, those words are intelligible enough.

J. D.

Why should he trouble himself about the Holy Spirit, who acknowledgeth no Spirit but either a subtil fluid body, or a Ghost, or other Idol or Phantasm of the imagination; who knoweth no inward Grace or intrinsecal Holyness? Holy is a word which in Gods Kingdom answereth to that which men in their Kingdoms use to call publick, or the Kings. And again, wheresoever the word Holy is taken properly, there is still some thing signified of propriety gotten by consent. His Holiness is a Relation, not a Quality; for inward sanctification, or real infused holiness, in respect whereof the third Person is called the Holy Ghost, because he is not only holy in himself, but also maketh us holy, he is so great a stranger to it, that he doth altogether deny it, and disclaim it.

T. H.

The word Holy I had defined in the words which his Lordship here sets down, and by the use thereof in the Scripture made it manifest, That that was the true signification of the word. There is nothing in Learning more difficult than to determine the signification of words. That difficulty excuses him. He says that Holiness (in my sence) is a Relation, not a Quality. All the Learned agree that Quality is an Accident, so that in attributing to God Holiness (as a Quality) he contradicts himself; for he has in the beginning of this his discourse denyed (and rightly) that any Accident is in God, saying whatsoever is in God is the Divine Substance. He affirms also, that to attribute any Accident to God, is to deny the simplicity of the

Divine Substance. And thus his Lordship makes God, as I do, a Corporeal Spirit. Both here, and throughout, he discovers so much ignorance, as had he charged me with error only, and not with Atheism, I should not have thought it necessary to answer him.

J. D.

We are taught in our Creed to believe the Catholick or Universal Church. But T. H. teacheth us the contrary, That if there be more Christian Churches than one, all of them together are not one Church personally. And more plainly, Now if the whole number of Christians be not contained in one Common-wealth, they are not one Person, nor is there an Vniversal Church, that hath any Authority over them. And again, The Vniversal Church is not one Person, of which it can be said, that it hath done, or Decreed, or Ordained, or Excommunicated, or Absolved. This doth quite overthrow all the Authority of General Councils.

All other Men distinguish between the Church and the Common-wealth; only T. H. maketh them to be one and the same thing. The Common-wealth of Christian men, and the Church of the same, are altogether the same thing, called by two names, for two reasons. For the matter of the Church and of the Common-wealth is the same, namely the same Christian men; and the Form is the same, which consisteth in the lawful power of convocating them. And hence he concludeth, That every Christian Common-wealth is a Church endowed with all spiritual Authority. And yet more fully, The Church if it be one Person, is the same thing with the Common-wealth of Christians, called a Common-wealth, because it consisteth of men united in one Person their Sovereign; And a Church because it consisteth in Christian men united in one Christian Sovereign. Upon which account there was no

Christian Church in these Parts of the World, for some hundreds of years after Christ, because there was no Christian Sovereign.

T. A.

For answer to this Period, I say only this, That taking the Church (as I do in all those places) for a company of Christian men on Earth incorporated into one Person, that can speak, command, or do any act of a Person, all that he citeth out of what I have written is true; and that all private Conventicles, though their belief be right, are not properly called Churches; and that there is not any one Universal Church here on Earth which is a Person indued with Authority universal to govern all Christian men on Earth, no more than there is one Universal Sovereign Prince or State on Earth that hath right to govern all Mankind. I deny also that the whole Clergy of a Christian Kingdom or State being assembled, are the representative of that Church further than the Civil Laws permits; or can lawfully assemble themselves, unless by the command or by the leave of the Sovereign Civil Power. I say further, that the denial of this point tendeth in England towards the taking away of the Kings Supremacy in causes Ecclesiastical. But his Lordship has not here denied any thing of mine, because he has done no more but set down my words. He says further, that this Doctrine destroyes the Authority of all General Councils; which I confess. Nor hath any General Council at this day in this Kingdom the force of a Law, nor ever had, but by the Authority of the King.

J. D.

Neither is he more Orthodox concerning the Holy Scriptures, Hitherto, that is, for the Books of Moses, the power of making the Scripture Canonical, was in the Civil Sovereign. The like he saith of the Old Testament, made Canonical by Esdras. And of the New Testament, That it was not the Apostles which made their own Writings Canonical, but every

Convert made them so to himself. Yet with this restriction, That until the Sovereign Ruler had prescribed them, they were but Counsel and Advice, which whether good or bad, he that was counselled might without injustice refuse to observe, and being contrary to the Laws established, could not without injustice observe. He maketh the Primitive Christians to have been in a pretty condition. Certainly the Gospel was contrary to the Laws then established. But most plainly, The word of the Interpreter of the Scripture is the word of God. And the same is the Interpreter of the Scripture, and the Sovereign Judge of all Doctrines, that is, the Sovereign Magistrate, to whose Authority we must stand no less, than to theirs, who at first did commend the Scripture to us for the Canon of Faith. Thus if Christian Sovereigns, of different Communications, do clash one with another, in their interpretations, or misinterpretation of Scripture (as they do daily) then the word of God is contradictory to it self; or that is the word of God in one Common-wealth, which is the word of the Devil in another Common-wealth. And the same thing may be true, and not true at the same time: Which is the peculiar priviledge of T.H. to make Contradictories to be true together.

T. H.

There is no doubt but by what Authority the Scripture or any other Writing is made a Law, by the same Authority the Scriptures are to be interpreted, or else they are made Law in vain. But to obey is one thing, to believe is another; which distinction perhaps his Lordship never heard of. To obey is to do or forbear as one is commanded, and depends on the Will; but to believe depends not on the Will, but on the providence and guidance of our hearts that are in the hands of God Almighty. Laws only required obedience; Belief requires Teachers and Arguments drawn either from Reason, or from some thing already believed. Where there is no reason for our Belief, there is no reason we should believe. The reason why men

believe, is drawn from the Authority of those men whom we have no just cause to mistrust, that is, of such men to whom no profit accrues by their deceiving us, and of such men as never used to lye, or else from the Authority of such men whose Promises, Threats, and Affirmations we have seen confirmed by God with Miracles. If it be not from the Kings Authority that the Scripture is Law, what other Authority makes it Law? Here some man being of his Lordships judgment will perhaps laugh and say, 'tis the Authority of God that makes them Law. I grant that. But my question is, on what Authority they believe that God is the Author of them? Here his Lordship would have been at a Nonplus, and turning round, would have said the Authority of the Scripture makes good that God is their Author. If it be said we are to believe the Scripture upon the Authority of the Universal Church, why are not the Books we call Apocrypha the Word of God as well as the rest? If this Authority be in the Church of England, then it is not any other than the Authority of the Head of the Church, which is the King. For without the Head the Church is mute, the Authority therefore is in the King; which is all that I contended for in this point. As to the Laws of the Gentiles, concerning Religion in the Primitive times of the Church, I confess they were contrary to Christian Faith. But none of their Laws, nor Terrors, nor a mans own Will are able to take away Faith, though they can compel to an external obedience; and though I may blame the Ethnick Princes for compelling men to speak what they thought not, yet I absolve not all those that have had the Power in Christian Churches from the same fault. For I believe since the time of the first four General Councils, there have been more Christians burnt and killed in the Christian Church by Ecclesiastical Authority, than by the Heathen Emperors Laws for Religion only without Sedition. All that the Bishop does in this Argument is but a heaving at the Kings Supremacy. Oh, but (says he) if two Kings interpret a place of Scripture in contrary sences, it will follow that both sences are true.

It does not follow. For the interpretation, though it be made by just Authority, must not therefore always be true. If the Doctrine in the one sence be necessary to Salvation, then they that hold the other must dye in their sins, and be Damned. But if the Doctrine in neither sence be necessary to Salvation, then all is well, except perhaps that they will call one another Atheists, and fight about it.

J. D.

All the power, vertue, use and efficacy, which he ascribeth to the Holy Sacraments, is to be signs or commemorations. As for any sealing, or confirming, or conferring of Grace, he acknowledgeth nothing. The same he saith particularly of Baptism: Upon which grounds a Cardinals red Hat, or a Serjeant at Arms his Mace, may be called Sacraments as well as Baptism, or the holy Eucharist, if they be only signs and commemorations of a benefit. If he except, that Baptism and the Eucharist, are of Divine institution: But a Cardinals red Hat or a Serjeant at Arms his Mace are not: He saith truly but nothing to his advantage or purpose, seeing he deriveth all the Authority of the Word and Sacraments, in respect of Subjects, and all our obligation to them, from the Authority of the Sovereign Magistrate, without which these words repent, and be Baptized in the name of Jesus, are but Counsel, no Command. And so a Serjeant at Arms his Mace, and Baptism, proceed both from the same Authority. And this he saith upon this silly ground, That nothing is a Command, the performance whereof tendeth to our own benefit. He might as well deny the Ten Commandments to be Commands, because they have an advantagious promise annexed to them, Do this and thou shalt live; And Cursed is every one that continueth not in all the words of this Law to do them.

T. H.

Of the Sacraments I said no more, than that they are Signs or Commemorations. He finds fault that I add not Seals, Confirmations, and that they confer grace. First, I would have asked him if a Seal be any thing else besides a Sign, whereby to remember somewhat, as that we have promised, accepted, acknowledged, given, undertaken somewhat. Are not other Signs though without a Seal, of force sufficient to convince me or oblige me? A Writing obligatory, or Release signed only with a mans name is as Obligatory as a Bond signed and sealed, if it be sufficiently proved, though peradventure it may require a longer Process to obtain a Sentence, but his Lordship I think knew better than I do the force of Bonds and Bills; yet I know this that in the Court of Heaven there is no such difference between saying, signing, and sealing, as his Lordship seemeth here to pretend. I am Baptized for a Commemoration that I have enrolled my self. I take the Sacrament of the Lords Supper to Commemorate that Christ's Body was broken, and his Blood shed for my redemption. What is there more intimated concerning the nature of these Sacraments, either in the Scripture or in the Book of Common-Prayer? Have Bread and Wine and Water in their own Nature, any other Quality than they had before the Consecration? It is true that the Consecration gives these bodies a new Relation, as being a giving and dedicating of them to God, that is to say a making of them Holy, not a changing of their Quality. But as some silly young men returning from France affect a broken English, to be thought perfect in the French language; so his Lordship (I think) to seem a perfect understander of the unintelligible language of the Schoolmen, pretends an ignorance of his Mother Tongue. He talks here of Command and Counsel as if he were no English man, nor knew any difference between their significations. What English man when he commandeth, says more than, Do this; yet he looks to be obeyed, if obedience be due unto him. But when he says, Do this, and thou shalt have such or such a Reward, he encourages

him, or advises him, or Bargains with him, but Commands him not. Oh, the understanding of a Schoolman.

J. D.

Sometimes he is for holy Orders, and giveth to the Pastors of the Church the right of Ordination and Absolution, and Infallibility, too much for a particular Pastor, or the Pastors of one particular Church. It is manifest, that the consecration of the chiefest Doctors in every Church, and imposition of hands, doth pertain to the Doctors of the same Church. And it cannot be doubted of, but the power of binding and loosing was given by Christ to the future Pastors, after the same manner as to his present Apostles. And our Saviour hath promised this infallibility in those things which are necessary to Salvation, to his Apostles, until the day of Judgment, that is to say, to the Apostles and Pastors, to be Consecrated by the Apostles successively, by the imposition of hands.

But at other times he casteth all this Meal down with his foot. Christian Sovereigns are the supream Pastors, and the only persons whom Christians now hear speak from God, except such as God speaketh to in these dayes supernaturally. What is now become of the promised infallibility?

And it is from the Civil Sovereign that all other Pastors derive their right of teaching, preaching, and all other functions pertaining to that Office, and they are but his Ministers in the same manner as the Magistrates of Towns, or Judges in Courts of Justice, and Commanders of Armies. What is now become of their Ordination? Magistrates, Judges, and Generals, need no precedent qualifications. He maketh the Pastoral Authority of Sovereigns to be *Jure divino*, of all other Pastors *Jure civili*: He addeth, neither is there any Judge of Heresie among Subjects, but their own civil Sovereign.

Lastly, the Church Excommunicateth no man but whom she Excommunicateth by the Authority of the Prince. And the effect of Excommunication hath nothing in it, neither of dammage in this World, nor

terror upon an Apostate, if the Civil Power did persecute or not assist the Church. And in the World to come, leaves them in no worse estate, than those who never believed. The damage rather redoundeth to the Church. Neither is the Excommunication of a Christian Subject, that obeyeth the Laws of his own Sovereign, of any effect. Where is now their power of binding and loosing?

T. H.

Here his Lordship condemneth, first my too much kindness to the Pastors of the Church; as if I ascribed Infallibility to every particular Minister, or at least to the Assembly of the Pastors of a particular Church. But he mistakes me, I never meant to flatter them so much. I say only that the Ceremony of Consecration, and Imposition of hands belongs to them; and that also no otherwise than as given them by the Laws of the Commonwealth. The Bishop Consecrates, but the King both makes him Bishop and gives him his Authority. The Head of the Church not only gives the power of Consecration, Dedication, and Benediction, but may also exercise the Act himself if he please. Solomon did it, and the Book of Canons says, That the King of England has all the Right that any good King of Israel had. It might have added that any other King or sovereign Assembly had in their own Dominions. I deny That any Pastor or any Assembly of Pastors in any particular Church, or all the Churches on earth though united are Infallible. Yet I say the Pastors of a Christian Church assembled are in all such points as are necessary to Salvation. But about what points are necessary to Salvation he and I differ. For I in the 43d chapter of my Leviathan have proved that this Article, Jesus is the Christ, is the unum necessarium, the only Article necessary to Salvation; to which his Lordship hath not offered any Objection. And he (it seems) would have necessary to Salvation every Doctrine he himself thought so. Doubtless in this Article, Jesus is the Christ, every Church is infallible; for else it were no Church. Then he says,

I overthrow this again by saying that Christian Sovereigns are the Supream Pastors, that is, Heads of their own Churches; That they have their Authority Jure Divino; That all other Pastors have it Jure Civili: How came any Bishop to have Authority over me, but by Letters Patents from the King? I remember a Parliament wherein a Bishop, who was both a good Preacher and a good Man, was blamed for a Book he had a little before Published in maintenance of the Jus Divinum of Bishops; a thing which before the Reformation here, was never allowed them by the Pope. Two Jus Divinums cannot stand together in one Kingdom. In the last place he mislikes that the Church should Excommunicate by Authority of the King, that is to say, by Authority of the Head of the Church. But he tells not why. He might as well dislike that the Magistrates of the Realm should execute their Offices by the Authority of the Head of the Realm. His Lordship was in a great error, if he thought such incroachments would add any thing to the Wealth, Dignity, Reverence or Continuance of his Order. They are Pastors of Pastors, but yet they are the Sheep of him that is on earth their sovereign Pastor, and he again a Sheep of that supream Pastor which is in Heaven. And if they did their pastoral Office, both by Life and Doctrine, as they ought to do, there could never arise any dangerous Rebellion in the Land. But if the people see once any ambition in their Teachers, they will sooner learn that, than any other Doctrine; and from Ambition proceeds Rebellion.

J. D.

It may be some of T. H. his Disciples desire to know what hopes of Heavenly joyes they have upon their Masters Principles. They may hear them without any great contentment, There is no mention in Scripture, nor ground in reason, of the Coelum Empyraeum, that is, the Heaven of the Blessed, where the Saints shall live eternally with God. And again, I have not found any Text that can probably be drawn to prove any Ascention of

the Saints into Heaven, that is to say, into any Coelum Empyraeum. But he concludeth positively, that Salvation shall be upon earth, when God shall Raign at the coming of Christ in Jerusalem. And again, In short, the Kingdom of God is a civil Kingdom, &c. called also the Kingdom of Heaven, and the Kingdom of Glory. All the Hobbians can hope for, is, to be restored to the same condition which Adam was in before his fall. So saith T.H. himself, From whence may be inferred, that the Elect, after the Resurrection, shall be restored to the estate wherein Adam was before he had sinned. As for the beatifical vision he defineth it to be a word unintelligible.

T. H.

This Coelum Empyraeum for which he pretendeth so much zeal, where is it in the Scripture, where in the Book of Common Prayer, where in the Canons, where in the Homilies of the Church of England, or in any part of our Religion? What has a Christian to do with such Language? Nor do I remember it in Aristotle. Perhaps it may be in some Schoolman or Commentator on Aristotle, and his Lordship makes it in English the Heaven of the Blessed, as if Empyraeum signified That which belongs to the Blessed. St. Austin says better; that after the day of Judgment all that is not Heaven shall be Hell. Then for Beatifical vision, how can any man understand it that knows from the Scripture that no man ever saw or can see God. Perhaps his Lordship thinks that the happiness of the Life to come is not real but a Vision. As for that which I say (Lev. pag. 345.) I have answered to it already.

J. D.

But considering his other Principles, I do not marvel much at his extravagance in this point. To what purpose should a Coelum Empyraeum, or Heaven of the Blessed, serve in his judgment, who maketh the blessed

Angels that are the Inhabitants of that happy Mansion, to be either Idols of the brain, that is in plain English, nothing, or thin, subtil, fluid bodies, destroying the Angelical nature. The universe being the aggregate of all bodies, there is no real part thereof that is not also body. And elsewhere, Every part of the Vniverse is Body, and that which is not Body, is no part of the Vniverse. And because the Vniverse is all, that which is no part of it is nothing, and consequently no where. How? By this Doctrine he maketh not only the Angels, but God himself to be nothing. Neither doth he salve it at all, by supposing erroneously Angels to be corporeal Spirits, and by attributing the name of incorporeal Spirit to God, as being a name of more honour, in whom we consider not what Attribute best expresseth his nature, which is incomprehensible, but what best expresseth our desire to honour him. Though we be not able to comprehend perfectly what God is, yet we are able perfectly to comprehend what God is not, that is, he is not imperfect, and therefore he is not finite, and consequently he is not corporeal. This were a trim way to honour God indeed to honour him with a lye. If this that he say here be true, That every part of the Vniverse is a Body; and whatsoever is not a Body is nothing. Then by this Doctrine, if God be not a Body, God is nothing; not an incorporeal Spirit, but one of the Idols of the Brain, a meer nothing, though they think they dance under a Net, and have the blind of Gods incomprehensibility, between them and discovery.

T. H.

This of Incorporeal substance he urged before, and there I answered it. I wonder he so often rolls the same stone. He is like Sysiphus in the Poets Hell, that there rolls a heavy stone up a hill, which no sooner he brings to day-light, then it slips down again to the bottom, and serves him so perpetually. For so his Lordship rolls this and other questions with much

adue till they come to the light of Scripture; and then they vanish, and he vexing, sweating, and railing goes to't again, to as little purpose as before. From that I say of the Universe he infers, that I make God to be nothing. But infers it absurdly. He might indeed have inferr'd that I make him a Corporeal, but yet a pure Spirit. I mean by the Universe, the Aggregate of all things that have being in themselves, and so do all men else. And because God has a being, it follows that he is either the whole Universe, or part of it. Nor does his Lordship go about to disprove it, but only seems to wonder at it.

J. D.

To what purpose should a Coelum Empyraeum serve in his Judgment, who denyeth the immortality of the Soul? The Doctrine is now, and hath been a long time far otherwise; namely, that every man hath eternity of life by nature, in as much as his Soul is immortal. Who supposeth that when a man dyeth, there remaineth nothing of him but his Carkase; who maketh the word Soul in holy Scripture to signifie always either the Life, or the Living Creature? And expoundeth the casting of Body and Soul into Hell-fire, to be the casting of Body and Life into Hell-fire. Who maketh this Orthodox truth, that the Souls of men are Substances distinct from their Bodies, to be an error contracted by the contagion of the Demonology of the Greeks, and a window that gives entrance to the dark Doctrine of eternal torments. Who expoundeth these words of Solomon, [Then shall the dust return to the earth as it was, and the Spirit shall return to God that gave it,] Thus, God only knows what becomes of a mans Spirit, when he exspireth. He will not acknowledge that there is a Spirit, or any Substance distinct from the Body. I wonder what they think doth keep their Bodies from stinking.

T. H.

He comes here to that which is a great Paradox in School Divinity. The grounds of my opinion are the Canonical Scripture, and the Texts which I cited I must again recite, to which I shall also add some others. My Doctrine is this, First, That the elect in Christ from the day of Judgment forward, by vertue of Christ's Passion and Victory over death, shall enjoy eternal life, that is, they shall be Immortal. Secondly, that there is no living Soul separated in place from the Body, more than there is a living Body separated from the Soul. Thirdly, That the reprobate shall be revived to Judgment, and shall dye a second death in Torments, which death shall be everlasting. Now let us consider what is said to these points in the Scripture, and what is the harmony therein of the Old and New Testament.

And first, because the word Immortal Soul, is not found in the Scriptures, the question is to be decided by evident consequences from the Scripture. The Scripture saith of God expresly (1 Tim. 6.16.) That He only hath immortality, and dwelleth in inaccessible light. Hence it followeth that the Soul of man is not of its own nature Immortal, but by Grace, that is to say, by the gift of God. And then the question will be whether this grace or gift of God were bestowed on the Soul in the Creation and Conception of the Man, or afterwards by his redemption. Another question will be in what sence immortality of Torments can be called a gift, when all gifts suppose the thing given to be grateful to the receiver. To the first of these, Christ himself saith (Luke 14.13, 14.) When thou makest a Feast, call the Poor, the Maimed, the Lame, the Blind, and thou shalt be Blessed, for they cannot recompense thee; For thou shalt be recompensed at the resurrection of them that be just. It follows hence that the reward of the Elect is not before the Resurrection. What reward then enjoys a separated Soul in Heaven, or any where else till that day come, or what has he to do there till the Body rise again? Again St. Paul says (Rom. 2.6, 7.) God will render to every man according to his works. To them who by patient continuance in well doing,

seek for Honour, Glory and Immortality, Eternal Life. But unto them that be contentious, and do not obey the truth, but obey unrighteousness, indignation and wrath. Here it is plain that God gives Eternal Life only to well doers, and to them that seek (not to them that have already) Immortality. Again (1 Tim. 1.10.) Christ hath abolished Death, and brought Life and Immortality to light, through the Gospel. Therefore before the Gospel of Christ, nothing was Immortal but God. And St. Paul speaking of the day of Judgment (1 Cor. 15.54.) saith that This Mortal shall put on Immortality, and that then Death is swallowed in Victory. There was no Immortality of any thing Mortal till Death was overcome, and that was at the Resurrection. And John 8.52. Verily, Verily, if a man keep my sayings he shall never see Death, that is to say, he shall be Immortal; but it is nowhere said, that he which keeps not Christ's sayings shall never see Death, nor be Immortal, and yet they that say that the wicked, Body and Soul, shall be tormented everlastingly, do therein say they are Immortal. Mat. 10.28. Fear not them that can kill the Body, but are not able to kill the Soul; but fear him that is able to destroy both Soul and Body in Hell. Man cannot kill a Soul, for the Man kill'd shall revive again. But God can destroy the Soul and Body in Hell, as that it shall never return to life. In the Old Testament we read (Gen. 7.4.) I will destroy every living Substance that I have made from off the face of the Earth; therefore, if the Souls of them that perished in the Flood were Substances, they were also destroyed in the Flood and were not Immortal. (Math. 25.41.) Depart from me ye cursed into everlasting Fire, prepared for the Devil and his Angels. These words are to be spoken in the day of Judgment, which Judgment is to be in the Clouds. And there shall stand the men that are reprobated alive, where Souls according to his Lordships Doctrine were sent long before to Hell. Therefore at that present day of Judgment they had one Soul by which they were there alive, and another Soul in Hell. How his Lordship could have

maintained this, I understand not. But by my Doctrine, that the Soul is not a separated Substance, but that the Man at his Resurrection shall be revived by God, and raised to Judgment, and afterwards Body and Soul destroyed in Hell-fire (which is the second death) there is no such consequence or difficulty to be inferred. Besides it avoids the unnecessary disputes about where the Soul of Lazarus was for four dayes he lay dead. And the order of the Divine Process is made good, of not inflicting torments before the Condemnation pronounced.

Now as to the harmony of the two Testaments, it is said in the old (Gen. 2.17.) In the day that thou eatest of the Tree of Knowledge, dying thou shalt dye. *Moriendo morieris*, that is, when thou art dead thou shalt not revive; for so hath Athanasius expounded it. Therefore Adam and Eve were not Immortal by their Creation. Then (Gen. 3.22.) Behold the man is become as one of us — Now lest he put forth his hand and take also of the Tree of Life, and eat, and live for ever, &c. Here they had had an Immortality by the gift of God, if they had not sinned. It was therefore sin that lost them Eternal-life. He therefore that redeemed them from sin was the Author of their Immortality, and consequently began in the day of Judgment when Adam and Eve were again made alive by admission to the new Tree of Life, which was Christ.

Now let us compare this with the New Testament. Where we find these words (1 Cor. 15.21.) since by Man came Death, by Man came also the Resurrection of the dead. Therefore all the Immortality of the Soul, that shall be after the Resurrection, is by Christ, and not by the nature of the Soul. verse 22. As by Adam all dye, even so in Christ shall all be made alive. Therefore since we dyed by Adam's sin, so we shall live by Christ's Redemption of us, that is, after the Resurrection. Again verse 23. But every man in his order; Christ the first Fruits, afterwards they that are Christs, at his coming. Therefore none shall be made alive till the coming of Christ.

Lastly, as when God had said, That day that thou eatest of the Tree of Knowledg of Good and Evil, thou shalt dye, though he condemned him then, yet he suffered him to live a long time after; so when Christ had said to the Thief on the Cross, this day thou shalt be with me in Paradise, yet he suffered him to lye dead till the General Resurrection, for no man rose again from the dead before our Saviours coming, and conquering death.

If God bestowed Immortality on every man then when he made him, and he made many to whom he never purposed to give his saving Grace, what did his Lordship think that God gave any man Immortality with purpose only to make him capable of Immortal Torments? 'Tis a hard saying, and I think cannot piously be believed. I am sure it can never be proved by the Canonical Scripture.

But though I have made it clear that it cannot be drawn by lawful consequence from Scripture, that Man was Created with a Soul Immortal, and that the Elect only, by the Grace of God in Christ, shall both Bodies and Souls from the Resurrection forward be Immortal; yet there may be a Consequence well drawn from some words in the Rites of Burial, that prove the contrary, as these. Forasmuch as it hath pleased Almighty God of his great mercy, to take unto himself the Soul of our dear Brother here departed, &c. And these, Almighty God, with whom do live the Spirits of them that depart hence in the Lord. Which are words Authorised by the Church. I wonder his Lordship that had so often pronounced them, took no notice of them here. But it often happens that men think of those things least, which they have most perfectly learnt by rote. I am sorry I could not without deserting the sence of Scripture and mine own Conscience say the same. But I see no just cause yet why the Church should be offended at it. For the Church of England pretendeth not (as doth the Church of Rome) to be above the Scripture; nor forbiddeth any man to Read the Scripture; nor was I forbidden when I Wrote my Leviathan to Publish any thing which the

Scriptures suggested. For when I Wrote it, I may safely say there was no lawful Church in England, that could have maintained me in, or prohibited me from Writing any thing. There was no Bishop, and though there were Preaching, such as it was, yet no Common-Prayer. For Extemporary Prayer, though made in the Pulpit, is not Common-Prayer. There was then no Church in England that any man living was bound to obey. What I Write here at this present time I am forced to in my defence, not against the Church, but against the accusations and arguments of my Adversaries. For the Church, though it excommunicates for scandalous life, and for teaching false Doctrines, yet it professeth to impose nothing to be held as Faith, but what may be warranted by Scripture, and this the Church it self saith in the 20th of the 39 Articles of Religion. And therefore I am permitted to alledge Scripture at any time in the defence of my Belief.

J. D.

But they that in one case are grieved, in another must be relieved. If perchance T. H. hath given his Disciples any discontent in his Doctrine of Heaven and the holy Angels, and the glorified Souls of the Saints, he will make them amends in his Doctrine of Hell, and the Devils, and the damned Spirits. First of the Devils; He fancieth that all those Devils which our Saviour did cast out, were Phrensies, and all Demoniacs (or Persons possessed) no other than Mad-men. And to justifie our Saviour's speaking to a Disease as to a Person, produceth the example of inchanters. But he declareth himself most clearly upon this Subject, in his Animadversions upon my reply to his defence of fatal destiny. There are in the Scripture two sorts of things which are in English translated Devils. One is that which is called Satan, Diabolus, Abaddon, which signifieth in English an Enemy, an Accuser, and a destroyer of the Church of God, in which sence the Devils are but wicked men. The other sort of Devils are called in the Scripture Daemonia, which are the feigned Gods of the Heathen, and are neither

Bodies nor spiritual Substances, but meer fancies, and fictions of terrified hearts, feigned by the Greeks, and other Heathen People, which St. Paul calleth Nothings. So T.H. hath killed the great infernal Devil, and all his black Angels, and left no Devils to be feared, but Devils Incarnate, that is, wicked men.

T. H.

As for the first words cited (Levi. page 38, 39.) I refer the Reader to the place it self; and for the words concerning Satan, I leave them to the judgment of the Learned.

J. D.

And for Hell he describeth the Kingdom of Satan, or the Kingdom of darkness, to be a confederacy of deceivers. He telleth us that the places which set forth the torments of Hell in holy Scripture, do design Metaphorically a grief and discontent of mind, from the sight of that eternal felicity in others, which they themselves, through their own incredulity and disobedience have lost. As if Metaphorical descriptions did not bear sad truths in them, as well as literal, as if final desperation were no more than a little fit of grief or discontent; and a guilty conscience were no more than a transitory passion, as if it were a loss so easily to be born, to be deprived for evermore of the beatifical Vision: and lastly as if the Damned, besides that unspeakable loss, did not likewise suffer actual Torments, proportionable in some measure to their own sins, and Gods Justice.

T. H.

That Metaphors bear sad truths in them, I deny not. It is a sad thing to lose this present life untimely. Is it not therefore much more a sad thing to lose an eternal happy Life? And I believe that he which will venture upon

sin, with such danger, will not stick to do the same notwithstanding the Doctrine of eternal torture. Is it not also a sad truth, that the Kingdom of darkness should be a Confederacy of deceivers?

J. D.

Lastly, for the damned Spirits, he declareth himself every where, that their sufferings are not eternal. The Fire shall be unquenchable, and the Torments everlasting; but it cannot be thence inferred, that he who shall be cast into that Fire, or be tormented with those Torments, shall endure and resist them, so as to be eternally burnt and tortured, and yet never be destroyed nor dye. And though there be many places, that affirm everlasting fire, into which men may be cast successively one after another for ever; yet I find none that affirm that there shall be an everlasting life therein of any individual Person. If he had said, and said only, that the pains of the Damned may be lessened, as to the degree of them, or that they endure not for ever, but that after they are purged by long torments from their dross and Corruptions, as Gold in the fire, both the damned Spirits and the Devils themselves should be restored to a better condition, he might have found some Ancients (who are therefore called the merciful Doctors) to have joyned with him, though still he should have wanted the suffrage of the Catholick Church.

T. H.

Why does not his Lordship cite some place of Scripture here to prove that all the Reprobates which are dead, live eternally in torment? We read indeed That everlasting Torments were prepared for the Devil and his Angels, whose natures also are everlasting; and that the Beast and the false Prophet shall be tormented everlastingly; but not that every Reprobate shall be so. They shall indeed be cast into the same fire, but the Scripture says plainly enough, that they shall be both Body and Soul destroyed there. If I

had said that the Devils themselves should be restored to a better condition; his Lordship would have been so kind as to have put me into the number of the Merciful Doctors. Truly if I had had any Warrant for the possibility of their being less enemies to the Church of God than they have been, I would have been as merciful to them as any Doctor of them all. As it is, I am more merciful than the Bishop.

J. D.

But his shooting is not at rovers, but altogether at randome, without either President or Partner. All that eternal fire, all those torments which he acknowledgeth, is but this, That after the Resurrection, the Reprobate shall be in the estate that Adam and his Posterity were in, after the sin committed, saving that God promised a Redeemer to Adam and not to them. Adding, that they shall live as they did formerly, Marry, and give in Marriage; and consequently engender Children perpetually after the Resurrection, as they did before, which he calleth an immortallity of the kind, but not of the persons of men. It is to be presumed, that in those their second lives, knowing certainly from T. H. that there is no hope of Redemption for them from corporal death upon their well-doing; nor fear of any Torments after death for their ill-doing, they will pass their times here as pleasantly as they can. This is all the Damnation which T. H. fancieth.

T. H.

This he has urged once before, and I answered to it, That the whole Paragraph was to prove, that for any Text of Scripture to the contrary, men might, after the Resurrection live as Adam did on earth, and that notwithstanding the Text of St. Luke cha. verse 34, 35, 36. Marry and propagate. But that they shall do so, is no assertion of mine. His Lordship knew I held that after the Resurrection there shall be at all no wicked men;

but the Elect (all that are, have been, and hereafter shall be) shall live on earth. But St. Peter says, there shall then be a new Heaven and a new Earth.

J. D.

In summ I leave it to the free judgment of the understanding Reader, by these few instances which follow, to judge what the Hobbian Principles are in point of Religion. *Ex ungue leonem*.

First, that no man needs to put himself to any hazzard for his Faith, but may safely comply with the times. And for their Faith it is internal and invisible. They have the licence that Naaman had, and need not put themselves into danger for it.

Secondly, he alloweth Subjects, being commanded by their Sovereign, to deny Christ. Profession with the Tongue is but an external thing, and no more than any other gesture, whereby we signifie our obedience. And wherein a Christian, holding firmly in his heart the Faith of Christ, hath the same liberty which the Prophet Elisha allowed to Naaman, &c. Who by bowing before the Idol Rimmon, denyed the true God as much in effect, as if he had done it with his Lips. Alas, why did St. Peter Weep so bitterly for denying his Master, out of fear of his Life or Members? It seems he was not acquainted with these Hobbian Principles. And in the same place he layeth down this general Conclusion. This we may say that whatsoever a Subject is compelled to, in obedience to his Sovereign, and doth it not in order to his own mind, but in order to the Laws of his Country, that action is not his, but his Sovereign's; nor is it he that in this case denyeth Christ before men, but his Governor and the Law of his Country. His instance in a Mahometan commanded by a Christian Prince to be present at Divine Service, is a weak mistake, springing from his gross ignorance in Case-Divinity, not knowing to distinguish between an erroneous Conscience, as the Mahometans is, and a Conscience rightly informed.

T. H.

In these his two first instances I confess his Lordship does not much belie me. But neither does he confute me. Also I confess my ignorance in his Case-Divinity which is grounded upon the Doctrine of the School-men. Who to decide Cases of Conscience, take in, not only the Scriptures, but also the Decrees of the Popes of Rome, for the advancing of the Dominion of the Roman Church over Consciences; whereas the true decision of Cases of Consciences ought to be grounded only on Scripture, or natural Equity. I never allowed the denying of Christ with the Tongue in all men, but expressly say the contrary (Lev. pag. 362.) in these words, For an unlearned man that is in the power of an Idolatrous King or State, if commanded on pain of death to worship before an Idol, he detesteth the Idol in his heart; he doth well, though if he had the fortitude to suffer death rather than worship it, he should do better. But if a Pastor who as Christ's messenger has undertaken to teach Christ's Doctrine to all Nations, should do the same, it were not only a sinful scandal in respect of other Christian mens Consciences, but a perfidious forsaking of his charge. Therefore St. Peter in denying Christ sinned, as being an Apostle. And 'tis sin in every man that should now take upon him to preach against the power of the Pope, to leave his Commission unexecuted for fear of the fire; but in a meer Traveller, not so. The three Children and Daniel were worthy Champions of the true Religion. But God requireth not of every man to be a Champion. As for his Lordship's words of complying with the times, they are not mine, but his own spiteful Paraphrase.

J. D.

Thirdly, if this be not enough, he giveth licence to a Christian to commit Idolatry, or at least to do an Idolatrous act, for fear of death or corporal danger. To pray unto a King voluntarily for fair weather, or for any thing

which God only can do for us, is divine Worship, and Idolatry. On the other side, if a King compel a man to it by the terror of death, or other great corporal punishment, it is not Idolatry. His reason is, because it is not a sign, that he doth inwardly honour him as a God, but that he is desirous to save himself from death, or from a miserable life. It seemeth T. H. thinketh there is no divine Worship, but internal. And that it is lawful for a man to value his own life or his limbs more than his God. How much is he wiser than the three Children, or Daniel himself? who were thrown, the first into a fiery Furnace, the last into the Lions Denn, because they refused to comply with the Idolatrous Decree of their Sovereign Prince.

T. H.

Here also my words are truly cited. But his Lordship understood not what the word Worship signifies; and yet he knew what I meant by it. To think highly of God (as I had defined it) is to honour him. But to think is internal. To Worship, is to signifie that Honour which we inwardly give, by signs external. This understood (as by his Lordship it was) all he says to it is but a cavil.

J. D.

A fourth Aphorism may be this, That which is said in the Scripture, it is better to obey God than man, hath place in the Kingdom of God by Pact, and not by Nature. Why? Nature it self doth teach us it is better to obey God than men. Neither can he say that he intended this only of obedience, in the use of indifferent actions and gestures, in the service of God, commanded by the Common-wealth, for that is to obey both God and man. But if divine Law and humane Law clash one with another, without doubt it is evermore better to obey God than man.

T. H.

Here again appears his unskilfulness in reasoning. Who denyes, but it is alwayes, and in all causes better to obey God than Man? But there is no Law, neither divine nor humane that ought to be taken for a Law, till we know what it is, and if a divine Law, till we know that God hath commanded it to be kept. We agree that the Scriptures are the Word of God. But they are a Law by Pact, that is, to us who have been Baptized into the Covenant. To all others it is an invitation only to their own benefit. 'Tis true that even nature suggesteth to us that the Law of God is to be obeyed rather than the Law of man. But nature does not suggest to us that the Scripture is the Law of God, much less how every Text of it ought to be interpreted. But who then shall suggest this? Dr. Bramhall? I deny it. Who then? The stream of Divines? Why so? Am I that have the Scripture it self before my eyes, obliged to venture my eternal life upon their interpretation, how learned soever they pretend to be, when no counter-security that they can give me, will save me harmless? If not the stream of Divines, who then? The lawful Assembly of Pastors or of Bishops? But there can be no lawful Assembly in England without the Authority of the King. The Scripture therefore what it is, and how to be interpreted, is made known unto us here, by no other way than the Authority of our Sovereign Lord both in Temporals and Spiritualls, The Kings Majesty. And where he has set forth no Interpretation, there I am allowed to follow my own, as well as any other man, Bishop or not Bishop. For my own part, all that know me, know also it is my opinion, That the best government in Religion is by Episcopacy, but in the King's Right, not in their own. But my Lord of Derry not contented with this, would have the utmost resolution of our Faith to be into the Doctrine of the Schools. I do not think that all the Bishops be of his mind. If they were, I would wish them to stand in fear of that dreadful Sentence, All covet all lose. I must not let pass these words of his Lordship, If divine Law and humane Law clash one with another, without doubt it is better evermore to obey God than man.

Where the King is a Christian, believes the Scripture, and hath the Legislative power both in Church and State, and maketh no Laws concerning Christian Faith, or divine Worship, but by the Counsel of his Bishops whom he trusteth in that behalf, if the Bishops counsel him aright, what clashing can there be between the divine and humane Laws? For if the Civil Law be against God's Law and the Bishops make it clearly appear to the King that it clasheth with divine Law, no doubt he will mend it by himself or by the advice of his Parliament; for else he is no professor of Christ's Doctrine, and so the clashing is at an end. But if they think that every opinion they hold, though obscure and unnecessary to Salvation, ought presently to be Law, then there will be clashings innumerable, not only of Laws, but also of Swords, as we have found it too true by late experience. But his Lordship is still at this, that there ought to be, for the divine Laws that is to say, for the interpretation of Scripture, a Legislative power in the Church, distinct from that of the King, which under him they enjoy already. This I deny. Then for clashing between the Civil Laws of Infidels with the Law of God, the Apostles teach that those their Civil Laws are to be obeyed, but so as to keep their Faith in Christ entirely in their hearts; which is an obedience easily performed. But I do not believe that Augustus Caesar or Nero was bound to make the holy Scripture Law; and yet unless they did so they could not attain to eternal life.

J. D.

His fifth conclusion may be, that the sharpest and most successful Sword, in any War whatsoever, doth give Sovereign Power and Authority to him that hath it, to approve or reject all sorts of Theological Doctrines, concerning the Kingdom of God, not according to their truth or falshood, but according to that influence which they have upon political affairs. Hear him, But because this Doctrine will appear to most men a novelty, I do but propound it, maintaining nothing in this or any other Paradox of Religion,

but attending the end of that dispute of the Sword, concerning the Authority (not yet amongst my Country-men decided) by which all sorts of Doctrine are to be approved or rejected, &c. For, the points of Doctrine concerning the Kingdom of God, have so great influence upon the Kingdom of Man, as not to be determined, but by them that under God have the Sovereign Power.

— Careat successibus opto,
Quisquis ab eventu facta notanda putat.

Let him evermore want success who thinketh actions are to be judged by their events. This Doctrine may be plausible to those who desire to fish in troubled Waters. But it is justly hated by those which are in Authority, and all those who are lovers of peace and tranquillity.

The last part of this conclusion smelleth rankly of Jeroboam, Now shall the Kingdom return to the house of David, if this people go up to do Sacrifice in the house of the Lord at Jerusalem; whereupon the King took counsel, and made two Calves of Gold, and said unto them, It is too much for you to go up to Jerusalem, behold thy Gods O Israel, which brought thee out of the Land of Aegypt. But by the just disposition of Almighty God this Policy turned to a sin, and was the utter destruction of Jeroboam and his Family. It is not good jesting with edge-tools, nor playing with holy things: Where men make their greatest fastness, many times they find most danger.

T. H.

His Lordship either had a strange Conscience, or understood not English. Being at Paris when there was no Bishop nor Church in England, and every man writ what he pleased, I resolved (when it should please God to restore the Authority Ecclesiastical) to submit to that Authority, in whatsoever it should determine. This his Lordship construes for a temporizing and too much indifferency in Religion; and says further that the last part of my words do smell of Jeroboam. To the contrary I say my words were modest,

and such as in duty I ought to use. And I profess still that whatsoever the Church of England (the Church, I say, not every Doctor) shall forbid me to say in matter of Faith, I shall abstain from saying it, excepting this point. That Jesus Christ the Son of God dyed for my sins. As for other Doctrins, I think it unlawful if the Church define them, for any Member of the Church to contradict them.

J. D.

His sixth Paradox is a rapper, the Civil Laws are the Rules of good and evil, just and unjust, honest and dishonest, and therefore what the Lawgiver commands that is to be accounted good, what he forbids bad. And a little after, before Empires were, just and unjust were not, as whose nature is Relative to a Command, every action in its own nature is indifferent. That it is just or unjust proceedeth from the right of him that commandeth. Therefore lawful Kings make those things which they command, Just by commanding them, and those things which they forbid Vnjust by forbidding them. To this add his definition of a sin, that which one doth, or omitteth, saith, or willeth contrary to the reason of the Common-wealth, that is, the [Civil] Laws. Where by the Laws he doth not understand the Written Laws, elected and approved by the whole Common-wealth, but the verbal Commands or Mandates, of him that hath the Sovereign Power, as we find in many places of his Writings. The Civil Laws are nothing else but the Commands of him, that is endowed with Sovereign Power in the Common-wealth, concerning the future actions of his Subjects. And the Civil Laws are fastned to the Lips of that man who hath the Sovereign Power.

Where are we? In Europe or in Asia? Where they ascribed a Divinity to their Kings, and, to use his own Phrase, made them Mortal Gods. O King live for ever. Flatterers are the common Moths of great Pallaces, where Alexander's friends are more numerous than the King's friends. But such gross palpable pernicious flattery as this is, I did never meet with, so

derogatory both to piety and policy. What deserved he who should do his uttermost endeavour to poyson a common Fountain, whereof all the Common-wealth must drink? He doth the same who poisoneth the mind of a Sovereign Prince.

Are the Civil Laws the Rules of good and bad, just and unjust, honest and dishonest? And what I pray your are the Rules of the Civil Law it self? Even the Law of God and Nature. If the Civil Laws swerve from these more authentick Laws, they are Lesbian Rules. What the Lawgiver commands is to be accounted good, what he forbids bad. This was just the garb of the Athenian Sophisters, as they are described by Plato. Whatsoever pleased the great Beast [the Multitude] they call holy, and just, and good. And whatsoever the great Beast disliked, they called evil, unjust, prophane. But he is not yet arrived at the height of his flattery. Lawful Kings make those things which they command just by commanding them. At other times when he is in his right wits he talketh of sufferings, and expecting their reward in Heaven. And going to Christ by Martyrdome. And if he had the fortitude to suffer death he should do better. But I fear all this was but said in jest. How should they expect their reward in Heaven, if his Doctrine be true, that there is no reward in Heaven? Or how should they be Martyrs, if his Doctrine be true, that none can be Martyrs but those who conversed with Christ upon earth? He addeth, Before Empires were, just and unjust were not. Nothing could be written more false in his sence, more dishonourable to God, more inglorious to the humane nature. That God should create Man and leave him presently without any Rules, to his own ordering of himself, as the Ostridg leaveth her Eggs in the sand. But in truth there have been Empires in the World ever since Adam. And Adam had a Law written in his heart by the finger of God, before there was any Civil Law. Thus they do endeavour to make goodness, and justice, and honesty, and conscience, and God himself, to be empty names, without any reality, which signifie

nothing, further than they conduce to a man's interest. Otherwise he would not, he could not say, That every action as it is invested with its circumstances, is indifferent in its own nature.

T. H.

My sixth Paradox he calls a Rapper. A Rapper, a Swapper and such like terms are his Lordships elegancies. But let us see what this Rapper is. 'Tis this, The Civil Laws are the Rules of Good and Evil, Just and Unjust, Honest and Dishonest. Truly I see no other Rules they have. The Scriptures themselves were made Law to us here, by the Authority of the Commonwealth, and are therefore part of the Law Civil. If they were Laws in their own nature, then were they Laws over all the World, and men were obliged to obey them in America, as soon as they should be shown there (though without a Miracle) by a Frier. What is Injust but the Transgression of a Law? Law therefore was before Unjust. And the Law was made known by Sovereign Power before it was a Law. Therefore Sovereign Power was antecedent both to Law and Injustice. Who then made Injust but Sovereign Kings or Sovereign Assemblies? Where is now the wonder of this Rapper, That Lawful Kings make those things which they command Just by commanding them, and those things which they forbid Unjust by forbidding them? Just and Unjust were surely made; if the King made them not, who made them else? For certainly the breach of a Civil Law is a sin against God. Another Calumny which he would fix upon me, is, That I make the King's verbal Commands to be Laws. How so? Because I say the Civil Laws are nothing else but the Commands of him that hath the Sovereign Power, concerning the future Actions of his Subjects. What verbal Command of a King can arrive at the ears of all his Subjects (which it must do ere it be a Law) without the Seal of the Person of the Commonwealth (which is here the Great Seal of England?) Who but his Lordship ever denied that the command of England was a Law to English men? Or that

any but the King had Authority to affix the Great Seal of England to any Writing? And who did ever doubt to call our Laws (though made in Parliament) the King's Laws? What was ever called a Law which the King did not assent to? Because the King has granted in divers cases not to make a Law without the advice and assent of the Lords and Commons, therefore when there is no Parliament in being, shall the Great Seal of England stand for nothing? What was more unjustly maintained during the long Parliament (besides the resisting and Murdering of the King) then this Doctrine of his Lordship's? But the Bishop endeavoured here to make the Multitude believe I maintain, That the King sinneth not though he bid hang a man for making his Apparel otherwise than he appointed, or his Servant for negligent attendance. And yet he knew I distinguished always between the King's natural and politick capacity. What name should I give to this wilful slander? But here his Lordship enters into passion, and exclaims, Where are we, in Europe or in Asia? Gross, palpable, pernicious flattery, poisoning of a Common-wealth, poysoning the King's mind. But where was his Lordship when he wrote this? One would not think he was in France, nor that this Doctrine was Written in the year 1658, but rather in the year 1648, in some Cabal of the King's enemies. But what did put him into this fit of Choller? Partly, this very thing, that he could not answer my reasons; but chiefly, that he had lost upon me so much School-learning in our controversie touching Liberty and Necessity, wherein he was to blame himself, for believing that the obscure and barbarous Language of School Divinity could satisfie an ingenuous Reader as well as plain and perspicuous English. Do I flatter the King? Why am I not rich? I confess his Lordship has not flattered him here.

J. D.

Something there is which he hath a confused glimmering of, as the blind man sees men walking like Trees, which he is not able to apprehend and express clearly. We acknowledge, that though the Laws or Commands of a

Soveraign Prince be erroneous, or unjust, or injurious, such as a Subject cannot approve for good in themselves; yet he is bound to acquiesce, and may not oppose or resist, otherwise than by Prayers and Tears, and at the most by flight. We acknowledge that the Civil Laws have power to bind the Conscience of a Christian, in themselves, but not from themselves, but from him who hath said, Let every Soul be subject to the higher Powers. Either they bind Christian Subjects to do their Soveraign's Commands, or to suffer for the Testimony of a good Conscience. We acknowledge that in doubtful Cases *semper praesumitur pro Rege & Lege*, the Soveraign and the Law are always presumed to be in the right. But in plain evident cases which admit no doubt, it is always better to obey God than man. Blunderers whilst they think to mend one imaginary hole, make two or three real ones. They who derive the Authority of the Scriptures or God's Law from the Civil Laws of men, are like those who seek to underprop the Heavens from falling with a Bullrush. Nay, they derive not only the Authority of the Scripture, but even the Law of nature it self from the Civil Law. The Laws of nature (which need no promulgation) in the condition of nature are not properly Laws, but qualities which dispose men to peace and obedience. When a Commonwealth is once settled, then are they actually Laws and not before. God help us, into what times are we fallen, when the immutable Laws of God and Nature are made to depend upon the mutable Laws of mortal men, just as one should go about to controll the Sun by the Authority of the Clock.

T. H.

Hitherto he never offered to mend any of the Doctrines he inveighs against; but here he does. He says I have a glimmering of something I was not able to apprehend and express clearly. Let us see his Lordship's more clear expression. We acknowledge, (saith he) that though the Laws or Commands of a Soveraign Prince be erroneous, or unjust, or injurious, such as a Subject cannot approve for good in themselves, yet he is bound to

acquiesce, and may not oppose or resist otherwise than by Prayers and Tears, and at the most by Flight. Hence it follows clearly, that when a Sovereign has made a Law, though erroneous, then if his Subject oppose it, it is a sin. Therefore I would fain know, when a man has broken that Law by doing what it forbad, or by refusing to do what it commanded, whether he have opposed this Law or not. If to break the Law be to oppose it, he granteth it. Therefore his Lordship has not here expressed himself, so clearly as to make men understand the difference between breaking a Law and opposing it. Though there be some difference between breaking of a Law, and opposing those that are sent with force to see it executed; yet between breaking and opposing the Law it self there is no difference. Also though the Subject think the Law just, as when a Thief is by Law Condemned to dye, yet he may lawfully oppose the Execution, not only by Prayers, Tears and Flight, but also (as I think) any way he can. For though his fault were never so great, yet his endeavour to save his own life is not a fault. For the Law expects it, and for that cause appointeth Felons to be carryed bound and encompassed with Armed men to Execution. Nothing is opposite to Law but sin. Nothing opposite to the Sheriff but force. So that his Lordship's sight was not sharp enough to see the difference between the Law and the Officer. Again, We acknowledge (says he) that the Laws have power to bind the Conscience of a Christian in themselves, but not from themselves. Neither do the Scriptures bind the Conscience because they are Scriptures, but because they were from God. So also the Book of English Statutes bindeth our Consciences in it self, but not from it self, but from the Authority of the King, who only in the right of God has the legislative Powers. Again he saith, We acknowledge that in doubtful cases, the Sovereign and the Law are always presumed to be in the right. If he presume they are in the right, how dare he presume that the cases they determine are doubtful? But saith he, in evident cases which admit no doubt

it is always better to obey God than man. Yes, and in doubtful cases also say I. But not always better to obey the inferior Pastors than the Supream Pastor, which is the King. But what are those cases that admit no doubt? I know but very few, and those are such as his Lordship was not much acquainted with.

J. D.

But it is not worthy of my labour, nor any part of my intention, to pursue every shadow of a Question which he springeth. It shall suffice to gather a Posie of Flowers (or rather a bundle of Weeds) out of his Writings, and present them to the Reader, who will easily distinguish them from healthful Plants by the rankness of their smell. Such are these which follow.

T. H.

As for the following Posie of Flowers, there wants no more to make them sweet, than to wipe off the Venome blown upon some of them by his Lordships breath.

J. D.

1. To be delighted in the imagination only of being possessed of another man's Goods, Servants, or Wife, without any intention to take them from him by force or fraud, is no breach of the Law which saith, Thou shalt not covet.

T. H.

What man was there ever whose imagination of any thing he thought would please him, was not some delight? Or what sin is there, where there is not so much as an intention to do injustice? But his Lordship would not distinguish between delight and purpose, nor between a Wish and a Will. This was venome. I believe, that his Lordship himself even before he was Married took some delight in the thought of it, and yet the Woman then was

not his own. All love is delight, but all love is not sin. Without this love of that which is not yet a mans own, the World had not been Peopled.

J. D.

2. If a Man by the terror of present death be compelled to do a Fact against the Law, he is totally excused, because no Law can oblige a Man to abandon his own preservation, nature compelleth him to the Fact. The like Doctrine he hath elsewhere. When the Actor doth any thing against the Law of Nature by the Command of the Author, if he be obliged by former Covenants to obey him, not he, but the Author breaketh the Law of Nature.

T. H.

The second Flower is both sweet and wholsom.

J. D.

3. It is a Doctrine repugnant to Civil Society, that whatsoever a man does against his Conscience is sin.

T. H.

'Tis plain, that to do what a man thinks in his own Conscience to be sin, is sin; for it is a contempt of the Law it self; and from thence ignorant men, out of an erroneous Conscience, disobey the Law which is pernicious to all Government.

J. D.

4. The Kingdom of God is not shut but to them that sin, that is, to them who have not performed due obedience to the Laws of God; nor to them, if they believe the necessary Articles of the Christian Faith.

5. We must know that the true acknowledging of sin is Repentance it self.

6. An opinion publickly appointed to be taught cannot be Heresie, nor the Sovereign Princes that Authorised the same Hereticks.

T. H.

The 4th. 5th. and 6th. smell well. But to say, that the Sovereign Prince in England is a Heretick, or that an Act of Parliament is Heretical, stinks abominably, as 'twas thought Primo Elizabethae.

J. D.

7. Temporal and Spiritual government are but two words to make men see double and mistake their lawful Sovereign, &c. There is no other Government in this Life, neither of State, nor Religion but Temporal.

8. It is manifest, that they who permit a contrary Doctrine to that which themselves believe and think necessary [to Salvation] do against their Consciences, and Will, as much as in them lyeth the eternal destruction of their Subjects.

T. H.

The 7th. and 8th. are Roses and Jassamin. But his leaving out the words [to Salvation] was venome.

J. D.

9. Subjects sin if they do not worship God according to the Laws of the Common-wealth.

T. H.

The 9th. he hath poisoned, and made it, not mine; he quotes my Book de Cive Ca.19. Where I say, *Regnante Deo per solam rationem naturalem*, that is, Before the Scripture was given, they sinned that refused to worship God,

according to the Rites and Ceremonies of the Country, which hath no ill scent, but to undutiful Subjects.

J. D.

10. To believe in Jesus [in Jesum] is the same as to believe that Jesus is Christ.

T. H.

And so it is always in the Scripture.

J. D.

11. There can be no contradiction between the Laws of God, and the Laws of a Christian Common-wealth. Yet, we see Christian Common-wealths daily contradict one another.

T. H.

The 11th. is also good. But his Lordship's instance, That Christian Common-wealths contradict one another, have nothing to do here. Their Laws do indeed contradict one another, but contradict not the Law of God. For God Commands their Subjects to obey them in all things, and his Lordship himself confesseth that their Laws, though erroneous, bind the Conscience. But Christian Common-wealths would seldome contradict one another, if they made no Doctrine Law, but such as were necessary to Salvation.

J. D.

12. No man giveth but with intention of some good to himself. Of all voluntary Acts, the Object is to every man his own good. Moses, St. Paul, and the Decij were not of his mind.

T. H.

That which his Lordship adds to the 12th. namely, that Moses, St. Paul, and the Decij were not of my mind is false. For the two former did what they did for a good to themselves, which was eternal Life; and the Decij for a good Fame after death. And his Lordship also, if he had believed there is an eternal happiness to come, or thought a good Fame after death to be any thing worth, he would have directed all his actions towards them, and have despised the Wealth and Titles of the present World.

J. D.

13. There is no natural knowledge of man's estate after death, much less of reward which is then to be given to breach of Faith, but only a belief grounded upon other mens saying, that they know it supernaturally, or that they know those that knew them that knew others that knew it supernaturally.

T. H.

The 13th. is good and fresh.

J. D.

14. David's killing of Uriah was no injury to Uriah, because the right to do what he pleased was given him by Uriah himself.

T. H.

David himself makes this good, in saying, To thee only have I sinned.

J. D.

15. To whom it belongeth to determine controversies which may arise from the divers interpretations of Scripture, he hath an imperial power over all men which acknowledge the Scripture to be the Word of God.

16. What is Theft, what is Murder, what is Adultery, and universally what is an injury, is known by the Civil Law, that is, by the Commands of the Sovereign.

T. H.

For the 15th. he should have disputed it with the Head of the Church. And as to the 16th. I would have asked him by what other Law his Lordship would have it determined what is Theft, or what is Injury, than by the Laws made in Parliament, or by the Laws which distinguish between Meum and Tuum? His Lordships ignorance smells rankly ('tis his own phrase) in this and many other places (which I have let pass) of his own Interest. The King tells us what is sin, in that he tells us what is Law. He hath authorised the Clergy to dehort the people from sin, and to exhort them, by good motives, (both from Scripture and Reason) to obey the Laws; and supposeth them (though under forty years old) by the help they have in the University, able in case the Law be not written, to teach the people old and young, what they ought to follow in doubtful cases of Conscience, that is to say, they are authorised to expound the Laws of Nature; but not so as to make it a doubtful case whether the King's Laws be to be obeyed or not. All they ought to do is from the King's Authority. And therefore this my Doctrine is no Weed.

J. D.

17. He admitteth incestuous Copulations of the Heathens, according to their Heathenish Laws to have been lawful Marriages. Though the Scripture teach us expresly, that for those abominations the Land of Canaan spued out her Inhabitants, Levit. 18.28.

T. H.

The 17th. he hath corrupted with a false interpretation of the Text. For in that Chapter from the beginning to verse 20, are forbidden Marriages in certain degrees of kindred. From verse 20, which begins with Moreover (to the 28th.) are forbidden Sacrificing of Children to Molech, and Prophaning of God's name, and Buggery with Man and Beast, with this cause exprest (For all these abominations have the men of the Land done which were before you, and the Land is defiled) That the Land spue not you out also. As for Marriages within the degrees prohibited, they are not referred to the abominations of the Heathen. Besides, for some time after Adam, such Marriages were necessary.

J. D.

18. I say that no other Article of Faith besides this, that Jesus is Christ, is necessary to a Christian man for Salvation.

19. Because Christ's Kingdom is not of this World, therefore neither can his Ministers, unless they be Kings, require obedience in his name. They have no right of Commanding, no power to make Laws.

T. H.

These two smell comfortably, and of Scripture. The contrary Doctrine smells of Ambition and encroachment of Jurisdiction, or Rump of the Roman Tyranny.

J. D.

20. I pass by his errors about Oaths about Vows, about the Resurrection, about the Kingdom of Christ, about the Power of the Keys, Binding, Loosing, Excommunication, &c. his ignorant mistakes of meritum congrui and condigni, active and passive obedience, and many more, for fear of being tedious to the Reader.

T. H.

The tears of School Divinity, of which number are meritum congrui, meritum condigni, and passive obedience, are so obscure as no man living can tell what they mean, so that they that use them may admit or deny their meaning, as it shall serve their turns. I said not that this was their meaning, but that I thought it was so. For no man living can tell what a School man means by his words. Therefore I expounded them according to their true signification. Merit ex condigno is when a thing is deserved by Pact; as when I say the Labourer is worthy of his hire, I mean meritum ex condigno. But when a man of his own grace throweth Money among the people, with an intention that what part soever of it any of them could catch, he that catcheth merits it, not by Pact, nor by precedent Merit, as a Labourer, but because it was congruent to the purpose of him that cast it amongst them. In all other meaning these words are but Jargon, which his Lordship had learnt by rote. Also passive obedience signifies nothing, except it may be called passive obedience when a man refraineth himself, from doing what the Law hath forbidden. For in his Lordship's sense the Thief that is hang'd for stealing hath fulfilled the Law; which I think is absurd.

J. D.

His whole works are a heap of mishapen Errors, and absurd Paradoxes, vented with the confidence of a Jugler, the brags of a Mountebank, and the Authority of some Pythagoras, or third Cato, lately dropped down from Heaven.

Thus we have seen how the Hobbian Principles do destroy the Existence, the Simplicity, the Ubiquity, the Eternity, and Infiniteness of God, the Doctrine of the blessed Trinity, the Hypostatical Union, the Kingly Sacerdotal and Prophetical Office of Christ, the Being and Operation of the Holy Ghost, Heaven, Hell, Angels, Devils, the Immortality of the Soul, the

Catholick and all National Churches; the holy Scriptures, holy Orders, the holy Sacraments, the whole frame of Religion, and the Worship of God; the Laws of Nature, the reality of Goodness, Justice, Piety, Honesty, Conscience, and all that is Sacred. If his Disciples have such an implicate Faith, that they can digest all these things, they may feed with Ostriches.

T. H.

He here concludes his first Chapter with bitter Reproaches, to leave in his Reader (as he thought) a sting, supposing perhaps that he will Read nothing but the beginning and end of his Book, as is the custom of many men. But to make him lose that petty piece of cunning, I must desire of the Reader one of these two things. Either that he would read with it the places of my Leviathan which he cites, and see not only how he answers my arguments, but also what the arguments are which he produceth against them; or else that, he would forbear to condemn me, so much as in his thought; for otherwise he is unjust. The name of Bishop is of great Authority, but these words are not the words of a Bishop, but of a passionate School-man, too fierce and unseemly in any man whatsoever. Besides, they are untrue. Who that knows me will say I have the confidence of a Jugler, or that I use to brag of any thing, much less that I play the Mountebank? What my works are, he was no sit Judge. But now he has provoked me, I will say thus much of them, that neither he, if he had lived could, nor I if I would, can extinguish the light which is set up in the World by the greatest part of them; and for these Doctrines which he impugneth, I have few opposers, but such whose Profit, or whose Fame in Learning is concerned in them. He accuses me first of destroying the Existence of God, that is to say, he would make the World believe I were an Atheist. But upon what ground? Because I say, that God is a Spirit, but Corporeal. But to say that, is allowed me by St. Paul, that says There is a Spiritual Body, and there is an Animal Body. 1 Cor. 15. He that holds that there is a God, and

that God is really somewhat (for Body is doubtlesly a real Substance) is as far from being an Atheist, as is possible to be. But he that says God is an Incorporeal Substance, no man can be sure whether he be an Atheist or not. For no man living can tell whether there be any Substance at all, that is not also Corporeal. For neither the word Incorporeal, nor Immaterial, nor any word equivalent to it is to be found in Scripture, or in Reason. But on the contrary that the Godhead dwelleth bodily in Christ, is found in Colos. 2.9. and Tertullian maintains that God is either a Corporeal Substance or Nothing. Nor was he ever condemned for it by the Church. For why? Not only Tertullian but all the learned call Body, not only that which one can see, but also whatsoever has magnitude, or that is somewhere; for they had greater reverence for the Divine Substance than that they durst think it had no Magnitude or was no where. But they that hold God to be a Phantasm, as did the Exorcists in the Church of Rome, that is, such a thing as were at that time thought to be the Sprights that were said to walk in Church-yards, and to be the Souls of men buried, they do absolutely make God to be nothing at all. But how? Were they Atheists? No. For though by ignorance of the consequence they said that which was equivolent to Atheism, yet in their hearts they thought God a Substance, and would also, if they had known what Substance and what Corporeal meant, have said he was a Corporeal Substance. So that this Atheism by consequence is a very easie thing to be fallen into, even by the most Godly men of the Church. He also that says that God is wholly here, and wholly there, and wholly every where, destroys by consequence the Unity of God, and the Infiniteness of God, and the Simplicity of God. And this the Schoolmen do, and are therefore Atheists by consequence, and yet they do not all say in their hearts that there is no God. So also his Lordship by exempting the Will of man from being subject to the necessity of God's Will or Decree, denies by consequence the Divine Praescience, which also will amount to Atheism by

consequence. But out of this that God is a Spirit corporeal and infinitely pure, there can no unworthy or dishonourable consequence be drawn. Thus far to his Lordship's first Chapter in Justification of my Leviathan, as to matter of Religion; and especially to wipe off that unjust slander cast upon me by the Bishop of Derry. As for the second Chapter which concerns my Civil Doctrines, since my errors there, if there be any, will not tend very much to my disgrace, I will not take the pains to answer it.

Whereas his Lordship has talked in his discourse here and there ignorantly of Heresie, and some others have not doubted to say publickly, that there be many Heresies in my Leviathan; I will add hereunto for a general answer an Historical relation concerning the word Heresie from the first use of it amongst the Graecians, till this present time.

TO THE THIRD PAPER.

**TO THE RIGHT HONOURABLE AND OTHERS, THE
LEARNED MEMBERS OF THE ROYAL SOCIETY, FOR
THE ADVANCEMENT OF THE SCIENCES.**

PRESENTETH TO YOUR Consideration, your most humble servant
Thomas Hobbes, a Confutation of a Theoreme which hath a long time
passed for Truth; to the great hinderance of Geometry, and also of Natural
Philosophy, which thereon dependeth.

THE THEOREME.

THE FOUR SIDES of a Square being divided into any number of equal parts, for example into 10; and straight lines drawn through the opposite points, which will divide the Square into 100 lesser Squares; The received Opinion, and which Dr. Wallis commonly useth, is, that the root of those 100, namely 10, is the side of the whole Square.

THE CONFUTATION.

THE ROOT 10 is a number of those Squares, whereof the whole containeth 100, whereof one Square is an Vnitie; therefore the Root 10, is 10 Squares: Therefore the Root of 100 Squares is 10 Squares, and not the side of any Square; because the side of a Square is not a Superficies, but a Line. For as the root of 100 Vnities is 10 Vnities, or of 100 Souldiers 10 Souldiers: so the root of 100 Squares is 10 of those Squares. Therefore the Theoreme is false; and more false, when the root is augmented by multiplying it by other greater numbers.

Hence it followeth, that no Proposition can either be demonstrated or confuted from this false Theoreme. Upon which, and upon the Numeration of Infinites, is grounded all the Geometry which Dr. Wallis hath hitherto published.

And your said servant humbly prayeth to have your Judgement hereupon: And that if you finde it to be false, you would be pleased to correct the same; and not to suffer so necessary a Science as Geometry to be stifled, to save the Credit of a Professor.

Three PAPERS Presented to the ROYAL SOCIETY Against Dr. WALLIS. Together with CONSIDERATIONS ON Dr. Wallis his ANSWER to them.

By THO. HOBBS of Malmsbury.

LONDON: Printed for the Author; and are to be had at the Green Dragon without Temple-bar. 1671.

**TO THE RIGHT HONOURABLE AND OTHERS, THE
LEARNED MEMBERS OF THE ROYAL SOCIETY, FOR
THE ADVANCEMENT OF THE SCIENCES.**

YOUR MOST HUMBLE servant Thomas Hobbes presenteth, That the quantity of a Line calculated by extraction of Roots, is not to be truly found. And further presenteth to you the Invention of a Straight Line equal to the Arc of a Circle.

A Square Root is a number which multiplied into it self produceth a number. And the number so produced is called a Square number. For example: Because 10 multiplied into 10 makes 100; the Root is 10, and the Square number 100.

CONSEQUENT.

IN THE NATURAL row of Numbers, as 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, &c. every one is the Square of some number in the same row. But Square numbers (beginning at 1) intermit first two numbers, then four, then six, &c. So that none of the intermitted numbers is a Square number, nor has any Square root.

PROP. I.

A SQUARE ROOT (speaking of quantity) is not a Line, such as Euclide defines, without Latitude, but a Rectangle.

Suppose A B C D be the Square, and AB, BC, CD, DA be the sides; and every side divided into 10 equal parts, and Lines drawn through the opposite points of division; there will then be made 100 lesser Squares, which taken all together are equal to the Square ABCD. Therefore the whole Square is 100, whereof one Square is an Unit; therefore 10 Units, which is the Root, is ten of the lesser Squares, and consequently has Latitude; and therefore it cannot be the side of a Square, which according to Euclide is a Line without Latitude.

CONSEQUENT.

IT FOLLOWS HENCE, that whosoever taketh for a Principle, That a Side of a Square is a meer Line without Latitude, and That the Root of a Square is such a Line, (as Dr. Wallis continually does) demonstrates nothing.

But if a Line be divided into what number of equal parts soever, so the Line have bredth allowed it, (as all Lines must, if they be drawn) and the length be to the bredth as Number to an Unite, the Side and the Root will be all of one length.

PROP. II.

ANY NUMBER GIVEN is produced by the greatest Root multiplied into it self, and into the remaining Fraction. Let the Number given be two hundred Squares, the greatest Root is $14 \frac{4}{14}$ Squares. I say, that 200 is equal to the product of 14 into it self, together with 14 multiplied into $\frac{4}{14}$. For 14 multiplied into it self, makes 196. And 14 into $\frac{4}{14}$ makes $\frac{56}{14}$, which is equal to 4. And 4 added to 196 maketh 200; as was to be proved.

Or take any other Number 8, the greatest Root is 2; which multiplied into it self is 4, and the Remainder $\frac{4}{2}$ multiplied into 2 is 4; and both together 8.

PROP. III.

BUT THE SAME Square calculated Geometrically by the like parts, consisteth (by Eucl. 2.4.) of the same numeral great Square 196, and of the two Rectangles under the greatest side 14, and the Remainder of the side, or (which is all one) of one Rectangle under the greatest side, and double the Remainder of the side; and further of the Square of the less Segment; which all together make 200, and moreover $\frac{1}{49}$ of those 200 Squares, as by the operation it self appeareth thus.

The side of the greater Segment is

- $14\frac{1}{4}$.
- $14\frac{1}{4}$.

Which multiplied into it self, makes 200.

The product of 14 the greatest segment, into the two Fractions $\frac{4}{14}$, that is, into $\frac{4}{14}$ (or into twice $\frac{2}{14}$) is $\frac{56}{14}$ (that is 4) and that 4 added to 196 makes 200.

Lastly, the product of $\frac{2}{14}$ into $\frac{2}{142}$ or $\frac{1}{7}$ into $\frac{1}{7}$, is $\frac{1}{49}$.

And so the same Square calculated by Roots, is less by $\frac{1}{49}$ of one of those two hundred Squares, then by the true and Geometrical Calculation; as was to be demonstrated.

CONSEQUENT.

IT IS HENCE manifest, That whosoever calculates the length of an Arc or other Line by the extraction of Roots, must necessarily make it shorter then the truth, unless the Square have a true Root.

**THE RADIUS OF A CIRCLE IS A MEAN PROPORTIONAL
BETWEEN THE ARC OF A QUADRANT AND TWO
FIFTHS OF THE SAME.**

DESCRIBE A SQUARE ABCD, and in it a Quadrant DCA. In the side DC take DT two fifths of DC; and between DC and DT a Mean Proportional DR; and describe the Quadrantal Arcs RS, TV.

I say, the Arc RS is equal to the streight line DC.

For seeing the proportion of DC to DT is duplicate of the proportion of DC to DR, it will be also duplicate of the proportion of the Arc CA to the Arc RS; and likewise duplicate of the proportion of the Arc RS to the Arc TV.

Suppose some other Arc less or greater then the Arc RS to be equal to DC, as for example rs: Then the proportion of the Arc rs to the streight line DT will be duplicate of the proportion of RS to TV, or DR to DT. Which is absurd; because Dr is by construction greater or less then DR.

Therefore the Arc RS is equal to the side DC. Which was to be demonstrated.

COROL.

HENCE IT FOLLOWS that DR is equal to two fifths of the Arc CA. For RS, TV, DT being continually proportional; and the Arc TV being described by DT, the Arc RS will be described by a streight line equal to TV. But RS is described by the streight line DR. Therefore DR is equal to TV, that is, to two fifths of CA.

And your said servant most humbly prayeth you to consider (if the demonstration be true and evident) whether the way of objecting against it by Square Roots, used by Dr. Wallis; and whether all his Geometry, as being, built upon it, and upon his supposition of an Infinite Number, be not false.

CONSIDERATIONS UPON THE ANSWER OF DR. WALLIS TO THE THREE PAPERS OF MR. HOBBS.

DR. WALLIS SAYES, All that is affirmed, is but, If we SUPPOSE That, This will follow.

But it seemeth to me, that if the Supposition be impossible, then that which follows will either be false, or at least undemonstrated.

First, this Proposition being founded upon his Arithmetica Infinitorum, If there he affirm an absolute Infiniteness, he must here also be understood to affirm the same. But in his 39th Proposition he saith thus: Seeing that the number of terms increasing, the excess above sub-quadruple is perpetually diminished, so as at last it becomes less than any proportion that can be assigned; If it proceed in infinitum it must utterly vanish. And therefore if there be propounded an Infinite row of quantities in triplicate proportion of quantities Arithmetically proportional (that is, according to the row of Cubical numbers) beginning from a point or 0; that row shall be to a row of as many, equal to the greatest, as 1 to 4.

It is therefore manifest that he affirms, That in an Infinite row of quantities the last is given; and he knows well enough that this is but a shift.

Secondly, he says, That usually in Euclide and all after him, by Infinite is meant but, more than any assignable Finite, or the greatest possible.

I am content it be so interpreted. But then from thence he must demonstrate those his conclusions, which he hath not yet done. And when he shall have done it, not only the Conclusions, but also the Demonstration will be the same with mine in Ca. Art. 2, 3, &c. of my Book De Corpore. And so he steals what he once condemn'd. A fine quality.

Thirdly, he sayes (by Euclides 10th Proposition, but he tells not of what Book) That a Line may be bisected, and the halves of it may again be bisected, and so onwards infinitely; and that upon such supposed Section Infinitely continued, the parts must be supposed Infinitely many.

I deny that; for Euclide, if he sayes a Line may be divisible into parts perpetually divisible, he means, That all the divisions, and all the parts arising from those divisions, are perpetually Finite in number.

Fourthly, he sayes, That there may be supposed a row of quantities infinitely many, and continually increasing, whereof the last is given.

'Tis true, a man may say (if that be supposing) that white is black; but if Supposing be Thinking, he cannot suppose an Infinite row of quantities whereof the last is given. And if he say it, he can demonstrate nothing from it.

Fifthly, He sayes (for one absurdity begets another) That a Superficies or Solid may be supposed so constituted, as to be Infinitely long, but Finitely great (the breadth continually decreasing in greater proportion than the length increaseth) and so as to have no center of gravity. Such is Toricellio's Solidum Hyperbolicum acutum, and others innumerable discovered by Dr. Wallis, Monsieur Fermat, and others. But to determine this, requires more of Geometry and Logick (whatsoever it do of the Latine Tongue) than Mr. Hobbes is master of.

I do not remember this of Toricellio, and I doubt Dr Wallis does him wrong, and Monsieur Fermat too. For to understand this for sense, 'tis not required that a man should be a Geometrician or a Logician, but that he should be mad.

In the next place he puts to me a Question as absurd as his Answers are to mine. Let him ask himself (saith he) if he be still of opinion, That there is no Argument in Natural Philosophy to prove that the World had a beginning: First, whether in case it had no beginning, there must not have

passed an Infinite number of years before Mr. Hobbes was born. Secondly, whether at this time there have not passed more, that is, more than that Infinite number. Thirdly, whether, in that Infinite (or more than Infinite) number of years, there have not been a greater number of dayes and hours, and of which hitherto the last is given. Fourthly, whether, if this be an Absurdity, we have not then (contrary to what Mr. Hobbes would perswade us) an Argument in Nature to prove the World had a beginning.

To this I answer, not willingly, but in service to the Truth, that by the same Argument he might as well prove that God had a beginning. Thus: in case he had not, there must have passed an Infinite length of time before Mr. Hobbes was born; but there hath passed at this day more than that Infinite length (by eighty four years). And this day, which is the last, is given. If this be an Absurdity, have we not then an Argument in Nature to prove that God had a beginning? Thus 'tis when men intangle themselves in a Dispute of that which they cannot comprehend. But perhaps he looks for a Solution of his Argument to prove that there is somewhat greater than Infinite; which I shall do so far, as to shew it is not concluding. If from this day backwards to Eternity be more than Infinite, and from Mr. Hobbes his birth backwards to the same Eternity be Infinite, then take away from this day backwards to the time of Adam, which is more than from this day to Mr. Hobbes his birth, then that which remains backwards must be less than Infinite. All this arguing of Infinities is but the ambition of School-boys.

TO THE LATTER PART OF THE FIRST PAPER.

THERE IS NO doubt, if we give what Proportion we will of the Radius to the Arc, but that the Arc upon that Arc will have the same Proportion. But that is nothing to my Demonstration. He knows it, and wrongs the Royal Society in presuming they cannot find the Impertinence of it.

My proof is this; That if the Arc on TV, and the Arc RS, and the streight Line CD, be not equal, then the Arc on TV, the Arc on RS, and the Arc on CA, cannot be proportional. Which is manifest by supposing in DC a less than the said DC; but equal to RS, and another streight Line, less than RS, equal to the Arc on TV; and any body may examine it by himself.

I have been asked by some that think themselves Logicians, Why I proceeded upon $\frac{2}{5}$ rather than any other part of the Radius. The reason I had for it was, That long ago some Arabians had determined, That a streight Line whose square is equal to 10 squares of half the Radius, is equal to a quarter of the Perimeter; but their demonstrations are lost. From that Equality it follows, that the third proportional to the Quadrant and Radius, must be a mean proportional between the Radius and $\frac{2}{5}$ of the same. But my answer to the Logicians was, That though I took any part of the Radius to proceed on, and lighted on the Truth by chance, the Truth it self would appear by the Absurdity arising from the denial of it. And this is it that Aristotle meant, where he distinguisheth between a Direct demonstration, and a demonstration leading to an absurdity. Hence it appears, that Dr. Wallis his objections to my Rosetum are invalid, as built upon Roots.

TO THE SECOND PAPER.

FIRST, HE SAYES, That it concerns him no more than other men. Which is true. I meant it against the whole Herd of them who apply their Algebra to Geometry.

Secondly, He sayes, That a bare Number cannot be the Side of a Square figure.

I would know what he means by a Bare Number. Ten Lines may be the side of a Square figure. Is there any Number so bare, as by it we are not to conceive or consider any thing numbred? Or by ten Nothings understands he Bare 10? He struggles in vain, his Conscience puzzles him.

Thirdly, He sayes, Ten Squares is the Root of 100 Square-squares. To which I answer, first, That there is no such Figure as a Square-square. Secondly, That it follows hence that a Root is a Superficies, for such is 10 Squares.

Lastly, He sayes, That neither the Number 10, nor 10 Souldiers is the Root of 100 Souldiers; because 100 Souldiers is not the Product of 10 Souldiers into 10 Souldiers.

That last I grant, because nothing but Numbers can be multiplied into one another. A Souldier cannot be multiplied by a Souldier. But no more can a Square-figure by a Square-figure, though a Square-number may. Again, If a Captain will place his hundred Men in a square Form, must not he take the Root of 100 to make a Rank or File? And are not those 10 Men?

TO THE THIRD PAPER.

HE OBJECTS NOTHING here, but that, The Side of a Square is not a Superficies but a Line, and that a Square Root (speaking of quantity) is not a Line but a Rectangle, is a contradiction. The Reader is to judge of that.

To his Scoffings I say no more, but that they may be retorted in the same words, and are therefore childish.

And now I submit the whole to the Royal Society, with confidence that they will never ingage themselves in the maintenance of these Unintelligible Doctrines of Dr. Wallis, that tend to the suppression of the Sciences which they endeavour to advance.

Ten Dialogues of Natural Philosophy

OR, DECAMERON PHYSIOLOGICUM

1678 EDITION

CONTENTS

CAP. I. OF THE ORIGINAL OF NATURAL PHILOSOPHY.

CAP. II. OF THE PRINCIPLES AND METHOD OF NATURAL
PHILOSOPHY.

CAP. III. OF VACUUM.

CAP. IV. OF THE SYSTEME OF THE WORLD.

CAP. V. OF THE MOTIONS OF WATER AND AIR.

CAP. VI. OF THE CAUSES AND EFFECTS OF HEAT AND COLD.

CAP. VII. OF HARD AND SOFT, AND OF THE ATOMES THAT FLIE
IN THE AIR.

CAP. VIII. OF GRAVITY AND GRAVITATION.

CAP. IX. OF THE LOADSTONE, AND ITS POLES; AND WHETHER
THEY SHEW THE LONGITUDE OF PLACES ON THE EARTH.

CAP. X. OF TRANSPARENCE, REFRACTION; AND OF THE POWER
OF THE EARTH TO PRODUCE LIVING CREATURES.

A 1688 line engraving of Hobbes

Decameron Physiologicum:
OR, TEN DIALOGUES OF NATURAL PHILOSOPHY.

By THOMAS HOBBS of Malmsbury.

To which is added
The Proportion of a straight Line to half the Arc of a Quadrant.

By the same AUTHOR.

LONDON: Printed by J. C. for W. Crook at the Green Dragon without
Temple-Bar.

1678.

CAP. I. OF THE ORIGINAL OF NATURAL PHILOSOPHY.

A.

I Have heard exceeding highly commended a kinde of thing which I do not well understand, though it be much talkt of, by such as have not otherwise much to do, by the name of Philosophy. And the same again by others as much despised and derided. So that I cannot tell whether it be good or ill, nor what to make of it, though I see many other men that thrive by it.

B.

I doubt not, but what so many do so highly praise must be very admirable, and what is derided and scorn'd by many, foolish and ridiculous. The honour and scorn falleth finally not upon Philosophy, but upon the Professors. Philosophy is The knowledge of Natural Causes. And there is no Knowledge but of Truth. And to know the true Causes of things, was never in contempt, but in admiration. Scorn can never fasten upon Truth. But the difference is all in the Writers and Teachers. Whereof some have neither studied, nor care for it, otherwise than as a Trade to maintain themselves or gain Preferment; and some for Fashion, and to make themselves fit for ingenious Company: and their study hath not been meditation, but acquiescence in the Authority of those Authors whom they have heard commended. And some (but few) there be, that have studied it for Curiosity, and the delight which commonly men have in the acquisition of Science, and in the mastery of difficult and subtil Doctrines. Of this last sort I count Aristotle, and a few others of the Ancients, and some few

Moderns: and to these it is that properly belong the Praises which are given to Philosophy.

A.

If I have a minde to study (for example Natural Philosophy) must I then needs read Aristotle, or some of those that now are in request?

B.

There's no necessity of it. But if in your own meditation you light upon a difficulty, I think 'tis no loss of time, to enquire what other men say of it, but to rely onely upon Reason. For though there be some few Effects of Nature (especially concerning the Heavens) whereof the Philosophers of old time have assigned very rational Causes, such as any man may acquiesce in, as of Eclipses of the Sun and Moon by long observation, and by the Calculation of their visible Motions; yet what is that to the numberless and quotidian Phaenomena of Nature? Who is there amongst them or their Successors, that has satisfied you with the Causes of Gravity, Heat, Cold, Light, Sense, Colour, Noise, Rain, Snow, Frost, Winds, Tides of the Sea, and a thousand other things which a few mens lives are too short to go through, and which you and other curious Spirits admire (as quotidian as they are) and fain would know the Causes of them, but shall not finde them in the Books of Naturalists; and when you ask what are the Causes of any of them, of a Philosopher now, he will put you off with mere words; which words, examined to the bottom, signifie not a jot more than I cannot tell, or Because it is: Such as are Intrinsecal quality, Occult quality, Sympathy, Antipathy, Antiperistasis, and the like. Which pass well enough with those that care not much for such wisdom, though wise enough in their own ways; but will not pass with you that ask not simply what's the Cause, but in what manner it comes about that such Effects are produced.

A.

That's Cozening. What need had they of that? When began they thus to play the Charletants?

B.

Need had they none. But know you not that men from their very birth, and naturally, scramble for every thing they covet, and would have all the world, if they could, to fear and obey them? If by fortune or industry one light upon a Secret in Nature, and thereby obtain the credit of an extraordinary Knowing man, should he not make use of it to his own benefit? There is scarce one of a thousand but would live upon the charges of the people as far as he dares. What poor Geometrician is there, but takes pride to be thought a Conjurer? what Mountebank would not make a living out of a false opinion that he were a great Physician? And when many of them are once engaged in the maintenance of an Errour, they will joyn together for the saving of their Authority to decry the Truth.

A.

I pray, tell me, if you can, how and where the study of Philosophy first began.

B.

If we may give Credit to old Histories, the first that studyed any of the Natural Sciences were the Astronomers of Aethiopia. My Author is Diodorus Siculus, accounted a very faithful Writer, who begins his History as high as is possible, and tells us that in Aethiopia were the first Astronomers; and that for their Predictions of Eclipses, and other

Conjunctions and Aspects of the Planets, they obtained of their King not onely Towns and Fields to a third part of the whole Land, but were also in such veneration with the People, that they were thought to have discourse with their Gods, which were the Stars; and made their Kings thereby to stand in awe of them, that they durst not either eat or drink but what and when they prescribed; no nor live, if they said the Gods commanded them to die. And thus they continued in subjection to their false Prophets, till by one of their Kings, called Ergamenes, (about the time of the Ptolemies) they were put to the Sword. But long before the time of Ergamenes, the Race of these Astrologers (for they had no Disciples but their own Children) was so numerous, that abundance of them (whether sent for or no I cannot tell) transplanted themselves into Egypt, and there also had their Cities and Lands allowed them, and were in request not onely for Astronomy and Astrologie, but also for Geometry. And Egypt was then as it were an University to all the world, and thither went the curious Greeks, as Pythagoras, Plato, Thales, and others, to fetch Philosophy into Greece. But long before that time, abundance of them went into Assyria, and had their Towns and Lands assigned them also there; and were by the Hebrews called Chaldies.

A.

Why so?

B.

I cannot tell; but I finde in Martinius Lexicon they were called Chasdim, and Chesdim, and (as he saith) from one Chesed the son of Nachor; but I finde no such man as Chesed amongst the issue of Noah in the Scripture. Nor do I finde that there was any certain Country called Chaldaea; though a Town where any of them inhabited were called A Town of the Chaldies.

Martinius saith further, that the same word Chasdim did signifie also Demons.

A.

By this reckoning I should conjecture they were called Chusdim, as being a Race of Ethiopians. For the Land of Chus is Aethiopia; and so the name degenerated first into Chuldim, and then into Chaldim; so that they were such another kinde of people as we call Gypsies; saving that they were admired and feared for their Knavery, and the Gypsies counted Rogues.

B.

Nay pray, except Claudius Ptolomaeus, Author of that great Work of Astronomy, the Almagest.

A.

I grant he was excellent both in Astronomy and Geometry, and to be commended for his Almagest; but then for his Judiciar Astrologie annexed to it, he is again a Gypsie. But the Greeks that travelled (you say) into Egypt, what Philosophy did they carry home?

B.

The Mathematiques and Astronomy. But for that sublunary Physiques, which is commonly called Natural Philosophy, I have not read of any Nation that studied it earlier than the Greeks, from whom it proceeded to the Romans. Yet both Greeks and Romans were more addicted to Moral than to Natural Philosophy; in which kinde we have their Writings, but loosly and incoherently, written upon no other Principles than their own Passions and Presumptions, without any respect to the Laws of Common-

wealth, which are the ground and measure of all true Morality. So that their Books tend rather to teach men to censure than to obey the Laws. Which has been a great hinderance to the Peace of the Western world ever since. But they that seriously applied themselves to Natural Philosophy were but few, as Plato and Aristotle, whose Works we have; and Epicurus, whose Doctrine we have in Lucretius. The Writings of Philolaus and many other curious Students being by fire or negligence now lost: though the Doctrine of Philolaus concerning the Motion of the Earth have been revived by Copernicus, and explained and confirmed by Galileo now of late.

A.

But methinks the Natural Philosophy of Plato and Aristotle, and the rest, should have been cultivated and made to flourish by their Disciples.

B.

Whom do you mean, the Successors of Plato, Epicurus, Aristotle, and the other first Philosophers? It may be some of them may have been learned and worthy men. But not long after, and down to the time of our Saviour and his Apostles, they were for the most part a sort of needy, ignorant, impudent cheating fellows, who by the profession of the Doctrine of those first Philosophers, got their living. For at that time, the name of Philosophy was so much in fashion and honour amongst great persons, that every rich man had a Philosopher of one Sect or another to be a Schoolmaster to his Children. And these were they that faining Christianity, with their disputing and readiness of talking got themselves into Christian Commons, and brought so many Heresies into the Primitive Church, every one retaining still a tang of what they had been us'd to teach.

A.

But those Heresies were all condemned in the first Council of Nice.

B.

Yes. But the Arrian Heresie for a long time flourished no less than the Roman, and was upheld by divers Emperours, and never fully extinguished as long as there were Vandals in Christendom. Besides, there arose daily other Sects, opposing their Philosophy to the Doctrine of the Councils concerning the Divinity of our Saviour; as, how many Persons he was, how many Natures he had. And thus it continued till the time of Charlemain, when he and Pope Leo the third divided the Power of the Empire into Temporal and Spiritual.

A.

A very unequal division.

B.

Why? Which of them think you had the greater share?

A.

No doubt, the Emperour: For he onely had the Sword.

B.

When the Swords are in the hands of men, whether had you rather command the Men or the Swords?

A.

I understand you. For he that hath the hands of the Men, has also the use both of their Swords and strength.

B.

The Empire thus divided into Spiritual and Temporal, the freedom of Philosophy was to the power Spiritual very dangerous. And for that cause it behoved the Pope to get Schools set up not onely for Divinity, but also for other Sciences, especially for Natural Philosophy. Which when by the power of the Emperour he had effected, out of the mixture of Aristotle's Metaphysicks with the Scripture, there arose a new Science called School-Divinity; which has been the principal Learning of these Western parts from the time of Charlemain till of very late.

A.

But I finde not in any of the Writings of the School-men in what manner, from the causes they assigne, the Effect is naturally and necessarily produced.

B.

You must not wonder at that. For you enquire not so much, when you see a change of any thing, what may be said to be the cause of it, as how the same is generated; which generation is the entire progress of Nature from the efficient cause to the Effect produced. Which is always a hard Question, and for the most part impossible for a man to answer to. For the alterations of the things we perceive by our five Senses are made by the motion of Bodies (for the most part) either for distance, smalness, or transparence, invisible.

A.

But what need had they then to assigne any cause at all, seeing they could not shew the Effect was to follow from it?

B.

The Schools (as I said) were erected by the Pope and Emperour, but directed by the Pope onely, to answer and confute the Heresies of the Philosophers. Would you have them then betray their Profession and Authority, that is to say, their Livelihood, by confessing their ignorance? Or rather uphold the same, by putting for causes, strange and unintelligible words; which might serve well enough not onely to satisfie the people whom they relied on, but also to trouble the Philosophers themselves to finde a fault in.

A.

Seeing you say that Alteration is wrought by the Motion of Bodies, pray tell me first what I am to understand by the word Body.

B.

It is a hard Question, though most men think they can easily answer it, as that it is whatsoever they can see, feel, or take notice of by their Senses. But if you will know indeed what is body, we must enquire first what there is that is not Body. You have seen (I suppose) the Effects of Glasses, how they multiply and magnifie the Object of our sight; as when a Glass of a certain Figure will make a Counter or a Shilling seem twenty, though you be well assured there is but one. And if you set a mark upon it, you will finde the

mark upon them all. The Counter is certainly one of those things we call Bodies: Are not the others so too?

A.

No, without doubt. For looking through a Glass cannot make them really more than they are.

B.

What then be they but fancies, so many fancies of one and the same thing in several places?

A.

'Tis manifest they are so many Idols, mere Nothings.

B.

When you have look'd upon a Star or Candle with both your eyes, but one of them a little turn'd awry with your finger, has not there appeared two Stars, or two Candles? And though you call it a deception of the sight, you cannot deny but there were two Images of the Object.

A.

'Tis true, and observed by all men. And the same I say of our faces seen in Lookingglasses, and of all Dreams, and of all Apparitions of dead mens Ghosts; and wonder, since 'tis so manifest, I never thought upon't before, for it is a very happy encounter, and such as being by every body well understood, would utterly destroy both Idolatry and Superstition, and defeat abundance of Knaves that cheat and trouble the world with their devices.

B.

But you must not hence conclude that whosoever tells his Dream, or sometimes takes his direction from it, is therefore an Idolater, or Superstitious, or a Cheater. For God doth often admonish men by Dreams of what they ought to do; yet men must be wary in this case that they trust not Dreams with the conduct of their lives further than by the Laws of their Country is allow'd: For you know what God says, Deut. 13. If a Prophet or a Dreamer of Dreams give thee a signe or a wonder, and the signe come to pass, yet if he did thee serve other Gods, let him be put to death. Here by serving other Gods (since they had chosen God for their King) we are to understand revolting from their King, or disobeying of his Laws. Otherwise I see no Idolatry nor Superstition in following a Dream, as many of the Patriarches (in the Old Testament) and of the Saints (in the New Testament) did.

A.

Yes: Their own Dreams. But when another man shall dream, or say that he has dream'd, and require me to follow that, he must pardon me if I ask him by what Authority, especially if he look I should pay him for it.

B.

But if commanded by the Laws you live under, you ought to follow it. But when there proceed from one Sound divers Echoes, what are those Echoes? And when with fingers cross'd you touch a small Bullet, and think it two; and when the same Herb or Flower smells well to one and ill to another, and the same at several times, well and ill to your self, and the like of Tastes, what are those Echoes, Feelings, Odours, and Tastes?

A.

'Tis manifest they are all but Fancies. But certainly when the Sun seems to my eye no bigger than a Dish, there is behinde it somewhere somewhat else (I suppose a real Sun) which creates those fancies, by working (one way or other) upon my eyes, and other Organs of my Senses, to cause that diversity of Fancy.

B.

You say right; and that is it I mean by the word Body, which briefly I define to be any thing that hath a Being in it self, without the help of Sense.

A.

Aristotle (I think) meaneth by Body, Substance, or Subjectum, wherein Colour, Sound, and other Fancies are (as he says) inherent. For the word Essence has no affinity with Substance. And Seneca says, he understands it not. And no wonder: for Essence is no part of the Language of mankind, but a word devised by Philosophers out of the Copulation of two names, as if a man having two Hounds could make a third (if 'twere need) of their Couples.

B.

'Tis just so. For having said in themselves (for example) A Tree is a Plant, and conceiving well enough what is the signification of those Names, knew not what to make of the word Is that couples those Names; nor daring to call it a Body, they called it by a new name, (derived from the word *est*) *Essentia*, and *Substantia*, deceived by the Idiom of their own Language. For in many other Tongues, and namely in the Hebrew, there is no such

Copulative. They thought the Names of things sufficiently connected, when they are placed in their natural consequence; and were therefore never troubled with Essences, nor other Fallacy from the Copulative Est.

CAP. II. OF THE PRINCIPLES AND METHOD OF NATURAL PHILOSOPHY.

A.

THIS History of the old Philosophers has not put me out of love, but out of hope of Philosophy from any of their Writings. I would therefore try if I could attain any knowledge therein by my own meditation: But I know neither where to begin, nor which way to proceed.

B.

Your desire (you say) is to know the Causes of the Effects or Phaenomena of Nature; and you confess they are Fancies, and (consequently) that they are in your self; so that the Causes you seek for onely are without you, and now you would know how those external Bodies work upon you to produce those Phaenomena. The beginning therefore of your enquiry ought to be at What it is you call a Cause, I mean an Efficient Cause: For the Philosophers make four kindes of Causes, whereof the Efficient is one. Another they call the Formal Cause, or simply the form or essence of the thing caused; as when they say, Four equal Angles and four equal Sides are the Cause of a Square Figure, or that Heaviness is the Cause that makes heavie Bodies to descend. But that's not the Cause you seek for, nor any thing but this: It descends because it descends. The third is the Material Cause, as when they say, The Walls and Roof, &c. of a house, are the cause of a House. The fourth is the Final Cause, and hath place onely in Moral Philosophy.

A.

We will think of Final Causes upon some other occasion; of Formal and Material not at all: I seek onely the Efficient, and how it acteth from the beginning to the production of the Effect.

B.

I say then, that in the first place you are to enquire diligently into the nature of Motion. For the variations of Fancies, or (which is the same thing) of the Phaenomena of Nature, have all of them one Universal Efficient Cause, namely the variety of Motion. For if all things in the world were absolutely at rest, there could be no variety of Fancy, but living Creatures would be without sense of all Objects, which is little less than to be dead.

A.

What if a Childe new taken from the Womb should with open eyes be exposed to the Azure-Sky, do not you think it would have some sense of the Light, but that all would seem unto him Darkness?

B.

Truly, if he had no memory of any thing formerly seen, or by any other sense perceived (which is my supposition) I think he would be in the dark. For Darkness is Darkness, whether it be black or blue, to him that cannot distinguish.

A.

Howsoever that be, it is evident enough that whatsoever worketh is moved: for Action is Motion.

B.

Having well considered the nature of Motion, you must thence take your Principles for the foundation and beginning of your Enquiry.

A.

As how?

B.

Explain as fully and as briefly as you can what you constantly mean by Motion; which will save your self as well as others from being seduced by Aequivocation.

A.

Then I say, Motion is nothing but change of place: For all the Effect of a Body upon the Organs of our Senses is nothing but Fancy. Therefore we can fancy nothing from seeing it moved, but change of place.

B.

'Tis right. But you must then tell me also what you understand by Place: For all men are not yet agreed on that.

A.

Well then; seeing we fancy a Body, we cannot but fancy it somewhere. And therefore I think Place is the fancy of Here or There.

B.

That is not enough. Here and There are not understood by any but your self, except you point towards it. But pointing is no part of a Definition. Besides,

though it help him to finde the Place, it will never bring him to it.

A.

But seeing Sense is Fancy, when we fancy a Body, we fancy also the Figure of it, and the space it fills up. And then I may define Place to be The precise space within which the Body is contained. For Space is also part of the Image we have of the Object seen.

B.

And how define you Time?

A.

As Place is to a Body, so (I think) is Time to the Motion of it; and consequently I take Time to be our fancy or Image of the Motion. But is there any necessity of so much niceness?

B.

Yes. The want of it is the greatest, if not the onely cause, of all the discord amongst Philosophers, as may easily be perceived by their abusing and confounding the names of things that differ in their nature; as you shall see when there is occasion to recite some of the Tenets of divers Philosophers.

A.

I will avoid Aequivocation as much as I can. And for the nature of Motion, I suppose I understand it by the Definition. What is next to be done?

B.

You are to draw from these Definitions, and from whatsoever Truth else you know by the light of Nature, such general Consequences as may serve for Axiomes, or Principles of your Ratiocination.

A.

That is hard to do.

B.

I will draw them my self, as many as for our present discourse of Natural Causes we shall have need of; so that your part will be no more than to take heed I do not deceive you.

A.

I will look to that.

B.

My first Axiome then shall be this: Two Bodies, at the same Time, cannot be in one Place.

A.

That's true: For we number Bodies as we fancy them distinct, and distinguish them by their Places. You may therefore adde, Nor one Body at the same time in two Places. And Philosophers mean the same, when they say, There is no penetration of Bodies.

B.

But they understand not their own words: For penetration signifies it not.

My second Axiome is, That nothing can begin, change, or put an end to its own Motion. For supposing it begin just now, or being now in Motion, change its Way or Stop; I require the Cause why now rather than before or after, having all that is necessary to such Motion, Change, or Rest, alike at all times.

A.

I do not doubt but the Argument is good in Bodies inanimate; but perhaps in Voluntary Agents it does not hold.

B.

How it holds in Voluntary Agents we will then consider when our Method hath brought us to the Powers and Passions of the minde.

A third Axiome shall be this: Whatsoever Body being at Rest is afterwards moved, hath for its Immediate Movent some other Body which is in Motion and toucheth it. For, since nothing can move it self, the Movent must be external. And because Motion is change of place, the Movent must put it from its place, which it cannot do till it touch it.

A.

That is manifest, and that it must more than touch it, it must also follow it. And if more parts of the Body are moved than are by the Movent touched, the Movent is not Immediate. And by this reason, a continued Body though never so great, if the first Superficies be prest never so little back, the Motion will proceed through it.

B.

Do you think that to be impossible? I will prove it from your own words: For you say that the Movent does then touch the Body which it moveth. Therefore it puts it back; But that which is put back, puts back the next behinde, and that again the next; and so onward to any distance, the body being continued. The same is also manifest by experience, seeing one that walks with a Staff can distinguish (though blinde) between Stone and Glass; which were impossible, if the parts of his Staff between the ground and his hand made no resistance. So also he that in the silence of the night lays his Ear to the ground, shall hear the treading of mens feet further than if he stood upright.

A.

This is certainly true of a Staff or other hard Body, because it keeps the Motion in a straight Line from diffusion. But in such a Fluid Body as the Air, which being put back must fill an Orb, and the further it is put back, the greater Orb, the Motion will decrease, and in time, by the resistance of Air to Air, come to an end.

B.

That any Body in the world is absolutely at Rest, I think not true: But I grant, that in a space filled every where with Body, though never so Fluid, if you give Motion to any part thereof, that Motion will by resistance of the parts moved, grow less and less, and at last cease; but if you suppose the space utterly void, and nothing in it, then whatsoever is once moved shall go on eternally: Or else that which you have granted is not true, viz. That nothing can put an end to its own Motion.

A.

But what mean you by resistance?

B.

Resistance is the Motion of a Body in a way wholly or partly contrary to the way of its Movent, and thereby repelling or retarding it. As when a man runs swiftly, he shall feel the Motion of the Air in his face. But when two hard Bodies meet, much more may you see how they abate each others Motion, and rebound from one another. For in a space already full, the Movent cannot, in an instant, be communicated through the whole depth of the Body that is to be moved.

A.

What other Definitions have I need of?

B.

In all Motion, as in all Quantity, you must take the beginning of your reckoning from the least supposed Motion. And this I call the first Endeavour of the Movent; which Endeavour, how weak soever, is also Motion. For if it have no Effect at all, neither will it do any thing though doubled, trebled, or by what number soever multiplied: For Nothing, though multiplied, is still Nothing. Other Axiomes and Definitions we will take in, as we need them, by the way.

A.

Is this all the preparation I am to make?

B.

No, you are to consider also the several kinds and properties of Motion, viz. when a Body being moved by one or more Movents at once, in what way it is carried, straight, circular, or otherwise crooked; and what degree of swiftness; as also the action of the Movent, whether Trusion, Vection, Percussion, Reflexion, or Refraction; and further you must furnish your self with as many experiments (which they call Phaenomenon) as you can. And supposing some Motion for the Cause of your Phaenomenon, try if by evident Consequence, without contradiction to any other manifest truth or experiment, you can derive the Cause you seek for from your Supposition. If you can, 'tis all that is expected (as to that one Question) from Philosophy. For there is no Effect in Nature which the Author of Nature cannot bring to pass by more ways than one.

A.

What I want of Experiments you may supply out of your own store, or such Natural History as you know to be true; though I can be well content with the knowledge of the Causes of those things which every Body sees commonly produced. Let us therefore now enquire the Cause of some Effect particular.

B.

We will begin with that which is the most universal, the Universe, and enquire in the first place, if any place be absolutely empty, that is to say in the language of Philosophers, whether there be any Vacuum in Nature.

CAP. III. OF VACUUM.

A.

'TIS hard to suppose, and harder to believe that the Infinite and Omnipotent Creator of all things should make a work so vast as is the world we see, and leave a few little spaces with nothing at all in them; which put altogether in respect of the whole Creature, would be insensible.

B.

Why say you that? Do you think any Argument can be drawn from it to prove there is Vacuum?

A.

Why not? For in so great an Agitation of Natural Bodies, may not some small parts of them be cast out, and leave the places empty from whence they were thrown?

B.

Because he that created them is not a Fancy, but the most real substance that is; who being Infinite, there can be no place empty where he is, nor full where he is not.

A.

'Tis hard to answer this Argument, because I do not remember that there is any Argument for the maintenance of Vacuum in the writings of Divines:

Therefore I will quit that Argument, and come to another. If you take a Glass Vial with a narrow neck, and having suckt it, dip it presently at the neck into a bason of water, you shall manifestly see the water rise into the Vial. Is not this a certain signe that you had suckt out some of the Air, and consequently that some part of the Vial was left empty?

B.

No: For when I am about to suck, and have Air in my mouth, contracting my Cheeks I drive the same against the Air in the Glass, and thereby against every part of the sides of the hard Glass. And this gives to the Air within an Endeavour outward, by which (if it be presently dipt into the water) it will penetrate and enter into it. For Air if it be prest will enter into any Fluid, much more into water. Therefore there shall rise into the Vial so much water as there was Air forced into the Bason.

A.

This I confess is possible, and not improbable.

B.

If sucking would make Vacuum, what would become of those women that are Nurses? Should they not be in a very few days exhausted, were it not that either the Air which is in the Childs mouth penetrateth the Milk as it descends, and passeth through it, or the Breast is contracted?

A.

From what Experiment can you evidently infer that there is no Vacuum?

B.

From many, and such as to almost all men are known and familiar. If two hard Bodies, flat and smooth, be joyned together in a common Superficies parallel to the Horizontal Plain, you cannot without great force pull them asunder, if you apply your force perpendicularly to the common Superficies: But if you place that common Superficies erect to the Horizon, they will fall asunder with their own weight. From whence I argue thus: Since their Contiguity, in what posture soever, is the same, and that they cannot be pull'd asunder by a perpendicular force without letting in the ambient Air in an instant, which is impossible; or almost in an instant, which is difficult: and on the other side, when the common Superficies is erect, the weight of the same hard Bodies are able to break the Contiguity, and let in the Air successively, it is manifest that the difficulty of Separation proceeds from this, that neither Air nor any other Body can be moved to any (how small soever) distance in an instant; but may easily be moved (the hardness at the sides once mastered) successively. So that the Cause of this difficulty of Separation is this, that they cannot be parted except the Air or other matter can enter and fill the space made by their diremption. And if they were infinitely hard, not at all. And hence also you may understand the Cause why any hard Body, when it is suddenly broken, is heard to crack; which is the swift Motion of the Air to fill the space between.

Another Experiment, and commonly known, is of a Barrel of Liquor, whose Tap-hole is very little, and the Bung so stopt as to admit no Air; for then the Liquor will not run: but if the Tap-hole be large it will, because the Air prest by a heavier Bodie will pierce through it into the Barrel. The like reason holds of a Gardeners Watering-pot, when the holes in the bottom are not too great. A third Experiment is this: Turn a thin Brass kettle the bottom upwards, and lay it flat upon the Water. It will sink till the water rise within to a certain height, but no higher: Yet let the bottom be perforated, and the Kettle will be full and sink, and the Air rise again through the water

without. But if a Bell were so laid on, it would be fill'd and sink, though it were not perforated, because the weight is greater than the weight of the same bulk of water.

A.

By these Experiments, without any more, I am convinced, that there is not actually in Nature any Vacuum; but I am not sure but that there may be made some little place empty, and this from two Experiments, one whereof is Torricellius his Experiment, which is this: Take a Cylinder of Glass, hollow throughout, but close at the end, in form of a Sack.

B.

How long?

A.

As long as you will, so it be more than 29 inches.

B.

And how broad?

A.

As broad as you will, so it be broad enough to pour into it Quicksilver. And fill it with Quicksilver, and stop up the Entrance with your finger, so as to unstop it again at your pleasure. Then set down a Bason, or (if you will) a Sea of Quicksilver, and inverting the Cylinder full as it is, dip the end into the Quicksilver, and remove your finger, that the Cylinder may empty itself. Do you conceive me? For there is so many passing by, that I cannot paint it.

B.

Yes, I conceive you well enough. What follows?

A.

The Quicksilver will descend in the Cylinder, not till it be level with that in the Bason according to the nature of heavie Fluids, but stay and stand above it at the height of 29 inches or very neer it, the bottom being now uppermost that no Air can get in.

B.

What do you infer from this?

A.

That all the Cavities above 29 inches is fill'd with Vacuum.

B.

'Tis very strange that I, from this same Experiment, should infer (and I think evidently) that it is fill'd with Air. I pray, tell me, when you had inverted the Cylinder, full as it was, and stopt with your finger, dipt into the Bason, if you had then removed your finger, whether you think the Quicksilver would not all have fallen out?

A.

No sure. The Air would have been prest upward through the Quicksilver it self: For a man with his hand can easily thrust a Bladder of Air to the bottom of a Bason of Quicksilver.

B.

It is therefore manifest that Quicksilver can press the Air through the same Quicksilver.

A.

'Tis manifest; and also it self rise into the Air.

B.

What cause then can there be, why it should stand still at 29 inches above the level of the Bason, rather than any place else?

A.

'Tis not hard to assigne the cause of that. For so much Quicksilver as was above the 29 inches, will raise the first level of that in the bason, as much as if you had pour'd it on; and thereby bring it to an Aequilibrium. So that I see plainly now, that there is no necessity of Vacuum from this Experiment. For I considered onely that naturally Quicksilver cannot ascend in Air, nor Air descend in Quicksilver, though by force it may.

B.

Nor do I think that Torricellius or any other Vacuist thought of it more than you. But what is the second Experiment?

A.

There is a Sphere of Glass, which they call a Recipient, of the Capacity of three or four Gallons. And there is inserted into it the end of a hollow Cylinder of Brass above a foot long; so that the whole is one Vessel, and the

bore of the Cylinder three inches Diameter. Into which is thrust by force a solid Cylinder of Wood, covered with leather so just, as it may in every point exactly touch the Concave Superficies of the Brass. There is also to let out the Air which the wooden Cylinder as it enters (called the Sucker) drives before it, a Flap to keep out the External Air while they are pulling the Sucker. Besides, at the top of the Recipient there is a hole to put into it any thing for Experiment. The Sucker being now forc'd up into the Cylinder, what do you think must follow?

B.

I think it will require as much strength to pull it back, as it did to force it in.

A.

That is not it I ask, but what would happen to the Recipient.

B.

I think so much Air as would fill the place the Sucker leaves, would descend into it out of the Recipient; and also that just so much from the External Air would enter into the Recipient, between the Brass and the Wood, at first very swiftly, but, as the place increased, more leasurely.

A.

Why may not so much Air rather descend into the place forsaken, and leave as much Vacuum as that comes to, in the Recipient? For otherwise no Air will be pumpt out; nor can that wooden Pestle be called a Sucker.

B.

That's it I say. There is no Air either pumpt or sucked out.

A.

How can the Air pass between the Leather and the Brass, or between the Leather and the Wood being so exactly contiguous, or through the Leather it self?

B.

I conceive no such exact contiguity, nor such fastness of the Leather: For I never yet had any that in a storm would keep out either Air or Water.

A.

But how then could there be made in the Recipient such strange alteration both on animate and inanimate Bodies?

B.

I will tell you how: The Air descends out of the Recipient, because the Air which the Sucker removeth from behinde it self as it is pulling out, has no place to retire into without. And therefore is driven into the Engine between the wood of the Sucker and the brass of the Cylinder, and causes as much Air to come into the place forsaken by the retiring Sucker; which causeth by oft repetition of the force, a violent circulation of the Air within the Recipient, which is able quickly to kill any thing that lives by respiration, and make all the alterations that have appeared in the Engine.

CAP. IV. OF THE SYSTEME OF THE WORLD.

B.

YOU are come in good time; let us therefore sit down. There is Ink, Paper, Ruler, and Compass. Draw a little Circle to represent the Body of the Sun.

A.

'Tis done. The Centre is A, the Circumference is L M.

B.

Upon the same Centre A, draw a larger Circle to stand for the Ecliptick: For you know the Sun is always in the Plain of the Ecliptick.

A.

There 'tis. The Diameters of it at right Angles are B Z.

B.

Draw the Diameter of the Aequator.

A.

How?

B.

Through the Centre A (for the Earth is also always in the Plain of the Aequator or of some of its Parallels) so as to be distant from B 23 deg. and a half.

A.

Let it be H I: And let C G be equal to B H; and so G will be one of the Poles of the Ecliptick, suppose the North-Pole; and then H will be East, and I West. And C A produced to the Circumference in E, makes E the South-Pole.

B.

Take C K equal to C G, and the Chord G K will be the Diameter of the Arctick-Circle, and parallel to H I, the Diameter of the Aequator. Lastly, upon the point B, draw a little Circle wherein I suppose to be the Globe of the Earth.

A.

'Tis drawn, and marked with l m. And B D and K G joyned will be parallel; and as H and I are East and West, and so are B and D, and G and K.

B.

True; but producing Z B to the Circumference l m in b, the Line B b will be in the Diameter of the Ecliptick of the Earth, and B m in the Diameter of the Aequator of the Earth. In like manner, if you produce K G cutting the Circle, whose Centre is G, in d and e, and make an Angle n G d equal to b B m, the Line n G will be in the Ecliptick of the Earth, because G d is in the Aequator of the Earth. So that in the Annual Motion of the Earth through

the Ecliptick, every streight Line drawn in the Earth, is perpetually kept parallel to the place from whence it is removed.

A.

'Tis true; and 'tis the Doctrine of Copernicus. But I cannot yet conceive by what one Motion this Circle can be described otherwise than we are taught by Euclid. And then I am sure that all the Diameters shall cross one another in the Centre, which in this Figure is A.

B.

I do not say that the Diameters of a Sphere or Circle can be parallel; but that if a Circle of a lesser Sphere be moved upon the Circumference of a great Circle of a greater Sphere, that the streight Lines that are in the lesser Sphere may be kept parallel perpetually to the places they proceed from.

A.

How? And by what Motion?

B.

Take into your hand any streight Line, (as in this Figure) the Line L A M, which we suppose to be the diameter of the Suns Body; and moving it parallelly, with the ends in the Circumference, so as that the end M may withal describe a small Circle, as M a. It is manifest that all the other points of the same Line L M will by the same Motion, at the same time, describe equal Circles to it. Likewise if you take in your hand any two Diameters fastened together, the same Parallel-motion of the line L M, shall cause all the points of the other Diameter to make equal Circles to the same M a.

A.

'Tis evident; as also that every point of the Suns body shall do the like. And not onely so, but also if one end describe any other Figure, all the other points of the Body shall describe like and equal Figures to it.

B.

You see by this, that this Parallel-motion is compounded of two Motions, one Circular upon the Superficies of a Sphere, the other a streight Motion from the Centre to every point of the same Superficies, and beyond it.

A.

I see it.

B.

It follows hence, that the Sun by this Motion must every way repel the Air; and since there is no empty place for retiring, the Air must turn about in a Circular stream; but slower or swifter according as it is more or less remote from the Sun, and that according to the nature of Fluids, the Particles of the Air must continually change place with one another; and also that the stream of the Air shall be the contrary way to that of the Motion, for else the Air cannot be repelled.

A.

All this is certain.

B.

Well. Then if you suppose the Globe of the Earth to be in this stream which is made by the Motion of the Suns Body from East to West, the stream of Air wherein is the Earths Annual Motion will be from West to East.

A.

'Tis certain.

B.

Well. Then if you suppose the Globe of the Earth, whose Circle is moved Annually, to be $l\ m$, the stream of the Air without the Ecliptick falling upon the Superficies of the Earth $l\ m$ without the Ecliptick, being slower, and the stream that falleth within swifter, the Earth shall be turned upon its own Centre proportionally to the greatness of the Circles; and consequently their Diameters shall be parallel; as also are other streight Lines correspondent.

A.

I deny not but the streams are as you say; and confess that the proportion of the swiftness without, is to the swiftness within, as the Suns Ecliptick to the Ecliptick of the Earth; that is to say, as the Angle HAB to the Angle $m\ B\ b$. And I like your Argument the better, because it is drawn from Copernicus his foundation. I mean the compounded Motion of Streight and Circular.

B.

I think I shall not offer you many demonstrations of Physical conclusions that are not derived from the Motions supposed or proved by Copernicus. For those Conclusions in Natural Philosophy I most suspect of falshood, which require most variety of Suppositions for their demonstrations.

A.

The next thing I would know, is how great or little you suppose that Circle a M.

B.

I suppose it less than you can make it: For there appears in the Sun no such Motion sensible. 'Tis the first Endeavour of the Suns Motion. But for all that, as small as the Circle is, the Motion may be as swift, and of as great strength as 'tis possible to be named. 'Tis but a kinde of trembling that necessarily happeneth in those Bodies, which with great resistance press upon one another.

A.

I understand now from what Cause proceedeth the Annual Motion: Is the Sun the Cause also of the Diurnal Motion?

B.

Not the immediate Cause. For the Diurnal Motion of the Earth is upon its own Centre, and therefore the Suns Motion cannot describe it. But it proceedeth as a necessary consequence from the Annual Motion. For which I have both experience and demonstration. The Experiment is this: Into a large Hemisphere of Wood, spherically Concave, put in a Globe of Lead, and with your hands hold it fast by the brim, moving your hands circularly, but in a very small compass, you shall see the Globe circulate about the Concave Vessel, just in the same manner as the Earth doth every year in the Air; and you shall see withal, that as it goes, it turns perpetually upon its own Centre, and very swiftly.

A.

I have seen it: And 'tis used in some great Kitchens to grinde Mustard.

B.

Is it so? Therefore take a Hemisphere of Gold (if you have it) the greater the better, and a Bullet of Gold, (and without Mustard) you shall see the same Effect.

A.

I doubt it not. But the of it Cause is evident. For any Spherical Body being in Motion upon the sides of a Concave and hard Sphere, is all the way turned upon its own Centre by the resistance of the hard Wood or Metal. But the Earth is a Bullet without weight, and meeteth onely with Air, without any harder body in the way to resist it.

B.

Do you think the Air makes no resistance, especially to so swift a Motion as is the Annual Motion of the Earth? If it do make any resistance, you cannot doubt but that it shall turn the Earth circularly, and in a contrary way to its Annual Motion; that is to say, from East to West, because the Annual Motion is from West to East.

A.

I confess it. But what deduce you from these Motions of the Sun?

B.

I deduce (first) that the Air must of necessity be moved both circularly about the Body of the Sun according to the Ecliptick, and also every way directly from it. For the Motion of the Suns Body is compounded of this Circular Motion upon the Sphere L M, and of the streight motion of its Semi-diameters from the Centre A to the Superficies of the Suns Body, which is LM. And therefore the Air must needs be repelled every way, and also continually change place to fill up the places forsaken by other parts of the Air, which else would be empty, there being no Vacuum to retire unto. So that there would be a perpetual stream of Air, and in a contrary way to the Motion of the Suns Body, such as is the Motion of Water by the sides of a Ship under sail.

A.

But this Motion of the Earth from West to East, is onely Circular, such as is described by a Compass about a Centre; and cannot therefore repel the Air as the Sun does. And the Disciples of Copernicus will have it to be the Cause of the Moons monthly motion about the Earth.

B.

And I think Copernicus himself would have said the same, if his purpose had been to have shewn the Natural Causes of the Motions of the Stars. But that was no part of his designe; which was onely from his own observations, and those of former Astronomers, to compute the times of their Motions; partly to foretel the Conjunctions, Oppositions, and other Aspects of the Planets; and partly to regulate the times of the Churches Festivals. But his followers, Kepler and Galileo, make the Earths Motion to be the Efficient Cause of the Monthly motion of the Moon about the Earth; which without the like Motion to that of the Sun in LM, is impossible. Let us therefore for the present take it in as a necessary Hypothesis; which from some

Experiment that I shall produce in our following discourses, may prove to be a certain truth.

A.

But seeing A is the Centre both of the Suns Body and of the Annual Motion of the Earth, How can it be (as all Astronomers say it is) that the Orb of the Annual Motion of the Earth should be Excentrique to the Suns Body? For you know that from the Vernal Aequinox to the Autumnal, there be 187 days; but from the Autumnal Aequinox to the Vernal, there be but 178 days. What Natural Cause can you assigne for this Excentricity?

B.

Kepler ascribes it to a Magnetique vertue, viz. that one part of the Earths Superficies has a greater kindness for the Sun than the other part.

A.

I am not satisfied with that. It is Magical rather than Natural, and unworthy of Kepler. Tell me your own opinion of it.

B.

I think that the Magnetical vertue he speaks of, consisteth in this: that the Southern Hemisphere of the Earth is for the greatest part Sea, and that the greatest part of the Northern Hemisphere is dry Land. But how it is possible that from thence should proceed the Excentricity (the Sun being nearest to the Earth, when he is in the Winter-Solstice) I shall shew you when we come to speak of the Motions of Air and Water.

A.

That's time enough: For I intend it for our next meeting. In the mean time I pray you tell me what you think to be the Cause why the Equinoctial (and consequently the Solstitial) points are not always in one and the same point of the Ecliptique of the Fixt Stars. I know they are not, because the Sun does not rise and set in points diametrically opposite: For if it did, there would be no difference of the Seasons of the year.

B.

The cause of that can be no other, than that the Earth (which is l m) hath the like Motion to that which I suppose the Sun to have in L M, compounded of streight and circular from West to East in a day, as the Annual Motion hath in a year; so that (not reckoning the Excentricity) it will be moved through the Ecliptiques one Revolution (as Copernicus proveth) about one degree. Suppose then the whole Earth moved from H to I, (which is half the year) circularly, but falling from I to i in the same time about 30 minutes, and as much in the other Hemisphere from H to k; then draw the line i k, which will be equal and parallel to H I, and be the Diameter of the Aequator for the next year. But it shall not cut the Diameter of the Ecliptick B Z in A, which was the Equinoctial of the former year, but in o 36 seconds from the first degree of Aries. Suppose the same done in the Hemisphere under the Plain of the paper, and so you have the double of 36 seconds, that is 72 seconds, or very neer, for the progress of the Vernal Equinox in a year. The cause why I suppose the Arch I i to be half a degree in the Ecliptique of the Earth, is, that Copernicus and other Astronomers, and Experience, agree in this, that the Aequinoctial points proceed according to the order of the Signes, Aries, Taurus, Gemini, &c. from West to East every 100 year one degree or very neer.

A.

In what time do they make the whole Revolution through the Ecliptique of the Sky?

B.

That you may reckon. For we know by Experience that it hath proceeded about one degree, that is 60 minutes constantly a long time in a hundred years. But as 100 years to one degree, so is 36000 years to 360 degrees. Also as 100 years to one degree, so is one year to the hundred part of one degree or 60 minutes; which is $60/100$, or 36 seconds for the progress of one year; which must be somewhat more than a degree according to Copernicus, who, lib. 3. ca. saith, That for 400 years before Ptolomie it was one degree almost constantly. Which is well enough as to the Natural Cause of the Precession of the Aequinoctial points, which is the often-said compounded Motion, though not an exact Astronomical Calculation.

A.

And 'tis a great signe that his Supposition is true. But what is the Cause that the Obliquity of the Ecliptique, that is, the distance between the Aequinoctial and the Solstice, is not always the same?

B.

The necessity of the Obliquity of the Ecliptique is but a consequence to the Precession of the Aequinoctial points. And therefore if from C the North-Pole you make a little Circle C u equal to 15 minutes of a degree upon the Earth, and another u s equal to the same, which will appear like this Figure 8, that is (as Copernicus calls it) a Circle twined, the Pole C will be moved half the time of the Aequinoctial points, in the arc C u, and as much in the alternate arc u s descending to s. But in the arc s u, and its alternate rising to

C. The cause of the twining is the Earths Annual Motion the same way in the Ecliptique, and makes the four quarters of it; and makes also their revolution twice as slow as that of the Aequinocstial points. And therefore the Motion of it is the same compounded Motion which Copernicus takes for his Supposition, and is the cause of the Precession of the Aequinocstial points, and consequently of the variation of the Obliquity, adding to it or taking from it somewhere more, somewhere less; so as that one with another the addition is not much more, nor the subtraction much less than 30 minutes. But as for the Natural Efficient cause of this compounded Motion, either in the Sun, or the Earth, or any other Natural Body, it can be none but the immediate hand of the Creator.

A.

By this it seems that the Poles of the Earth are always the same, but make this 8 in the Sphere of the fixt Stars neer that which is called Cynosura.

B.

No: 'Tis described on the Earth, but the Annual Motion describes a Circle in the Sphere of the fixed Stars. Though I think it improper to say a Sphere of the fixt Stars, when 'tis so unlikely that all the fixt Stars should be in the Superficies of one and the same Globe.

A.

I do not believe they are.

B.

Nor I, since they may seem less one than another, as well by their different distances, as by their different magnitudes. Nor is it likely that the Sun

(which is a fixt Star) is the Efficient Cause of the Motion of those remoter Planets, Mars, Jupiter, and Saturn; seeing the whole Sphere, whose Diameter is the distance between the Sun and the Earth, is but a point in respect of the distance between the Sun and any other fixed Star. Which I say onely to excite those that value the knowledge of the Cause of Comets, to look for it in the Dominion of some other Sun than that which moveth the Earth. For why may not there be some other fixed Star, neerer to some Planet than is the Sun, and cause such a light in it as we call a Comet?

A.

As how?

B.

You have seen how in high and thin Clouds above the Earth, the Sun-beams piercing them have appeared like a Beard; and why might not such a Beard have appeared to you like a Comet, if you had lookt upon it from as high as some of the fixed Stars?

A.

But because it is a thing impossible for me to know, I will proceed in my own way of enquiry. And seeing you ascribe this compounded Motion to the Sun and Earth, I would grant you that the Earth (whose Annual Motion is from West to East) shall give the Moon her Monthly-motion from East to West. But then I ask you whether the Moon have also that compounded Motion of the Earth, and with it a Motion upon its own Centre, as hath the Earth? For seeing the Moon has no other Planet to carry about her, she needs it not.

B.

I see reason enough, and some necessity, that the Moon should have both those Motions. For you cannot think that the Creator of the Stars, when he gave them their Circular Motion, did first take a Centre, and then describe a Circle with a Chain or Compass, as men do? No; he moved all the parts of a Star together and equally in the Creation: And that's the reason I give you. The necessity of it, comes from this Phaenomenon, that the Moon doth turn one and the same face towards the Earth: Which cannot be by being moved about the Earth parallelly, unless also it turn about its own Centre. Besides, we know by experience, that the Motion of the Moon doth adde not a little to the Motion of the Sea: Which were impossible if it did not adde to the Stream of the Air, and by consequence to that of the Water.

A.

If you could get a piece of the true and intimate Substance of the Earth, of the bigness of a Musquet-bullet, do you believe that the Bullet would have the like compounded Motion to that which you attribute to the Sun, Earth, and Moon?

B.

Yes truly; but with less strength, according to its magnitude; saving that by its Gravity falling to the Earth, the activity of it would be unperceived.

A.

I will trouble you no more with the Nature of Celestial appearances. But I pray you tell me by what art a man may finde what part of a Circle the Diameter of the Suns Body doth subtend in the Ecliptique Circle.

B.

Kepler says it subtends 30 minutes, which is half a degree. His way to finde it is by letting in the Sun-beams into a close room through a small hole, and receiving the image of it upon a plain perpendicularly. For by this means he hath a Triangle, whose sides and angles he can know by measure; and the vertical Angle he seeks for, and the substance of the arc of the Suns Body.

A.

But I think it impossible to distinguish where the part illuminate toucheth the part not illuminate.

B.

Another way is this: Upon the Aequinoctial-day, with a Watch that shews the minutes standing by you, observe when the lower brim of the Suns setting first comes to the Horizon, and set the Index to some minute of the Watch; and observe again the upper brim when it comes to the Horizon: then count the minutes, and you have what you look for. Other way I know none.

CAP. V. OF THE MOTIONS OF WATER AND AIR.

A.

I Have considered, as you bad me, this compounded Motion with great admiration. First, it is that which makes the difference between Continuum and Contiguum, which till now I never could distinguish. For Bodies that are but Contiguous, with any little force are parted; but by this compounded Motion (because every point of the body makes an equal Line in equal time, and every Line crosses all the rest) one part cannot be separated from another, without disturbing the Motion of all the other parts at once. And is not that the Cause, think you, that some Bodies when they are prest or bent, as soon as the force is removed, return again of themselves to their former figure?

B.

Yes sure; saving that it is not of themselves that they return, (for we were agreed that nothing can move it self) but it is the Motion of the parts which are not prest, that delivers those that are. And this restitution the Learned now call the Spring of a Body. The Greeks called it Antitypia.

A.

When I considered this Motion in the Sun and the Earth and Planets, I fancied them as so many Bodies of the Army of the Almighty in an immense field of Air, marching swiftly, and commanded (under God) by his glorious Officer the Sun, or rather forced so to keep their order in every part

of every of those Bodies, as never to go out from the distance in which he had set them.

B.

But the parts of the Air and other Fluids keep not their places so.

A.

No. You told me that this Motion is not natural in the Air, but received from the Sun.

B.

True. But since we seek the Natural Causes of Sublunary Effects, where shall we begin?

A.

I would fain know what makes the Sea to ebbe and flow at certain Periods, and what causeth such variety in the Tides.

B.

Remember that the Earth turneth every day upon its own Axis from West to East; and all the while it so turneth, every point thereof by its compounded Motion makes other Circlings, but not on the same Centre, which is (you know) a rising in one part of the day, and a falling in the other part. What think you must happen to the Sea, which resteth on it, and is a Fluid Body?

A.

I think it must make the Sea rise and fall. And the same happeneth also to the Air, from the Motion of the Sun.

B.

Remember also, in what manner the Sea is situated in respect of the Dry Land.

A.

Is not there a great Sea that reacheth from the Strait of Magellan Eastward to the Indies, and thence to the same Strait again? And is not there a great Sea called the Atlantick Sea that runneth Northward to us? and does not the great South-Sea run also up into the Northern Seas? But I think the Indian and the South-Sea of themselves to be greater than all the rest of the Surface of the Globe.

B.

How lieth the water in those two Seas?

A.

East and West, and rises and falls a little, as it is forc'd to do by this compounded Motion, which is a kind of succussion of the Earth, and fills both the Atlantick and Northern Seas.

B.

All this would not make a visible difference between High and Low water, because this Motion being so regular, the unevenness would not be great

enough to be seen. For though in a Bason the water would be thrown into the Air, yet the Earth cannot throw the Sea into the Air.

A.

Yes. The Bason, if gently moved, will make the water so move, that you shall hardly see it rise.

B.

It may be so. But you should never see it rise as it doth, if it were not checkt. For at the Straight of Magellan, the great South-Sea is checkt by the shore of the Continent of Peru and Chily, and forced to rise to a great height, and made to run up into the Northern Seas on that side by the coast of China; and at the return is checkt again and forced through the Atlantick into the British and German Seas. And this is done every day. For we have supposed that the Earths Motion in the Ecliptique caused by the Sun is Annual; and that its Motion in the Aequinoctial, is Diurnal. It followeth therefore from this compounded Motion of the Earth, the Sea must Ebb and Flow twice in the space of Twenty four hours, or thereabout.

A.

Has the Moon nothing to do in this business?

B.

Yes. For she hath also the like Motion. And is, though less swift, yet much neerer to the Earth. And therefore when the Sun and Moon are in Conjunction or Opposition, the Earth, as from two Agents at once, must needs have a greater Succussion. And if it chance at the same time the

Moon also be in the Ecliptique, it will be yet greater, because the Moon then worketh on the Earth less obliquely.

A.

But when the Full or New Moon happen to be then when the Earth is in the Aequinoctial points, the Tides are greater than ordinary. Why is that?

B.

Because then the force by which they move the Sea, is at that time, to the force by which they move the same at other times, as the Aequinoctial Circle to one of its Parallels, which is a lesser Circle.

A.

'Tis evident. And 'tis pleasant to see the Concord of so many and various motions, when they proceed from one and the same Hypothesis. But what say you to the stupendious Tides which happen on the Coasts of Lincolnshire on the East, and in the River of Severn on the West?

B.

The cause of that, is their proper Scituation. For the Current of the Ocean through the Atlantick Sea, and the Current of the South-Sea through the Northern Seas meeting together, raise the water in the Irish and British Seas a great deal higher than ordinary. Therefore the mouth of the Severn being directly opposite to the Current from the Atlantick Sea, and those Sands on the Coast of Lincolnshire directly opposite to the Current of the German Sea, those Tides must needs fall furiously into them, by this Succussion of the water.

A.

Does, when the Tide runs up into a River, the water all rise together, and fall together when it goes out?

No: One part riseth and another falleth at the same time; because the Motion of the Earth rising and falling, is that which makes the Tide.

A.

Have you any Experiment that shews it?

B.

Yes. You know that in the Thames, it is high water at Greenwich before it is high water at London-bridge. The water therefore falls at Greenwich whilst it riseth all the way to London. But except the top of the water went up, and the lower part downward, it were impossible.

A.

'Tis certain. It is strange that this one Motion should salve so many apparences, and so easily. But I will produce one Experiment of water, not in the Sea, but in a Glass. If you can shew me that the cause of it is this compounded Motion, I shall go neer to think it the Cause of all other Effects of Nature hitherto disputed of. The Experiment is common, and described by the Lord Chancellour Bacon, in the third page of his Natural History. Take (saith he) a Glass of water, and draw your finger round about the lip of the Glass, pressing it somewhat hard; after you have done so a few times, it will make the water frisk up into a fine Dew. After I had read this, I tried the same with all diligence my self, and found true not onely the frisking of the water to above an inch high, but also the whole Superficies to circulate,

and withal to make a pleasant sound. The Cause of the frisking he attributes to a tumult of the inward parts of the Substance of the Glass striving to free it self from the pressure.

B.

I have tried and found both the Sound and Motion; and do not doubt but the pressure of the parts of the Glass was part of the Cause. But the Motion of my finger about the Glass was always parallel; and when it chanced to be otherwise, both Sound and Motion ceased.

A.

I found the same. And being satisfied, I proceed to other questions. How is the water (being a heavie Body) made to ascend in small particles into the Air, and be there for a time sustained in form of a Cloud, and then fall down again in Rain?

B.

I have shewn already, that this compounded Motion of the Sun, in one part of its Circumlation, drives the Air one way, and in the other part, the contrary way; and that it cannot draw it back again, no more than he that sets a stone a flying can pull it back. The Air therefore, which is contiguous to the water, being thus distracted, must either leave a Vacuum, or else some part of the water must rise and fill the spaces continually forsaken by the Air. But, that there is no Vacuum, you have granted. Therefore the water riseth into the Air, and maketh the Clouds; and seeing they are very small and invisible parts of the water, are (though naturally heavie) easily carried up and down with the Wind, till, meeting with some Mountain or other Clouds, they be prest together into greater drops, and fall by their weight.

So also it is forced up in moist ground, and with it many small Atomes of the Earth, which are either twisted with the rising water into Plants, or are carried up and down in the Air incertainly. But the greatest Quantity of Water is forced up from the great South and Indian Seas, that lie under the Tropique of Capricorn. And this Climate is that which makes the Suns Perigaeum to be always on the Winter-Solstice. And that is the part of the Terrestrial Globe which Keplerus says is kinde to the Sun; whereas the other part of the Globe (which is almost all dry land) has an Antipathy to the Sun. And so you see where this Magnetical vertue of the Earth lies. For the Globe of the Earth having no Natural Appetite to any place, may be drawn by this Motion of the Sun a little neerer to it, together with the water which it raiseth.

A.

Can you guess what may be the Cause of Wind?

B.

I think it manifest that the unconstant Winds proceed from the uncertain Motion of the Clouds ascending and descending, or meeting with one another. For the Winds after they are generated in any place by the descent of a Cloud, they drive other Clouds this way and that way before them, the Air seeking to free it self from being pent up in a straight. For when a Cloud descendeth, it makes no wind sensible directly under it self. But the Air between it and the Earth is prest and forced to move violently outward. For it is a certain Experiment of Mariners, that if the Sea go high when they are becalmed, they say they shall have more Wind than they would; and take in their Sails all but what is necessary for steering. They know (it seems) that the Sea is moved by the descent of Clouds at some distance off: Which

presseth the water, and makes it come to them in great Waves. For a Horizontal Wind does but curl the Water.

A.

From whence come the Rivers?

B.

From the Rain, or from the falling of Snow on the higher ground. But when it descendeth under ground, the place where it again ariseth is called the Spring.

A.

How then can there be a Spring upon the top of a Hill?

B.

There is no Spring upon the very top of a Hill, unless some Natural Pipe bring it thither from a higher Hill.

A.

Julius Scaliger says, there is a River, and in it a Lake, upon the top of Mount Cenis in Savoy; and will therefore have the Springs to be ingendred in the Caverns of the Earth by Condensation of the Air.

B.

I wonder he should say that. I have pass'd over that Hill twice since the time I read that in Scaliger, and found that River as I pass'd, and went by the side of it in plain ground almost two miles. Where I saw the water from

two great Hills, one on one side, the other on the other, in a thousand small Rillets of melting Snow fall down into it. Which has made me never to use any Experiment the which I have not my self seen. As for the conversion of Air into Water by Condensation, and of Water into Air by Rarefaction (though it be the doctrine of the Peripatetiques) it is a thing incogitable, and the words are insignificant. For by Densum is signified onely frequencie and closeness of parts; and by Rarum the contrary. As when we say a Town is thick with houses, or a Wood with trees, we mean not that one house or tree is thicker than another, but that the spaces between are not so great. But (since there is no Vacuum) the spaces between the parts of Air are no larger than between the parts of Water, or of any thing else.

A.

What think you of those things which Mariners that have sailed through the Atlantick Sea called Spouts, which pour down water enough at once to drown a great Ship?

B.

'Tis a thing I have not seen. And therefore can say nothing to it; though I doubt not but when two very large and heavie Clouds shall be driven together by two great and contrary winds, the thing is possible.

A.

I think your reason good. And now will propound to you another Experiment. I have seen an exceeding small Tube of Glass with both ends open set upright in a Vessel of Water, and that the Superficies of the Water within the Tube was higher a good deal than of that in the Vessel; but I see no reason for it.

B.

Was not part of the Glass under Water? Must not then the Water in the Vessel rise? Must not the Air that lay upon it rise with it? Whither should this rising Air go, since there is no place empty to receive it? It is therefore no wonder if the Water, press'd by the Substance of the Glass which is dipt into it, do rather rise into a very small Pipe, than come about a longer way into the open Air.

A.

'Tis very probable. I observed also that the top of the inclosed Water was a concave Superficies; which I never saw in other Fluids.

B.

The Water hath some degree of tenacity, though not so great but that it will yield a little to the Motion of the Air; as is manifest in the Bubbles of water, where the concavity is always towards the Air. And this I think the cause why the Air and Water meeting in the Tube make the Superficies towards the Air concave, which it cannot do to a Fluid of greater tenacity.

A.

If you put into a Bason of Water a long rag of Cloth, first drenched in water, and let the longer part of it hang out, it is known by Experience, that the Water will drop out as long as there is any part of the other end under Water.

B.

The cause of it is, that water (as I told you) hath a degree of tenacity. And therefore being continued in the rag till it be lower without than within, the

weight will make it continue dropping, though not onely because it is heavie (for if the rag lay higher without than within, and were made heavier by the breadth, it would not descend) but 'tis because all heavie Bodies Naturally descend with proportion of swiftness duplicate to that of the time; whereof I shall say more when we talk of Gravity.

A.

You see how despicable Experiments I trouble you with. But I hope you will pardon me.

B.

As for mean and common Experiments, I think them a great deal better Witnesses of Nature, than those that are forced by fire, and known but to very few.

CAP. VI. OF THE CAUSES AND EFFECTS OF HEAT AND COLD.

A.

‘TIS a fine day, and pleasant walking through the Fields, but that the Sun is a little too hot.

B.

How know you that the Sun is hot?

A.

I feel it.

B.

That is to say, you know that your self, but not that the Sun is hot. But when you finde your self hot, what Body do you feel?

A.

None.

B.

How then can you infer your heat from the Sense of Feeling? Your walking may have made you hot: Is Motion therefore hot? No. You are to consider the Concomitants of your heat; as, that you are more faint, or more ruddy,

or that you sweat, or feel some Endeavour of Moisture or Spirits tending outward; and when you have found the Causes of those Accidents, you have found the Causes of Heat, which in a living Creature, and specially in a Man, is many times the Motion of the parts within him, such as happen in sickness, anger, and other passions of the minde; which are not in the Sun nor in Fire.

A.

That which I desire now to know, is what Motions and of what Bodies without me are the Efficient Causes of my Heat.

B.

I shewed you yesterday in discoursing of Rain, how by this compounded Motion of the Suns Body, the Air was every way at once thrust off West and East; so that where it was contiguous, the small parts of the water were forced to rise, for the avoiding of Vacuum. Think then that your hand were in the place of water so exposed to the Sun. Must not the Sun work upon it as it did upon the Water? Though it break not the skin, yet it will give to the inner Fluids and looser parts of your hand, an Endeavour to get forth, which will extend the skin, and in some climates fetch up the bloud, and in time make the skin black. The Fire also will do the same to them that often sit with their naked skins too neer it. Nay, one may sit so neer (without touching it) as it shall blister or break the skin, and fetch up both spirits and bloud mixt into a putrid oyly matter sooner, than in a Furnace Oyl can be extracted out of a Plant.

A.

But if the Water be above the Fire in a Kettle, what then will it do? Shall the particles of water go toward the Fire, as it did toward the Sun?

B.

No. For it cannot. But the Motion of the parts of the Kettle which are caused by the Fire, shall dissipate the Water into Vapour till it be all cast out.

A.

What is that you call Fire? Is it a hard or Fluid Body?

B.

It is not any other Body but that of the shining coal; which coal, though extinguished with Water, is still the same Body. So also in a very hot Furnace, the hollow spaces between the shining coals, though they burn that you put into them, are no other Body than Air moved.

A.

Is it not Flame?

B.

No. For flame is nothing but a multitude of Sparks, and Sparks are but the Atomes of the Fewel dissipated by the incredible swift Motion of the Movent, which makes every Spark to seem a hundred times greater than it is, as appears by this; That when a man swings in the Air a small stick fired at one end (though the Motion cannot be very swift) yet the Fire will appear to the eye to be a long, streight, or crooked Line. Therefore a great many

sparks together flying upward, must needs appear unto the sight as one continued Flame. Nor are the sparks stricken out of a Flint any thing else but small particles of the stone, which by their swift Motion are made to shine. But that Fire is not a substance of it self, is evident enough by this, that the Sun-beams passing through a Globe of Water will burn as other fire does. Which beams, if they were indeed Fire, would be quenched in the passage.

A.

This is so evident, that I wonder so wise men as Aristotle and his followers, for so long a time could hold it for an Element, and one of the primary parts of the Universe. But the Natural heat of a man or other living Creature, whence proceedeth it? Is there any thing within their Bodies that hath this compounded Motion?

B.

At the breaking up of a Deer I have seen it plainly in his Bowels as long as they were warm. And it is called the Peristaltique Motion, and in the Heart of a Beast newly taken out of his Body; and this Motion is called Systole and Diastole. But they are both of them this compounded Motion, whereof the former causeth the food to Winde up and down through the guts, and the later makes the Circulation of the Blood.

A.

What kind of Motion is the Cause of Cold? Methinks it should be contrary to that which causeth Heat.

B.

So it is in some respect. For seeing the Motion that begets Heat, tendeth to the separation of the parts of the Body whereon it acteth, it stands with reason, that the Motion which maketh Cold, should be such as sets them closer together. But contrary Motions are (to speak properly) when upon two ends of a Line two Bodies move towards each other, the Effect whereof is to make them meet. But each of them (as to this Question) is the same.

A.

Do you think (as many Philosophers have held and now hold) that Cold is nothing but a privation of Heat?

B.

No. Have you never heard the Fable of the Satyre that dwelling with a Husbandman, and seeing him blow his fingers to warm them, and his Pottage to cool it, was so scandalized, that he ran from him, saying he would no longer dwell with one that could blow both Hot and Cold with one breath? Yet the Cause is evident enough. For the Air which had gotten a Calefactive power from his vital parts, was from his mouth and throat gently diffused on his fingers, and retained still that power. But to cool his Pottage he streightened the passage at his lips, which extinguished the Calefactive Motion.

A.

Do you think Wind the general Cause of Cold? If that were true, in the greatest Winds we should have the greatest Frosts.

B.

I mean not any of those uncertain Winds which, I said, were made by the Clouds, but such as a Body moved in the Air makes to and against it self. For it is all one Motion of the Air, whether it be carried against the Body, or the Body against it. Such a Wind as is constant (if no other be stirring) from East to West made by the Earth turning dayly upon its own Centre. Which is so swift, as (except it be kept off by some hill) to kill a man, as by Experience hath been found by those who have passed over great Mountains, and specially over the Andies which are opposed to the East. And such is the Wind which the Earth maketh in the Air by her Annual Motion, which is so swift, as that (by the Calculation of Astronomers) to go Sixty miles in a minute of an hour. And therefore this must be the Motion which makes it so cold about the Poles of the Ecliptique.

A.

Does not the Earth make the Wind as great in one part of the Ecliptique as in another?

B.

Yes. But when the Sun is in Cancer, it tempers the Cold, and still less and less, but least of all in the Winter-Solstice, where his beams are most oblique to the Superficies of the Earth.

A.

I thought the greatest Cold had been about the Poles of the Aequator.

B.

And so did I once. But the reason commonly given for it is so improbable, that I do not think so now. For the Cause they render of it, is onely, that the

Motion of the Earth is swiftest in the Aequinoctial, and slowest about the Poles; and consequently (since Motion is the Cause of Heat, and Cold is but (as 'twas thought) a want of the same) they inferr'd that the greatest Cold must be about the Poles of the Aequinoctial. Wherein they miscounted. For not every Motion causeth Heat, but this agitation onely, which we call compounded Motion; though some have alleadged Experience for that opinion; as that a Bullet out of a Gun will with its own swiftness melt. Which I never shall believe.

A.

'Tis a common thing with many Philosophers to maintain their Fancies with any rash report, and sometimes with a Lye. But how is it possible that so soft a Substance as water should be turned into so hard a Substance as Ice?

B.

When the Air shaves the Globe of the Earth with such swiftness, as that of Sixty miles in a minute of an hour, it cannot (where it meets with still water) but beat it up into small and undistinguishable bubbles, and involve it self in them as in so many bladders or skins of Water. And Ice is nothing else but the smallest imaginable parts of Air and Water mixt; which is made hard by this compounded Motion, that keeps the parts so close together, as not to be separated in one place without disordering the Motion of them all. For when a Body will not easily yield to the impression of an external Movent in one place without yielding in all, we call it Hard; And when it does, we say 'tis Soft.

A.

Why is not Ice as well made in a moved as in a still water? Are there not great Seas of Ice in the Northern parts of the Earth?

B.

Yes, and perhaps also in the Southern parts. But I cannot imagine how Ice can be made in such agitation as is always in the open Sea made by the Tides and by the Winds. But how it may be made at the Shoar, it is not hard to imagine. For in a River or Current, though swift, the water that adhereth to the banks is quiet, and easily by the Motion of the Air driven into small insensible bubbles; and so may the water that adhereth to those bubbles, and so forwards till it come into a stream that breaks it, and then it is no wonder though the fragments be driven into the open Sea, and freeze together into greater lumps. But when in the open Sea, or at the Shoar, the Tide or a great Wave shall arise, this young and tender Ice will presently be washt away. And therefore I think it evident, that as in the Thames the Ice is first made at the banks where the Tide is weak or none, and broken by the stream comes down to London, and part goes to the Sea floating till it dissolve, and part (being too great to pass the Bridge) stoppeth there and sustains that which follows, till the River be quite frozen over: So also the Ice in the Northern Seas begins first at the banks of the Continent and Islands which are scituated in that Climate, and then broken off, are carried up and down, and one against another, till they become great Bodies.

A.

But what if there be Islands, and narrow Inlets of the Sea, or Rivers also about the Pole of the Aequinoctial?

B.

If there be, 'tis very likely the Sea may also there be covered all over with Ice. But for the truth of this, we must stay for some further discovery.

A.

When the Ice is once made and hard, what dissolves it?

B.

The Principal Cause of it, is the weight of the water it self; but not without some abatement in the Stream of the Air that hardned it; as when the Sunbeams are less oblique to the Earth, or some contrary Wind resisteth the stream of the Air. For when the impediment is removed, then the nature of the water only worketh, and (being a heavie Body) downward.

A.

I forgot to ask you, Why two pieces of Wood rub'd swiftly one against another, will at length set on fire.

B.

Not onely at length, but quickly, if the Wood be dry. And the Cause is evident, viz. the compounded Motion which dissipates the external small parts of the Wood. And then the inner parts must of necessity (to preserve the Plenitude of the Universe) come after; first the most Fluid, and then those also of greater consistence, which are first erected, and (the Motion continued) made to flie swiftly out; whereby the Air driven to the Eye of the beholder, maketh that fancie which is called Light.

A.

Yes. I remember you told me before, that upon any strong pressure of the Eye, the resistance from within would appear a Light. But to return to the enquiry of Heat and Cold, there be two things that beyond all other put me into admiration. One is the swiftness of kindling in Gunpowder. The other is the freezing of Water in a Vessel (though not far from the fire) set about with other water with Ice and Snow in it. When Paper or Flax is flaming, the flame creeps gently on; and if a house full of Paper were to be burnt with putting a Candle to it, it will be long in burning; whereas a spark of fire would set on flame a mountain of Gunpowder in almost an instant.

B.

Know you not Gunpowder is made of the powder of Charcole, Brimstone, and Saltpeter? Whereof the first will kindle with a spark, the second flame as soon as toucht with fire; and the third blows it, as being composed of many Orbs of Salt fill'd with Air, and as it dissolveth in the flame, furiously blowing increaseth it. And as for making Ice by the fire side. It is manifest that whilst the Snow is dissolving in the external vessel, the Air must in the like manner break forth, and shave the Superficies of the inner vessel, and work through the water till it be frozen.

A.

I could easily assent to this, if I could conceive how the Air that shaves (as you say) the outside of the Vessel, could work through it. I conceive well enough a pail of water with Ice or Snow dissolving in it, and how it causeth Wind. But how that Wind should communicate it self through the vessel of wood or metal, so as to make it shave the Superficies of the water which is within it, I do not so well understand.

B.

I do not say the inner Superficies of the vessel shaves the water within it. But 'tis manifest that the Wind made in the Pail of water by the melting Snow or Ice presseth the sides of the Vessel that standeth in it; and that the pressure worketh clean through, how hard soever the Vessel be; and that again worketh on the water within, by restitution of its parts, and so hardeneth the water by degrees.

A.

I understand you now. The Ice in the Pail by its dissolution transfers its Hardness to the water within.

B.

You are merry. But supposing, as I do, that the Ice in the Pail is more than the water in the Vessel, you will finde no absurdity in the Argument. Besides, the Experiment, you know, is common.

A.

I confess it is probable. The Greeks have the word ... (whence the Latins have their word Frigus) to signifie the curling of water by the Wind; and use the same also for Horrour, which is the passion of one that cometh suddenly into a cold Air, or is put into a sudden affright, whereby he shrinks, and his hair stands upright. Which manifestly shews that the Motion which causeth Cold, is that which pressing the Superficies of a Body, sets the parts of it closer together. But to proceed in my Quaeries. Monsieur Des Cartes, who (you know) hath written somewhere, that the noise we hear in Thunder, proceeds from breaking of the Ice in the Clouds; What think you of it? Can a Cloud be turned into Ice?

B.

Why not? A Cloud is but Water in the Air.

A.

But how? For he has not told us that.

B.

You know that 'tis onely in Summer, and in hot weather, that it Thunders; or if in Winter, it is taken for a Prodigie. You know also, that of Clouds, some are higher, some lower, and many in number, as you cannot but have oftentimes observed, with spaces between them. Therefore, as in all Currents of water, the Water is there swiftest where it is streightned with Islands, so must the Current of Air made by the Annual Motion be swiftest there, where it is checkt with many Clouds through which it must (as it were) be strained, and leave behinde it many small particles of earth, always in it, and in hot weather more than ordinary.

A.

This I understand, and that it may cause Ice. But when the Ice is made, how is it broken? And why falls it not down in shivers?

B.

The particles are inclosed in small Caverns of the Ice; and their Natural Motion being the same which we have ascribed to the Globe of the Earth, requires a sufficient space to move in. But when it is imprisoned in a less room than that, then a great part of the Ice breaks: And this is the Thunder-clap. The Murmur following is from the settling of the Air. The Lightening

is the fancie made by the recoiling of the Air against the Eye. The fall is in Rain, not in Shivers; because the prisons which they break are extreme narrow, and the shivers being small, are dissolved by the Heat. But in less Heat they would fall in Drops of Hail, that is to say, half frozen by the shaving of the Air as they fall, and be in a very little time (much less than Snow or Ice) dissolved.

A.

Will not that Lightning burn?

B.

No. But it hath often kill'd men with Cold. But this extraordinary swiftness of Lightning consisteth not in the Expansion of the Air, but in a straight and direct stream from where it breaks forth; which is in many places successively, according to the Motion of the Cloud.

A.

Experience tells us that. I have now done with my Problems concerning the great Bodies of the world, the Stars, and Element of Air in which they are moved, and am therein satisfied, and the rather, because you have answered me by the Supposition of one onely Motion, and commonly known, and the same with that of Copernicus, whose Opinion is received by all the Learned; and because you have not used any of these empty terms, Sympathy, Antipathy, Antiperistasis, &c. for a natural Cause, as the old Philosophers have done to save their credit. For though they were many of them wise men, as Plato, Aristotle, Seneca, and others, and have written excellently of Morals and Politiques, yet there is very little Natural Philosophy to be gathered out of their Writings.

B.

Their Ethiques and Politiques are pleasant reading, but I finde not any argument in their discourses of Justice or Vertue drawn from the supreme Authority, on whose Laws all Justice, Vertue, and good Politiques depend.

A.

Concerning this Cover, or (as some have called it) the Scurf or Scab of the Terrestrial Star, I will begin with you to morrow. For it is a large Subject, containing Animals, Vegetables, Metals, Stones, and many other kinds of Bodies, the knowledge whereof is desired by most men, and of the greatest and most general profit.

B.

And this is it, in which I shall give you the least satisfaction; so great is the variety of Motion, and so concealed from humane senses.

CAP. VII. OF HARD AND SOFT, AND OF THE ATOMES THAT FLIE IN THE AIR.

A.

CONCERNING this Cover of the Earth, made up of an infinite number of parts of different natures, I had much ado to finde any tolerable method of enquiry. But I resolved at last to begin with the Questions concerning Hard and Soft, and what kinde of Motion it is that makes them so. I know that in any pulsion of Air, the parts of it go innumerable and inexplicable ways; but I ask only if every point of it be moved.

B.

No. If you mean a Mathematical point, you know it is impossible. For nothing is movable but Body. But I suppose it divisible (as all other Bodies) into parts divisible. For no Substance can be divided into Nothings.

A.

Why may not that Substance within our Bodies, which are called Animal spirits, be another kind of Body, and more subtile than the common Air?

B.

I know not why, no more than you or any man else knows why it is not very Air, though purer perhaps than the common Air, as being strained through the blood into the Brain and Nerves. But howsoever that be, there is no doubt, but the least parts of the common Air, (respectively to the whole)

will easilier pierce (with equal Motion) the Body that resisteth them, than the least parts of water. For it is by Motion onely that any mutation is made in any thing; and all things standing as they did, will appear as they did. And that which changeth Soft into Hard, must be such as makes the parts not easily to be moved without being moved all together; which cannot be done but by some Motion compounded. And we call Hard, that whereof no part can be put out of order without disordering all the rest; which is not easily done.

A.

How Water and Air beaten into extreme small Bubbles is hardned into Ice, you have told me already, and I understand it. But how a soft Homogeneous Body, as Air, or Water, should be so hardned, I cannot imagine.

B.

There is no hard Body that hath not also some degree of Gravity; and consequently, being loose, there must be some Efficient Cause, that is, some Motion, when it is severed from the Earth, to bring the same to it again. And seeing this compounded Motion gives to the Air and Water an Endeavour from the Earth, the Motion which must hinder it, must be in a way contrary to the compounded Motion of the Earth. For whatsoever, having been asunder, comes together again, must come contrary ways, as those that follow one another go the same way, though both move upon the same Line.

A.

What Experiment have you seen to this purpose?

B.

I have seen a drop of glass like that of the second Figure, newly taken out of the furnace, and hanging at the end of an Iron rod, and yet Fluid, and let fall into the water and hardned. The Club-end of it A A coming first to the water, the tail B C following it. 'Tis proved before, that the motion that makes it is a compounded Motion, and gives an Endeavour outward to every part of it; and that the Motion which maketh Cold, is such as shaving the Body in every point of contact, and turning it, gives them all an Endeavour inward. Such is this Motion made by the sinking of the hot and fluid glass into the water. 'Tis therefore manifest that the Motion which hardneth a Soft Body, must in every point of contact be in the contrary way to that which makes a hard body Soft. And further, that slender tail B C shall be made much more hard than common Glass. For towards the upper end, in C, you cannot easily break it, as small as it is. And when you have broken it, the whole Body will fall into dust, as it must do, seeing the bending is so difficult. For all the parts are bent with such force, that upon the breaking at D, by their sudden restitution to their liberty, they will break together. And the cause why the tail B C, being so slender, becomes so hard, is, that all the Endeavour in the great part A B, is propagated to the small part B C, in the same manner as the force of the Sun-beams is derived almost to a point by a Burning-glass. But the Cause why, when it is broken in D, it breaks also in so many other places, is, that the Endeavour in all the other parts (which is called the Spring) unbends it; from whence a Motion is caused the contrary way, and that Motion continued bends it more the other way and breaks it, as a Bow over-bent is broken into shivers by a sudden breaking of the string.

A.

I conceive now how a Body which having been Hard and softned again, may be rehardned; but how a Fluid and meer Homogeneous Body, as Air or Water, may be so, I see not yet. For the hardning of water is making a hard Body of two Fluids, whereof one (which is the water) hath some tenacity; and so a man may make a Bladder hard with blowing into it.

B.

As for meer Air, which hath no Natural Motion of it self, but is moved onely by other Bodies of a greater consistence, I think it impossible to be hardned. For the parts of it so easily change places, that they can never be fixt by any Motion. No more I think can Water, which though somewhat less Fluid, is with an insensible force very easily broken.

A.

It is the opinion of many learned men, that Ice (in long time) will be turned into Christal; and they alleadge Experience for it. For they say that Christal is found hanging on high Rocks in the Alps like Isicles on the Eaves of a house, and why may not that have formerly been Ice, and in many years have lost the power of being reduced?

B.

If that were so, it would still be Ice, though also Christal: Which cannot be, because Christal is heavier than Water, and therefore much heavier than Ice.

A.

Is there then no transubstantiation of Bodies but by mixture?

B.

Mixture is no transubstantiation.

A.

Have you never seen a Stone that seemed to have been formerly Wood, and some like Shells, and some like Serpents, and others like other things?

B.

Yes. I have seen such things, and particularly I saw at Rome in a Stone-cutters work-house a Billet of Wood, as I thought it, partly covered with bark, and partly with the grain bare, as long as a mans Arm, and as thick as the Calf of a mans Leg; which handling I found extreme heavie, and saw a small part of it which was polished, and had a very fine Gloss, and thought it a substance between Stone and Metal, but neerest to Stone. I have seen also a kind of Slate painted naturally with Forest-work. And I have seen in the hands of a Chymist of my acquaintance at Paris, a broken Glass, part of a Retort, in which had been the Rozin of Turpentine, wherein though there were left no Rozin, yet there appeared in the piece of Glass many Trees; and Plants in the ground about them, such as grow in Woods; and better designed than they could be done by any Painter; and continued so for a long time. These be great wonders of Nature, but I will not undertake to shew their causes. But yet this is most certain, that nothing can make a hard Body of a Soft, but by some Motion of its parts. For the parts of the Hardest Body in the world can be no closer together than to touch; and so close are the parts of Air and Water, and consequently they should be equally Hard, if their smallest parts had not different Natural Motions. Therefore if you ask me the Causes of these Effects, I answer, They are different Motions. But if you expect from me how and by what Motions, I shall fail you. For there is no kind of Substance in the World now, that was not at the first Creation, when the Creator gave to all things what Natural and special Motion he

thought good. And as he made some Bodies wondrous great, so he made others wondrous little. For all his works are wondrous. Man can but guess, nor guess further, than he hath knowledge of the variety of Motion. I am therefore of opinion, that whatsoever perfectly Homogeneous is Hard, consisteth of the smallest parts (or, as some call them, Atomes) that were made Hard in the beginning, and consequently by an Eternal Cause; and that the hardness of the whole Body is caused onely by the contact of the parts by pressure.

A.

What Motion is it that maketh a hard Body to melt?

B.

The same compounded Motion that heats, namely, that of Fire, if it be strong enough. For all Motion compounded is an Endeavour to dissipate (as I have said before) the parts of the Body to be moved by it. If therefore hardness consist onely in the pressing Contact of the least parts, this Motion will make the same parts slide off from one another, and the whole to take such a figure as the weight of the parts shall dispose them to, as in Lead, Iron, Gold, and other things melted with Heat. But if the small parts have such figures as they cannot exactly touch, but must leave spaces between them filled with Air or other Fluids, then this Motion of the fire, will dissipate those parts some one way, some another, the Hard part still hard; as in the burning of Wood or Stone into Ashes or Lime. For this Motion is that which maketh Fermentation, scattering dissimilar parts, and congregating similar.

A.

Why do some hard Bodies resist breaking more one way than another?

B.

The Bodies that do so, are for the most part Wood, and receive that quality from their generation. For the heat of the Sun in the Spring-time draweth up the moisture at the Root, and together with it the small parts of the Earth, and twisteth it into a small twig by its Motion upwards to some length, but to very little other dimensions, and so leaves it to dry till the Spring following; and then does the same to that, and to every small part round about it; so that upward the strength is doubled, and the next year trebled, &c. And these are called the grain of the Wood, and but touch one another, like sticks with little or no binding, and therefore can hardly be broken across the grain, but easily all-along it. Also some other hard Bodies have this quality of being more fragile one way than another, as we see in quarrels of a Glass-window, that are aptest many times to break in some crooked Line. The cause of this may be, that when the glass, hot from the Furnace, is poured out upon a Plain, any small stones in or under it will break the stream of it into divers lines, and not onely weaken it, but also cause it falsly to represent the Object you look on through it.

A.

What is the Cause why a Bow of Wood or Steel, or other very hard Body, being bent, but not broken, will recover its former degree of straightness?

B.

I have told you already, how the smallest parts of a hard Body have every one (by the generation of hardness) a Circular, or other compounded Motion; such Motion is that of the smallest parts of the Bow. Which Circles

in the bending you press into narrower figures, as a Circle into an Ellipsis, and an Ellipsis into a narrower but longer Ellipsis with violence; which turns their Natural Motion against the outward parts of the Bow so bent, and is an Endeavour to stretch the Bow into its former posture. Therefore if the impediment be removed, the Bow must needs recover its former Figure.

A.

'Tis manifest; and the cause can be no other but that, except the Bow have Sense.

B.

And though the Bow had Sense, and Appetite to boot, the Cause will be still the same.

A.

Do you think Air and Water to be pure and Homogeneous Bodies?

B.

Yes, and many Bodies both Hard and Heavie to be so too, and many liquors also besides water.

A.

Why then do men say they finde one Air healthy, another infectious?

B.

Not because the nature of the Air varies, but because there are in the Air drawn, or rather, beaten up by the Sun, many little Bodies, whereof some

have such Motion as is healthful, others such as is hurtful to the life of man. For the Sun (as you see in the generation of Plants) can fetch up Earth as well as Water; and from the driest ground any kind of Body that lieth loose, so it be small enough, rather than admit any Emptiness. By some of these small Bodies it is that we live; which being taken in with our breath, pass into our blood, and cause it (by their compounded Motion) to circulate through the Veins and Arteries; which the blood of it self (being a heavie Body) without it cannot do. What kind of substance these Atomes are, I cannot tell. Some suppose them to be Nitre. As for those infectious creatures in the Air, whereof so many die of the Plague, I have heard that Monsieur Des Cartes, a very ingenious man, was of opinion, that they were little Flies. But what grounds he had for it, I know not, though there be many Experiments that invite me to believe it. For first, we know that the Air is never universally infected over a whole Country, but onely in or neer to some populous Town. And therefore the cause must also be partly ascribed to the multitude thronged together, and constrained to carry their Excrements into the fields round about and neer to their habitation. Which in time fermenting breed Worms, which commonly in a month or little more, naturally become Flies; and though engendred at one Town, may flie to another. Secondly, in the beginning of a Plague, those that dwell in the Suburbs, that is to say, neerest to this corruption, are the poorest of the people, that are nourished for the most part with the Roots and Herbs which grow in that corrupted dirt; so that the same filth makes both the blood of poor people, and the substance of the Fly. And 'tis said by Aristotle, that every thing is nourished by the matter whereof it is generated. Thirdly, when a Town is infected, the Gentlemen, and those that live on wholsomest food, scarce one of Five hundred die of the Plague. It seems therefore, whatsoever creatures they be that invade us from the Air, they can discern their proper nourishment, and do not enter into the mouth and nostrils with

the breath of every man alike, as they would do if they were inanimate. Fourthly, a man may carry the infection with him a great way into the Country in his Clothes, and infect a Village. Shall another man there draw the Infection from the Clothes onely by his breath? Or from the Hangings of a Chamber wherein a man hath died? It is impossible. Therefore whatsoever killing thing is in the Clothes or Hangings, it must rise and go into his mouth or nostrils before it can do him hurt. It must therefore be a Fly, whereof great numbers get into the blood, and there feeding and breeding Worms, obstruct the Circulation of the blood, and kill the man.

A.

I would we knew the palate of those little Animals; we might perhaps finde some medicine to fright them from mingling with our breath. But what is that which kills men that lie asleep too neer a Charcole-fire? Is it another kind of Fly? Or is Charcole venomous?

B.

It is neither Fly nor venom, but the Effect of a flameless glowing fire, which dissipates those Atomes that maintain the circulation of the blood; so that for want of it, by degrees they faint, and being asleep cannot remove, but in short time, there sleeping die, as is evident by this, that being brought into the open Air (without other help) they recover.

A.

'Tis very likely. The next thing I would be informed of, is the nature of Gravity. But for that, if you please, we will take another day.

CAP. VIII. OF GRAVITY AND GRAVITATION.

B.

WHAT Books are those?

A.

Two Books written by two learned men concerning Gravity. I brought them with me, because they furnish me with some material Questions about that Doctrine; though of the nature of Gravity, I finde no more in either of them than this, That Gravity is an Intrinsic Quality by which a Body so qualified descendeth perpendicularly towards the Superficies of the Earth.

B.

Did neither of them consider that descending is local Motion, that they might have called it an intrinsic Motion rather than an intrinsic quality?

A.

Yes. But not how Motion should be intrinsic to the special individual Body moved. For how should they, when you are the first that ever sought the differences of Qualities in local Motion, except your authority in Philosophy were greater with them than it is? For 'tis hard for a man to conceive (except he see it) how there should be Motion within a Body, otherwise than as it is in living creatures.

B.

But it may be they never sought, or despaired of finding what natural Motion could make any inanimate thing tend one way rather than another.

A.

So it seems. But the first of them enquires no further than, Why so much water (being a heavie Body) as lies perpendicularly on a Fishes back in the bottom of the Sea, should not kill it. The other (whereof the Author is Dr. Wallis) treateth universally of Gravity.

B.

Well. But what are the Questions which from these Books you intend to ask me?

A.

The Author of the first Book tells me, that Water and other Fluids are Bodies continued, and act (as to Gravity) as a piece of Ice would do of the same Figure and quantity. Is that true?

B.

That the Universe (supposing there is no place empty) is one entire Body, and also, as he saith it is, a continual Body, is very true. And yet the parts thereof may be contiguous, without any other cohesion but Touch. And it is also true, that a Vessel of Water will descend in a medium less heavie (but Fluid) as Ice would do.

A.

But he means that water in a Tub would have the same Effect upon a Fish in the bottom of the Tub, as so much Ice would have.

B.

That also would be true, if the water were frozen to the sides of it. Otherwise the Ice (if there be enough) will crush the Fish to death. But how applies he this, to prove that the water cannot hurt a Fish in the Sea by its weight?

A.

It plainly appears that Water does not Gravitate on any part of it self beneath it.

B.

It appears by Experience, but not by this Argument, though instead of Water the Tub were fill'd with Quicksilver.

A.

I thought so. But how it comes to pass that the Fish remains uncrush'd, I cannot tell.

B.

The Endeavour of the Quicksilver downward, is stopt by the resistance of the hard bottom. But all Resistance is a contrary Endeavour; that is, an Endeavour upwards, which gives the like Endeavour to the Quicksilver, which is also heavie, and thereby the Endeavour of the Quicksilver is diverted to the sides round-about; where stopt again by the resistance of the

sides, it receives an Endeavour upwards, which carries the Fish to the top, lying all the way upon a soft bed of Quicksilver. This is the true manner how the Fish is saved harmless. But your Author, I believe, either wanted age, or had too much business, to study the doctrine of Motion; and never considered that Resistance is not an impediment onely, or privation, but a contrary Motion; and that when a man claps two pieces of Wax together, their contrary Endeavour will turn both the pieces into one Cake of Wax.

A.

I know not the Author; but it seems he has deeplier considered this Question than other men. For in the Introduction to his Book, he saith, That men have pre-engaged themselves to maintain certain Principles of their own invention, and are therefore unwilling to receive any thing that may render their labour fruitless: and That they have not strictly enough considered the several interventions that abate, impede, advance, or direct the Gravitation of Bodies.

B.

This is true enough; and he himself is one of those men, in that he considered not, that Resistance is one of those interventions, which abate, impede, and direct Gravitation. But what are his Suppositions for the Question he handles?

A.

His first is, That as in a Pyramide of Brick, wherein the Bricks are so joyned, that the uppermost lies every where over the joynt or Cement of the two next below it, you may break down a part, and leave a Cavity, and yet the Bricks above will stand firm and sustain one another by their cross

posture: So also it is in Wheat, Hail-shot, Sand, or Water; and so they arch themselves, and thereby the Fish is every way secured by an arch of water over it.

B.

That the cause why Fishes are not crushed nor hurt in the bottom of the Sea by the weight of the water, is the waters arching it self, is very manifest. For if the uppermost Orb of the water should descend by its Gravity, it would tend toward the Centre of the Earth, and place it self all the way in a less and lesser Orb; which is impossible. For the places of the same Body are always equal. But that Wheat, Sand, Hail-shot, or loose Stones should make a firm arch, is not credible.

A.

The Author therefore (it seems) quits it: And taketh a second Hypothesis for the true Cause, though the former (he saith) be not useless, but contributes its part to it.

B.

I see, though he depart from his Hypothesis, he looks back upon it with some kindness. What is his second Hypothesis?

A.

It is, That Air and Water have an Endeavour to Motion upward, downward, directly, obliquely, and every way. For Air (he saith) will come down his chimney, and in at his door, and up his stairs.

B.

Yes, and mine too; and so would Water if I dwelt under water, rather than admit of Vacuum. But what of that?

A.

Why then it would follow, that those several tendencies or Endeavours would so abate, impede, and correct one another, as none of them should Gravitate. Which being granted, the Fish can take no harm. Wherein I finde one difficulty. Which is this: The Water having an Endeavour to Motion every way at once, methinks it should go no way, but lie at rest; which, he saith, was the opinion of Stevinus, and rejecteth it, saying, it would crush the Fish into pieces.

B.

I think the Water in this case would neither rest nor crush. For the Endeavour being (as he saith) intrinsecal, and every way, must needs drive the water perpetually outward, that is to say (as to this Question) upwards; and seeing the same Endeavour in one individual Body cannot be more ways at once than one, it will carry it on perpetually without limit, beyond the fixed Stars; and so we shall never more have rain.

A.

As ridiculous as it is, it necessarily follows.

B.

What are Dr. Wallis his Suppositions?

A.

He goes upon Experiments. And first he alleadgeth this, That Water left to it self without disturbance, does naturally settle it self into a Horizontal Plain.

B.

He does not then (as your Author and all other men) take Gravity for that Quality whereby a Body tendeth to the Centre of the Earth.

A.

Yes, he defines Gravity to be a Natural propension towards the Centre of the Earth.

B.

Then he contradicteth himself. For if all heavie Bodies tend naturally to one Centre, they shall never settle in a Plain, but in a Spherical Superficies. But against this, That such an Horizontal Plain is found in water by Experience, I say it is impossible. For the Experiment cannot be made in a Bason, but in half a mile at Sea, Experience visibly shews the contrary. According to this, he should think also that a pair of Scales should hang parallel.

A.

He thinks that too.

B.

Let us then leave this Experiment. What saies he further concerning Gravity?

A.

He takes for granted (not as an Experiment, but an Axiome) that Nature worketh not by election, but ad ultimum virium, with all the power it can.

B.

I think he means (for 'tis a very obscure passage) that every inanimate Body by nature worketh all it can without election; which may be true. But 'tis certain that men (and beasts) work often by election, and often without election; as when he goes by election, and falls without it. In this sence I grant him, that Nature does all it can. But what infers he from it?

A.

That naturally every Body has every way (if the ways oppose not one another) an Endeavour to Motion. And consequently, that if a Vessel have two holes, one at the side, another at the bottom, the water will run out at both.

B.

Does he think the Body of water that runs out at the side, and that which runs out at the bottom is but one and the same Body of water?

A.

No sure. He cannot think but that they are two several parts of the whole Water in the Vessel.

B.

What wonder is it then, if two parts of water run two ways at once, or a thousand parts a thousand ways? Does it follow thence that one Body can

go more than one way at once? Why is he still meddling with things of such difficulty? He will find at last that he has not a Genius either for Natural Philosophy or for Geometry. What other Suppositions has he?

A.

My first Author had affirmed, that a lighter Body does not Gravitate on a heavier; against this Dr. Wallis thus argues: Let there be a Siphon A B C D filled with Quicksilver to the level A D. If then you pour Oyl upon A as high as to E, he asks if the Oyl in A E (as being heavier) shall not press down the Quicksilver a little at A, and make it rise a little at D, suppose to F. And answers himself, that certainly it will. So that it is neither an Experiment nor an Hypothesis, but only his opinion.

B.

Whatsoever it be, it is not true; though the Doctor may be pardoned, because the contrary was never proved.

A.

Can you prove the contrary?

B.

Yes. For the Endeavour of the Quicksilver both from A and D downward, is stronger than that of the Oyl downward. If therefore the Endeavour of the Quicksilver were not resisted by the bottom B C, it would fall so, by reason of the acceleration of heavier Bodies in their descending, as to leave the Oyl, so that it should not only not press, but also not touch the Quicksilver. It is true in a pair of Scales equally charged with Quicksilver, that the addition of

a little Oyl to either Scale, will make it praeponderate. And that was it deceiv'd him.

A.

'Tis evident. The last Experiment he cites is the weighing of Air in a pair of Scales, where 'tis found manifestly that it has some little weight. For if you weigh a Bladder, and put the weight into one Scale, and then blow the Bladder full of Air, and put it into the other Scale, the full Bladder will outweigh the empty. Must not then the Air Gravitate?

B.

It does not follow. I have seen the Experiment just as you describe it, but it can never be thence demonstrated that Air has any weight. For as much Air as is prest downward by the weight of the blown Bladder, so much will rise from below, and lay it self Spherically at the altitude of the Center of gravity of the Bladder so blown. So that all the Air within the Bladder above that Centre, is carried thither imprisoned, and by violence: And the force that carries it up, is equal to that which presseth it down. There must therefore be allowed some little counterpoise in the other Scale to ballance it. Therefore the Experiment proves nothing to his purpose. And whereas they say there be small heavie Bodies in the Air, which make it Gravitate, do they think the force which brought them thither cannot hold them there?

A.

I leave this Question of the Fish, as cleerly resolved, because the water tending every way to one point (which is the Centre of the Earth) must of necessity arch it self. And now tell me your own opinion concerning the

Cause of Gravity, and why all Bodies descend or ascend not all alike. For there can be no more Matter in one place than another if the places be equal.

B.

I have already shewed you in general, that the difference of Motion in the parts of several Bodies makes the difference of their Natures. And all the difference of Motions consisteth either in swiftness, or in the way, or in the duration. But to tell you in Special, why Gold is heaviest, and then Quicksilver, and then (perhaps) Lead, is more than I hope to know, or mean to enquire: for I doubt not but that the Species of heavie, hard, Opaque, and Diaphanous, were all made so at their creation, and at the same time separated from different Species. So that I cannot guess at any particular Motions that should constitute their natures, further than I am guided by the Experiments made by fire or mixture.

A.

You hope not then to make Gold by Art?

B.

No, unless I could make one and the same thing heavier than it was. God hath from the beginning made all the Kindes of Hard, and Heavie, and Diaphanous Bodies that are, and of such Figure and magnitude as he thought fit; but how small soever, they may by accretion become greater in the Mine, or perhaps by generation, though we know not how. But that Gold, by the art of man should be made of not Gold, I cannot understand; nor can they that pretend to shew how. For the heaviest of all Bodies, by what mixture soever of other Bodies, will be made lighter; and not to be received for Gold.

A.

Why, when the Cause of Gravity consisteth in Motion, should you despair of finding it?

B.

It is certain, that when any two Bodies meet, as the Earth and any heavie Body will, the Motion that brings them to or towards one another, must be upon two contrary ways; and so also it is when two Bodies press each other in order to make them Hard. So that one contrariety of Motion might cause both Hard and Heavie. But it doth not. For the hardest Bodies are not always the heaviest. Therefore I finde no access that way to compare the Causes of different Endeavours of heavie Bodies to descend.

A.

But shew me at least how any heavie Body that is once above in the Air, can descend to the Earth, when there is no visible movent to thrust or pull it down.

B.

'Tis already granted, that the Earth hath this compounded Motion supposed by Copernicus, and that thereby it casteth the Contiguous Air from it self every way round-about. Which Air so cast off, must continually by its nature, range it self in a Spherical Orb. Suppose a Stone (for instance) were taken up from the ground, and held up in the Air by a mans hand, what shall come into the place it fill'd when it lay upon the Earth?

A.

So much Air as is equal to the Stone in magnitude, must descend and place it self in an Orb upon the Earth. But then I see that to avoid Vacuum, another Orb of Air of the same magnitude must descend, and place it self in that, and so perpetually to the mans hand; and then so much Air as would fill the place must descend in the same manner, and bring the Stone down with it. For the Stone having no Endeavour upward, the least Motion of the Air (the hand being removed) will thrust it downward.

B.

'Tis just so. And further, the Motion of the Stone downward shall continually be accelerated according to the odde numbers from Unity; as you know hath been demonstrated by Galileo. But we are nothing the nearer by this, to the knowledge of why one Body should have a greater Endeavour downward than another. You see the Cause of Gravity is this compounded Motion with exclusion of Vacuum.

A.

It may be 'tis the Figure that makes the difference. For though Figure be not Motion, yet it may facilitate Motion, as you see commonly the breadth of a heavie Body retardeth the sinking of it. And the cause of it is, That it makes the Air have further to go laterally, before it can rise from under it. For suppose a Body of Quicksilver falling in the Air from a certain height, must it not (going as it does towards the Centre of the Earth) as it draws neerer and neerer to the Earth, become more and more slender, in the form of a Solid Sector? And if it have far to go, divide it self into drops? This Figure of a Solid Sector is like a Needle with the point downward, and therefore I should think that facilitating the Motion of it does the same that would be done by increasing the Endeavour.

B.

Do not you see that this way of facilitating is the same in Water, and in all other Fluid heavy Bodies. Besides, your Argument ought to be applicable to the weighing of Bodies in a pair of Scales (which it is not, for there they have no such Figure) it should also hold in the comparison of Gravity in Hard and Fluid Bodies.

A.

I had not sufficiently consider'd it. But supposing now (as you do) that both heavy and hard Bodies, in their smallest parts, were made so in the Creation; yet, because Quicksilver is harder than Water, a drop of Water shall in descending be prest into a more slender Sector than a drop of Quicksilver, and consequently the Earth shall more easily cast off any quantity of Water than the same quantity of Quicksilver.

B.

This one would think were true; as also that of simple Fluid Bodies, those whose smallest parts, naturally, without the force of Fire do strongest cohere, are generally the heaviest. But why then should Quicksilver be heavier than Stone or Steel? Fluidity and hardness are but degrees between greater Fluidity and greater hardness. Therefore to the knowledge of what it is that causeth the difference, in different Bodies, of their Endeavour downward, there are required (if it can be known at all) a great many more Experiments than have been yet made. It is not difficult to find why Water is heavier than Ice, or other Body mix'd of Air and Water. But to believe that all Bodies are heavier or lighter according to the quantity of Air within them, is very hard.

A.

I see by this, that the Creator of the World, as by his Power he ordered it, so by his Wisdom he provided it should be never disordered. Therefore leaving this Question, I desire to know whether if a heavy Body were as high as a fixt Star, it would return to the Earth.

B.

'Tis hard to try. But if there be this compounded Motion in the great Bodies so high, such as is in the Earth, it is very likely that some heavy Bodies will be carried to them. But we shall never know it till we be at the like height.

A.

What think you is the reason why a drop of Water (though heavy) will stand upon a Horizontal Plain of dry or unctuous Wood, and not spread it self upon it? For let A B (in the 6th Figure) be the dry Plain, D the drop of Water, and D C perpendicular to A B. The drop D (though higher) will not descend and spread it self upon it.

B.

The reason I think is manifest. For those Bodies which are made by beating of Water and Air together, shew plainly that the parts of Water have a great degree of Cohesion. For the skin of the Bubble is Water, and yet it can keep the Air (though moved) from getting out. Therefore the whole drop of Water at D, hath a good deal of Cohesion of parts. And seeing A B is an Horizontal Plain, the way from the contact in D either to A or B is upwards, and consequently there is no endeavour in D either of those ways, but what proceeds from so much weight of Water as is able to break that Cohesion,

which so small a drop is too weak to do. But the Cohesion being once broken, as with your Finger, the Water will follow.

A.

Seeing the descent of a heavy Body increaseth according to the odd numbers 1, 3, 5, 7, &c. and the aggregates of those numbers, viz. of 1 and 3; and 1 and 3 and 5; and of 1 and 3 and 5 and 7, &c. are square numbers, namely 4. 9. 16, the whole swiftness of the descent will be, I think, to the aggregate of so many swiftnesses equal to the first Endeavour, as square numbers are to their sides, 1, 2, 3, 4. Is it so?

B.

Yes, you know it hath been demonstrated by Galileo.

A.

Then if (for instance) you put into a pair of Scales equal quantities of Quicksilver and Water, seeing they are both accelerated in the same proportion, why should not the weight of Quicksilver to the weight of Water be in duplicate proportions to their first Endeavours?

B.

Because they are in a pair Scales. For there the Motion of neither of them is accelerated. And therefore it will be, as the first Endeavour of the Quicksilver to the first endeavour of the Water, so the whole weight to the whole weight. By which you may see, that the Cause which takes away the Gravitation of Liquid Bodies from Fish or other lighter Bodies within them, can never be derived from the weight.

A.

I have one Question more to ask concerning Gravity. If Gravity be (as some define it) an intrinsecal quality, whereby a Body descendeth towards the Center of the Earth, how is it possible that a piece of Iron that hath this intrinsecal quality, should rise from the Earth, to go to a Loadstone? Hath it also an intrinsecal quality to go from the Earth? It cannot be. The Cause therefore must be extrinsecal. And because when they are come together in the Air, if you leave them to their own nature, they will fall down together, they must also have some like extrinsecal Cause. And so this magnetique vertue will be such another vertue as makes all other heavy Bodies to descend (in this our World) to the Earth. If therefore you can from this your Hypothesis of compounded Motion, by which you have so probably salved the Problem of Gravity, salve also this of the Loadstone, I shall acknowledge both your Hypothesis to be true, and your Conclusion to be well deduced.

B.

I think it not impossible. But I will proceed no further in it now, than (for the facilitating of the demonstrations) to tell you the several proprieties of the Magnet, whereof I am to shew the causes. As first, That Iron, and no other Body, at some little distance (though heavy) will rise to it. Secondly, That if it be laid upon a still Water in a floating Vessel, and left to it self, it will turn it self till it lye in a Meridian, that is to say, with one and the same Line still North and South. Thirdly, If you take a long slender piece of Iron, and apply the Loadstone to it, and (according to the position of the Poles of the Loadstone) draw it over to the end of the Iron, the Iron will have the same Poles with the Magnet, so it be drawn with some pressure; but the Poles will lye in a contrary Position; and also this long Iron will draw other

Iron to it as the Magnet doth. Fourthly, This long Iron, if it be so small as that poiz'd upon a Pin, the weight of it have no visible Effect, the Navigators use it for the Needle of their Compass, because it points North and South; saving that in most places by particular accidents it is diverted; which diversion is called the variation of the Horizontal Needle. Fifthly, The same Needle placed in a Plain perpendicular to the Horizon, hath another Motion called the Inclination. Which that you may the better conceive, draw a fourth Figure; wherein let there be a Circle to represent the Terrella, that is to say, a Spherical Magnet.

A.

Let this be it, whose Center is A, the North Pole B, the South Pole C.

B.

Join B C, and cross it at right Angles with the Diameter D E.

A.

'Tis done.

B.

Upon the point D set the Needle parallel to B C, with the cross for the South Pole, and the Barb for the North; and describe a Square about the Circle B D C E, and divide the arch D B into four equal parts in a, b, c.

A.

'Tis done.

B.

Then place the middle of the Needle on the points a, b, c, so that they may freely turn; and set the Barb which is at D toward the North, and that which is at C towards the South. You see plainly by this, that the Angles of Inclination through the Arch D C taken all together, are double to a Right Angle. For when the South point of the Needle, looking North, as at D, comes to look South, as at C, it must make half a Circle.

A.

That is true. And if you draw the Sine of the Arch D a (which is d a) and the Sine of the Arch B a (which is a c) and the Sine of the Arch D b (which is b f) and the Sine of the Arch B c (which is c g) the Needle will lye upon b f with the North-point downwards, so that the Needle will be parallel to A D. Then from a draw the line a h, making the Angle e a h equal to the Angle D A a. And then the Needle at a shall lye in the line a h with the South point toward h. Finally, draw the line c h, which (with c g) will also make a quarter of a right Angle; and therefore if the Needle be plac'd on the point c it will lye in c h with the South point toward h. And thus you see by what degrees the Needle inclines or dips under the Horizon more and more from D till it come to the North Pole at B; where it will lye parallel to the Needle in D; but with their Barbs looking contrary ways. And this is certain by experience, and by none contradicted.

B.

You see then why the degrees of the Inclinary Needle in coming from D to B are double to the degrees of a Quadrant. It is found also by experience, that Iron both of the Mine and of the Furnace put into a Vessel so as to float, will lay it self (if some accident in the Earth hinder it not) exactly North and South. And now I am, from this compounded Motion supposed by Copernicus, to derive the causes why a Loadstone draws Iron; why it makes

Iron to do the same; why naturally it placeth it self in a parallel to the Axis of the Earth; why by passing it over the Needle it changes its Poles; and what is the cause that it inclines. But it is your part to remember what I told you of Motion at our second meeting; and what I told you of this compounded Motion supposed by Copernicus, at our fourth meeting.

CAP. IX. OF THE LOADSTONE, AND ITS POLES; AND WHETHER THEY SHEW THE LONGITUDE OF PLACES ON THE EARTH.

A.

I Come now to hear what Natural Causes you can assign of the vertues of the Magnet; and first, why it draws Iron to it, and only Iron.

B.

You know I have no other cause to assign but some local Motion, and that I never approved of any argument drawn from Sympathy, Influence, Substantial Forms, or Incorporeal Effluvia. For I am not, nor am accounted by my Antagonists for a Witch. But to answer this Question, I should describe the Globe of the Earth greater than it is at B in the first Figure, but that the Terrella in the fourth Figure will serve our turn. For 'tis but calling B and C the Poles of the Earth, and D E the Diameter of the Aequinoctial Circle, and making D the East, and E the West. And then you must remember that the Annual Motion of the Earth is from West to East, and compounded of a straight and circular Motion, so as that every point of it shall describe a small Circle from West to East, as is done by the whole Globe. And let the Circles about a b c be three of those small Circles.

A.

Before you go any further, I pray you shew me how I must distinguish East and West in every part of this Figure. For wheresoever I am on Earth

(suppose at London) and see the Sun rise (suppose in Cancer) is not a straight line from my Eye to the Sun terminated in the East?

B.

'Tis not due East, but partly East, partly South. For the Earth (being but a point compared to the Sun) all the parallels to D E the Aequator, such as are e a, f b, e g, if they be produced, will fall upon the Body of the Sun. And therefore A b is North-East; A a East North-East; And A c North North-East.

A.

Proceed now to the Cause of Attraction.

B.

Suppose now that the Internal parts of the Loadstone had the same Motion with that of the Internal parts of the Sun which make the Annual Motion of the Earth from West to East, but in a contrary way, for otherwise the Loadstone and the Iron can never be made to meet. Then set the Loadstone at a little distance from the Earth, marked with z; and the Iron marked with x upon the superficies of the Earth. Now that which makes x rise to z, can be nothing else but Air; for nothing touches it but Air. And that which makes the Air to rise, can be nothing but those small circles made by the parts of the Earth (such as are at a b c,) for nothing else touches the Air. Seeing then the Motion of each point of the Loadstone is from East to West in Circles, and the motion of each point of the Iron from West to East; it follows, that the Air between the Loadstone and the Iron shall be cast off both East and West; and consequently the place left empty, if the Iron did

not rise up and fill it. Thus you see the Cause that maketh the Loadstone and the Iron to meet.

A.

Hitherto I assent. But why they should meet when some Heterogeneous Body lyes in the Air between them, I cannot imagine. And yet I have seen a Knife, though within the Sheath, attract one end of the Needle of a Mariners Compass; and have heard it will do the same though a Stone-wall were between.

B.

Such Iron were indeed a very and vigorous Loadstone. But the Cause of it is the same that causeth Fire or hot Water (which have the same compounded Motion) to work through a Vessel of Brass. For though the Motion be altered by restraint within the Heterogeneous Body, yet being continued quite through it restores it self.

A.

What is the Cause why the Iron rub'd over by a Loadstone will receive the vertue which the Loadstone hath of drawing Iron to it?

B.

Since the Motion that brings two Bodies to meet must have contrary ways, and that the Motions of the Internal parts of the Magnet and of the Iron are contrary; the rubbing of them together does not give the Iron the first Edeavour to rise, but multiplies it. For the Iron untouch'd will rise to a Loadstone; but if touch'd, it becomes a Loadstone to other Iron. For when they touch a piece of Iron they pass the Loadstone over it only one way, viz.

from Pole to Pole; not back again, for that would undo what before had been done; also they press it in passing, to the very end of the Iron, and somewhat hard. So that by this pressing Motion all the small Circles about the points a b c, are turned the contrary way. And the halves of those small Circles made on the Arch D B will be taken away, and the Poles changed, so as that the North-Poles shall point South, and the South Poles North, as in the Figure.

A.

But how comes it to pass, that when a Loadstone hath drawn a piece of Iron, you may add to it another, as if they begat one another? Is there the like Motion in the generation of Animals?

B.

I have told you that Iron of it self will rise to the Loadstone. Much more then will it adhere to it when it is armed with Iron, and both it and the Iron have a plain Superficies. For then not only the points of Contact will be many (which make the coherence stronger) but also the Iron wherewith it is armed is now another Loadstone, differing a little (which you perhaps think) as Male and Female. But whether this compounded Motion and confrication causeth the generation of Animals, how should I know, that never had so much leasure as to make any observation which might conduce to that?

A.

My next Question is, seeing you say the Loadstone, or a Needle touch'd with it, naturally respecteth the Poles of the Earth, but that the variation of it

proceedeth from some accidents in the Superficies of the Earth; what are those accidents?

B.

Suppose there be a Hill upon the Earth (for example) at r; then the stream of the Air which was between z and x Westward, coming to the Hill, shall go up the Hills side, and so down to the other side, according to the crooked Line which I have mark'd about the Hill by points; and this infallibly will turn the North-point of the Needle, being on the East side, more toward the East, and that on the other side more towards the West, than if there had been no Hill. And where upon the Earth are there not Eminencies and depressions, except in some wide Sea, and a great way from Land?

A.

But if that be true, the Variation in the same place should be always the same. For the Hills are not removed.

B.

The Variation of the Needle at the same place is still the same: but the Variation of the Variation is partly from the Motion of the Pole it self, which by the Astronomers is called *Motus trepidationis*; and partly from that, that the Variation cannot be truly observ'd: for the Horizontal Needle and the Inclinary Needle incline alike, but cannot incline in due quantity. For whether set upon a Pin or an Axis, their Inclination is hindred in the Horizontal Needle by the Pin it self. If upon an Axis, if the Axis be just, it cannot move; if slack, the weight will hinder it. But chiefly because the North Pole of the Earth draws away from it the North Pole of the Needle.

For two like Poles cannot come together. And this is the cause why the Variation in one place is East, and another West.

A.

This is indeed the most probable reason why the Variation varies, that ever I heard given. And I should presently acknowledge that this parallel Motion of the Axis of the Earth in the Ecliptick, supposed by Copernicus, is the true Annual Motion of the Earth, but that there is lately come forth a Book called Longitude found, which makes the Magnetical Poles distant from the Poles of the Earth eight Degrees and a half.

B.

I have the Book. 'Tis far from being demonstrated, as you shall find if you have the patience to see it examined. For wheresoever his demonstration is true, the conclusion (if rightly inferred) will be this, that the Poles of the Loadstone and the Poles of the Earth are the same. And where on the contrary his demonstrations are fallacies, it is because sometimes he fancieth the Lines he hath drawn, not where they are; sometimes because he mistakes his station; and sometimes because he goes on some false Principle of Natural Philosophy; and sometimes also because he knoweth not sufficiently the Doctrine of Spherical Triangles.

A.

I think that's the Book there which lyes at your Elbow. Pray you read.

B.

I find first (Pag. 4.) that the ground of his Argument are the two observations made by Mr. Burroughs; one at Vaygates, in 1676, where the

Variation from the Pole of the Earth he found to be 11 deg. 15 min. East; the other at Lime-house near London, in 1580, where the Variation from the Pole of the Earth was 8 deg. 38 min. West. By which he saith, he might find out the Magnetical Pole.

A.

Where is Vaygate?

B.

In 70 Degrees of North Latitude, the difference of Longitude between London and it being 58 Degrees.

A.

The Longitude of places being yet to seek, how came he to know this difference of 58 Degrees, except the Poles of the Magnet and the Earth be the same?

B.

I believe he trusted to the Globe for that. For the distance between the places is not above 2000 Miles the nearest way. But we will pass by that, and come to his Demonstration, and to his Diagram, wherein L is London, P the North-Pole of the Earth, V Vaygates. So that L P is 38 deg. 28 min. P V 20 deg. the Angle L P V 58 deg. for the difference between the Longitudes of Vaygates and London. This is the Construction. But before I come to the demonstration, I have an Inference to draw from these observations, which is this. Because in the same year the Variation at London was 11 deg. 15 min. East, and at Vaygates 8 deg. 38 min. West; If you subtract 11 deg. 15 min. from the Arc L P; and 8 deg. 38 min. from the Arc L V, the Variation

on both sides will be taken away; so that P V being the Meridian of Vaygates, and L P the Meridian of London, they shall both of them meet in P the Pole of the Earth. And if the Pole of the Magnet be nearer to the Zenith of London than is the Pole of the Earth, it shall be just as much nearer to the Zenith of Vaygates in the Meridian of Vaygates which is P V; as is manifest by the Diurnal Motion of the Earth.

A.

All this I conceive without difficulty. Proceed to the Demonstration.

B.

Mark well now. His words are these, (Pag. 5.) From P L V substract 11 deg. 15 min. and there remains the Angle V L M. Consider now which is the Angle P L V, and which is the remaining Angle V L M, and tell what you understand by it.

A.

He has mark'd the Angle P L V with two numbers, 11 deg. 15 min. and 21 deg. 50 min. which together make 33 deg. 5 min. And the Angle 11 deg. 15 min. being subtracted from P L V, there will remain 21 deg. 50 min. for the Angle V L M. I know not what to say to it. For I thought the Arc P V, which is 20 deg. had been the Arc of the Spherical Angle P L V; and that the Arc L V had been 58 deg. because he says the Angle L P V is so; and that the Arc L M had been 46 deg. because the Angle L P M is so; and lastly, that the Angle P L M had been 8 deg. 30 min. because the Arc P M is so.

B.

And what you thought had been true, if a Spherical Angle were a very Angle. For all Men that have written of Spherical Triangles take for the ground of their calculation (as Regiomontanus, Copernicus, and Clavius,) that the Arch of a Spherical Angle is the side opposite to the Angle. You should have considered also that he makes the Angle V P M 12 deg. but sets down no Arc to answer it. But that you may find I am in the right, look into the Definitions which Clavius hath put down before his Treatise of Spherical Triangles, and amongst them is this; The Arc of a Spherical Triangle is a part of a great Circle intercepted between the two sides drawn from the Pole of the said great Circle.

A.

The Book is nothing worth; for it is impossible to substract an Arc of a Circle out of a Spherical Angle. And I see besides that he takes the Superficies that lyeth between the sides L P and L M for an Arch, which is the quantity of an Angle; and is a Line, and cannot be taken out of a Superficies. I wonder how any Man that pretends to Mathematicks could be so much mistaken.

B.

'Tis no great wonder. For Clavius himself striving to maintain that a right Angle is greater than the Angle made by the Diameter and the Circumference, fell into the same error. A corner (in Vulgar Speech,) and an Angle (in the Language of Geometry) are not the same thing. But it is easie even for a learned Man sometimes to take them for the same, as this Author now has done; and proceeding he saith, Substract 8 deg. 38 min. from the Angle P V L, and there remains the Angle L V M.

A.

That again is false, because impossible. What was it that deceiv'd him now?

B.

The same misunderstanding of the nature of a Spherical Angle. Which appears further in this, that when he knew the Arc V P was part of a great Circle, he thought V M (which he maketh 8 deg. 30 min.) were also parts of a great Circle; which is manifestly false. For two great Circles (because they pass through the Center) do cut each other into halves. But P V is not half a Circle. He sure thought himself at Vaygates, and that P M V was equal to P V, although in the same Hemisphere.

A.

But how proves he that the Arc PM is 8 deg. 30 min?

B.

Thus. We have in two Triangles, P L M and P V M, two sides and one Angle included, to find P M the distance of the Magnetical Pole from the Pole of the Earth 8 deg. 30 min.

A.

Is that all? 'Tis very short for a Demonstration of two so difficult Problems, as the quantity of 8 deg. 30 min. and of the place of the Magnetical Pole. But he has proved nothing till he has shew'd how he found it. And though P M be 8 deg. 30 min. it follows not that M is the Magnetical Pole.

B.

Nor is it true. For if P M be 8 deg. 30 min. and V M 8 deg. 38 min. the whole Arc P M V will be 17 deg. 8 min. which should be 20 deg. Besides, whereas the Variations were East and West, the subtracting of them should be also East and West, but they are North and South.

A.

I am satisfied that the Magnetical Poles and the Poles of the Earth are the same. But thus much I confess, that if they were not the same, the Longitude were found. For the difference of the Latitudes of the Earths Aequator and of the Magnetical Aequator is the difference of the Longitude. But proceed.

B.

The Earth being a solid Body, and the Magnetick Sphere that encompasseth the Earth being a substance that hath not solidity to keep pace with the Earth, looseth in its Motion. And that may be the Cause of the Motion of the Magnetick Poles from East to West.

A.

This is very fine, and unexpected. The Magnetick Sphere (which I took for a Globe made of a Magnet) has not solidity to keep pace with the Earth, though it be one of the hardest Stones that are. It encompasseth the Earth; yet I thought nothing had encompassed the Earth but Air in which I breath and move. By this also the whole Earth must be a Loadstone. For two Bodies cannot be in one place. So that he is yet no further than Dr. Gilbert whom he sleights. And if the Sphere be a Magnet, then the Earth and Loadstone have the same Poles. See the force of Truth! which though it could not draw to it his reason, hath drawn his words to it.

B.

But perhaps he meant that the Magnetick vertue encompasseth the Earth, and not the Magnetick Body.

A.

But that helpeth him not. For if the Body of the Magnet be not there, the vertue then is the vertue of the Earth; and so again the Poles of the Earth are Magnetick Poles.

B.

You see how unsafe it is to boast of Doctrines as of Gods gifts, till we are sure that they are true. For God giveth and denieth as he pleaseth, not as our selves wish; as now to him he hath given Confidence enough, but hath denied him (at least hitherto) the finding of the Longitudes. In the next place (Pag. 8.) he seems much pleased that his Doctrine agrees with an opinion of Keplerus, That from the Creation to the year of our Lord it is to the year 1657 now 5650 years; and with that which he saith some Divines have held in times past, That as this World was created in six days, so it should continue six thousand years. By which account the World will be at an end 350 years hence; though the Scripture tell us it shall come as a Thief in the night. O what advantage 340 years hence will they have that know this, over them that know it not, by taking up Money at Interest, or selling Lands at 20 years purchase!

A.

But he says he will not meddle with that.

B.

Yes, when he had medled with it too much already.

A.

But you have not told me wherein consisteth this Agreement between him and Keplerus.

B.

I forgot it. 'Tis in the Motion of the Magnetick Poles. For precedently (Pag. 7.) he had said that their Period or Revolution was 600 years; their yearly Motion 36 min. and (Pag. 8.) that their Motion is by sixes. Six tenths of a degree in one year; six degrees in ten year; sixty degrees in a hundred year; and six times sixty degrees in 600 year.

A.

But what Natural Cause doth he assign of this revolution of 600 years?

B.

None at all. For the Magnet lying upon the Earth, can have no Motion at all but what the Earth and the Air give it. And because it is always at 8 deg. 30 min. distance from the Pole of the Earth, the Earth can give it no other Motion than what it gives to its own Poles by the precession of the Aequinoctial points. Nor can the Air give it any Motion but by its Stream; which must needs vary when the Stream varieth. But what a vast difference does he make between the period of the Motion of the Aequinoctial points, which are about or near 36000 years according to Copernicus (Lib. 3. Ca.) which makes the Annual precession to be 36 seconds, and the period of the Magnetical Poles Motion, which is but 600 years.

A.

Go on.

B.

He comes now (Pag. 15.) to the Inclinary Needle upon a Spherical Loadstone. Where he shews, by Diagram, that the Needle and the Instrument together moved toward the Magnetical Pole, make the sum of the Inclinations equal to two Quadrants, setting the North-point of the Needle Southward. Which I confess is true. But (in the same Page) he ascribeth the same Motion to the Earth in these words: As the Horizontal Needle hath a double Motion about the Round Loadstone or Terrulla, so also the Inclinary Needle hath a double Motion about the Earth. What is this, but a confession that the Poles of the Magnet and of the Earth are the same?

A.

'Tis plain enough.

B.

Besides, seeing he placeth the Magnetical Pole at M in the Meridian of Vaygates, the Needle being touch'd shall Incline to the Pole of the Earth which is P, as well there as at London, and make the North-Pole of the Earth point South.

A.

'Tis certain, because he puts both the Magnetical Pole and the Pole of the Earth in the same Meridian of the Earth. Nor see I any Cause why, the

Needle being the same, it should not be as subject to Variation, and to Variation of Variation, and to all Accidents of the Earth there, as in any other part.

B.

He putteth (Pag. 16.) a Question, At what distance from the Earth are the Magnetick Poles? and answers to it, They are very near the Earth, because the nearer the Earth, the greater the strength. What think you of this?

A.

I think they are in the Superficies of the Magnet, as the Pole of the Earth is in the Superficies of the Earth. And consequently, that then the Earth must be a part of the Magnet, and their Poles the same. For the Body of the Magnet and the Body of the Earth, if they be two, cannot be in one place.

B.

His next words are, Some things are to be considered concerning those Variations of the Horizontal Needle which are not according to the scituation of the place from the Magnetick Poles, but are contrary; as all the West-Indies according to the Poles should be Easterly, and they are Westerly. Which is by some Accidental Cause in the Earth; and their Motion, as I formerly said, is a forced Motion, and not Natural.

A.

He has clearly overthrown his main Doctrine. For to say the Motion of the Needle is forced and unnatural, is a most pityful shift, and manifestly false, no Motion being more constant or less accidental, notwithstanding the

Variation, to which the Inclinary Needle is no less subject than the Horizontal Needle.

B.

That which deceived him, was, that he thought them two sorts of Needles, forgetting what he had said of Normans Invention of the Inclinary Needle by the inclining of the Horizontal Needle, Pag. 11. For I will shew you that what he says is Easterly and should be Westerly, should be Easterly as it is. Consider the fourth Figure, in which B is the North-Pole, and B c 11 deg. 15 min. Easterly, which was the Variation at London in 1576 Easterly. Suppose A c to be the Needle, shall it not incline, as well here as at D a, and the Variation B c be Easterly? Again, D a is 11 deg. 15 min. and the Needle in D parallel to A B, and at a inclining also 11 deg. 15 min. Westerly. And is not the Variation there D a Westerly, with the North-point of the Needle in the Line a h?

A.

But the West-Indies are not in this Hemisphere B C D E. The Variation therefore will proceed in an Arc of the opposite Hemisphere, which is Westerly.

B.

I believe he might think so, forgetting that he and his Compass were on the Superficies of the Earth, and fancying them in the Center at A.

A.

'Tis like enough. If we had a straight Line exactly equal to the Arc of a Quadrant, I think it would very much facilitate the Doctrine of Spherical

Triangles.

B.

When you have done with your Questions of Natural Philosophy, I will give you a clear Demonstration of the equality of a straight Line to the Arc of a Quadrant, which, if it satisfie you, you may carry with you, and try thereby if you can find the Angle of a Spherical Triangle given.

A.

It is time now to give over. And at our next meeting I desire your opinion concerning the Causes of Diaphaniety, and Refraction. This Copernicus has done much more than he thought of. For he has not only restored to us Astronomy, but also made the way open to Physiology.

CAP. X. OF TRANSPARENCE, REFRACTION; AND OF THE POWER OF THE EARTH TO PRODUCE LIVING CREATURES.

A.

THINKING upon what you said yesterday, it lookt like a generation of living Creatures. I saw the love between the Loadstone and the Iron in their mutual attraction, their engendring in their close and contrary Motion; and their issue in the Iron, which being touch'd hath the same attractive vertue. Now seeing they have the same internal motion of parts with that of the Earth, why should not their substance be the same, or very near a kin?

B.

The most of them (if not all) that have written of this Subject, when they call the Loadstone a Terrella, seem to think as you do. But I, except I could find proof for it, will not affirm it. For the Earth attracteth all kind of Bodies but Air, and the Loadstone none but Iron. The Earth is a Star, and it were too bold to pronounce any sentence of its substance, especially of the Planets, that are so lapt up in their several Coats, as that they cannot work on our Eyes, or any Organ of our other Senses.

A.

I come therefore now to the business of the day. Seeing all Generation, Augmentation, and Alteration is local Motion, how can a Body not Transparent be made Transparent?

B.

I think it can never be done by the Art of Man. For as I said of Hard and Heavy Bodies in the Creation, so I think of Diaphanous, that the very same Individual Body which was not Transparent then, shall never be made Transparent by Humane Art.

A.

Do not you see that every day Men make Glass, and other Diaphanous Bodies not much inferior in beauty to the fairest Gems?

B.

It is one thing to make one Transparent of many by mixture, and another to make Transparent of not Transparent. Any very hard Stone, if it be beaten into small Sands, such as is used for Hour-Glasses, every one of those Sands, if you look upon it with a Microscope, you will find to be Transparent; and the harder and whiter the Stone is, so much the more Transparent, as I have seen in the Stone of which are made Milstones, which Stone is here called Greet. And I doubt not but the Sands of white Marble must be more Transparent. But there are no Sands so Transparent that they have not a scurf upon them as hard, perhaps, as the Stone it self; which they whose profession it is to make Glass, have the Art to scour and wash away. And therefore I think it no great wonder to bring those Sands into one Lump, though I know not how they do it.

A.

I know they do it with Lie made with a Salt extracted from the Ashes of an Herb, of which Salt they make a strong Lie, and mingle it with the Sand,

and then bake it.

B.

Like enough. But still it is a Compound of two Transparent Bodies, whereof one is the Natural Stone, the other is the Morter. This therefore doth not prove, that one and the same Body, of not Transparent can be made Transparent.

A.

Since they can make one Transparent Body of many, why do they not of a great many small sparks of natural Diamant compound one great one? It would bear the charges of all the Materials, and beside, enrich them.

B.

'Tis probable it would. But it may be they know no Salt that howsoever prepared, which (with how great a Fire soever) can make them melt. And, it may be the true Chrystal of the Mountain, which is found in great pieces in the Alps, is but a compound of many small ones, and made by the Earths Annual Motion. For it is a very swift Motion. Suppose now that within a very small Cavern of those Rocks whose smallest Atomes are Chrystal, and the Cavity fill'd with Air; and consider what a tumult would be made by the swift reciprocation of that Air; whether it would not in time separate those Atomes from the Rock, and jumbling them together make them rub off their scruf from one another, and by little and little to touch one another in polish'd plains, and consequently stick together, till in length of time they become one lump of clean Chrystal.

A.

I believe that the least parts of created substances lay mingled together at first, till it pleased God to separate all dissimilar natures, and congregate the similar, to which this Annual Motion is proper. But they say that Chrystal is found in the open Air hanging like Icicles upon the Rocks. Which (if true) defeats this supposition of a narrow Cavern. And therefore I must have some further experience of it before I make it my opinion. But howsoever, it still holds true that Diaphanous Bodies of all sorts, in their least parts, were made by God in the beginning of the World. But it may be true, notwithstanding those Icicles. For the force of the Air that could break off those Diaphanous Atomes in a Cavern, can do the same in the open Air. And I know that a less force of Air can break some Bodies into small pieces, not much less hard than Chystal, by corrupting them.

B.

That which you now have said is somewhat. But I deny not the possibility, but only doubt of the Operation. You may therefore pass to some other Question.

A.

Well, I will ask you then a Question about Refraction. I know already that for the Cause of Refraction (when the Light falleth through a thinner Medium upon a thicker) you assign the resistance of the thicker Body; but you do not mean there by Rarum and Densum, two Bodies whereof in equal spaces one has more substance in it than the other.

B.

No. For equal spaces contain equal Bodies. But I mean by Densum any Body which more resisteth the Motion of the Air, and by Rarum that which

resisteth less.

A.

But you have not declared in what that resistance consisteth.

B.

I suppose it proceedeth from the Hardness.

A.

But from thence it will follow, that all Transparent Bodies that equally refract are equally Hard. Which I think is not true, because the Refraction of Glass is not greater (at least in comparison of their Hardnesses) than that of Water.

B.

I confess it. Therefore I think we must take in Gravity to a Share in the production of this Refraction. For I never considered Refraction but in Glass; because my business then was only to find the Causes of the Phaenomena of Telescopes and Microscopes. Let therefore A B (in Fig. 7.) be a hard, and consequently, a heavy Body. And from above (as from the Sun) let C A be the line of Incidence, and produced to D. And draw A E perpendicular to A B. It is manifest that the Hardness in A B shall turn the stream of the Light inwards toward A E, suppose in the line A e. It is also evident that the Endeavour in B, which is (being heavy) downward, shall turn the stream again inward, towards A E as in A b. Thus it is in Refraction from the Sun downwards. In like manner, if the light come from below, as from a Candle in the point D, the line of Incidence will be D A, and produced will pass to C. And the resistance of the Hardness in A will turn

the stream A C inward, suppose into B l, and make C l equal to D e. For passing into a thinner Medium, it will depart from the perpendicular in an Angle equal to the Angle D A e, by which it came nearer to it in A e. So also the resistance of the Gravity in the point A shall turn the stream of the Light into the line A i, and make the Angle l A i equal to the Angle e A b. And thus you see in what manner, though not in what proportion Hardness and Gravity conjoyn their resistance in the Causing of Refraction.

A.

But you proved yesterday, that a heavy Body does not Gravitate upon a Body equally heavy. Now this A B has upper parts, and lower parts; and if the upper parts do not Gravitate upon the lower parts, how can there be any Endeavour at all downward to contribute to the Refraction?

B.

I told you yesterday, that when a heavy Body was set upon another Body heavier or harder than it self, the Endeavour of it downward was diverted another way, but not that it was extinguished. But in this case, where it lyeth upon Air, the first endeavour of the lowest part worketh downward. For neither Motion nor Body can be utterly extinguished by a less than an Omnipotent power. All Bodies as long as they are Bodies, are in Motion one way or other, though the farther it be communicated, so much the less.

A.

But since you hold that Motion is propagated through all Bodies, how hard or heavy soever they be, I see no Cause but that all Bodies should be Transparent.

B.

There are divers Causes that take away Transparency. First, if the Body be not perfectly Homogeneous, that is to say, if the smallest parts of it be not all precisely of the same nature, or do not so touch one another as to leave no Vacuum within it; or though they touch, if they be not as hard in the contact as in any other line. For then the Refractions will be so changed both in their direction, and in their strength, as that no Light shall come through it to the Eye; as in Wood and ordinary Stone and Metal. Secondly, The Gravity and hardness may be so great, as to make the Angle refracted so great, as the second Refraction shall not direct the beam of light to the Eye; as if the Angle of Refraction were $D A E$, the Refracted line would be perpendicular to $A B$, and never come to the line $A D$, in which is the Eye.

A.

To know how much of the Refraction is due to the Hardness, and how much to the Gravity, I believe it is impossible, though the Quantity of the whole be easily measured in a Diaphanous Body given. And both you and Mr. Warner have demonstrated, that as the Sine of the Angle Refracted in one Inclination is to the Sine of the Angle Refracted in another Inclination, so is the Sine of one Inclination to the Sine of the Angle of the other Inclination. Which Demonstrations are both published by Mersennus in the end of the first Volume of his *Cogitata Physico-Mathematica*. But since there be many Bodies, through which though there pass Light enough, yet no Object appears through them to the Eye, what is the reason of that?

B.

You mean Paper. For Paper-Windows will enlighten a Room, and yet not show the Image of an Object without the Room. But 'tis because there are

in Paper abundance of pores, through which the Air passing moveth the Air within; by the Reflections whereof any thing within may be seen. And in the same Paper there are again as many parts not Transparent, through which the Air cannot pass, but must be reflected first to all parts of the Object, and from them again to the Paper; and at the Paper either reflected again or transmitted, according as it falls upon Pores or not Pores; so that the Light from the Object can never come together at the Eye.

A.

There belongs yet to this Subject the Causes of the diversity of Colours. But I am so well satisfied with that which you have written of it in the 24th Chapter of your Book de Corpore, that I need not trouble you further in it. And now I have but one Question more to ask you, which I thought upon last night. I have read in an antient Historian that Living Creatures after a great deluge were produced by the Earth, which being then very soft, there were bred in it (it may be by the rapid Motion of the Sun) many Blisters, which in time breaking, brought forth (like so many Eggs) all manner of living Creatures great and small, which since it is grown hard it cannot do. What think you of it?

B.

It is true that the Earth produced the first living Creatures of all sorts but Man. For God said, (Gen. 1. vers. 24.) Let the Earth produce every living Creature, Cattle, and creeping thing, &c. But then again (ver. 25.) it is said that God made the Beast of the Earth, &c. So that it is evident that God gave unto the Earth that vertue. Which vertue must needs consist in Motion, because all Generation is Motion. But Man, though the same day, was made afterward.

A.

Why hath not the Earth the same vertue now? Is not the Sun the same it was? Or is there no Earth now soft enough?

B.

Yes. And it may be the Earth may yet produce some very small Living Creatures: And perhaps Male and Female. For the smallest Creatures which we take notice of, do engender, though they do not all by conjunction; therefore if the Earth produce living Creatures at this day, God did not absolutely rest from all his Works on the seventh day, but (as it is Ca. ver. 2.) he rested from all the work he had made. And therefore it is no harm to think that God worketh still, and when and where and what he pleaseth. Beside, 'tis very hard to believe, that to produce Male and Female, and all that belongs thereto, as also the several and curious Organs of Sense and Memory, could be the work of any thing that had not understanding. From whence, I think we may conclude, that whatsoever was made after the Creation, was a new Creature made by God no otherwise than the first Creatures were, excepting only Man.

A.

They are then in an Errour that think there are no more different kinds of Animals in the World now, than there were in the Ark of Noah.

B.

Yes doubtless. For they have no Text of Scripture from which it can be proved.

A.

The Questions of Nature which I could yet propound are innumerable. And since I cannot go through them, I must give over somewhere, and why not here? For I have troubled you enough, though I hope you will forgive me.

B.

So God forgive us both as we do one another. But forget not to take with you the Demonstration of a straight Line equal to an Arc of a Circle.

FINIS.

An Historical Narration concerning Hersey and the Punishment Thereof

1680 EDITION

AN HISTORICAL NARRATION CONCERNING HERESIE, AND THE PUNISHMENT THEREOF.

THE word Heresie is Greek, and signifies a taking of any thing, and particularly the taking of an Opinion. After the study of Philosophy begun in Greece, and the Philosophers disagreeing amongst themselves, had started many Questions, not onely about things Natural, but also Moral and Civil; because every man took what Opinion he pleased, each several Opinion was called a Heresie; which signified no more than a private Opinion, without reference to truth or falshood. The beginners of these Heresies were chiefly Pythagoras, Epicurus, Zeno, Plato, and Aristotle; men who as they held many Errours, so also found they out many true and useful Doctrines, in all kinds of Learning: and for that cause were well esteemed of by the greatest Personages of their own times; and so also were some few of their Followers.

But the rest, ignorant men, and very often needy Knaves, having learned by heart the Tenets, some of Pythagoras, some of Epicurus, some of Zeno, some of Plato, some of Aristotle, and pretending to take after them, made use thereof to get their Living by the teaching of Rich mens Children that happened to be in love with these famous Names. But by their ignorant Discourse, sordid and ridiculous Manners, they were generally despised, of what Sect or Heresie soever they were; whether they were Pythagoreans, or Epicureans, or Stoicks (who followed Zeno) or Academicks (Followers of

Plato) or Peripateticks (Followers of Aristotle:) For these were the names of Heresies, or (as the Latines call them) Sects, à sequendo, so much talkt of from after the time of Alexander till this present day, and that have perpetually troubled or deceived the people with whom they lived, and were never more numerous than in the time of the Primitive Church.

But the Heresie of Aristotle was more predominant than any, or perhaps than all the rest: nor was the name of Heresie then a disgrace, nor the word Heretick at all in use, though the several Sects, especially the Epicureans and the Stoicks, hated one another; and the Stoicks being the fiercer men, used to revile those that differed from them with the most despicable words they could invent.

It cannot be doubted, but that, by the preaching of the Apostles and Disciples of Christ in Greece and other parts of the Roman Empire, full of these Philosophers, many thousands of men were converted to the Christian Faith, some really, and some feignedly, for factious ends, or for need; (for Christians lived then in common, and were charitable:) and because most of these Philosophers had better skill in Disputing and Oratory than the Common people, and thereby were better qualified both to defend and propagate the Gospel, there is no doubt (I say) but most of the Pastors of the Primitive Church were for that reason chosen out of the number of these Philosophers; who retaining still many Doctrines which they had taken up on the authority of their former Masters, whom they had in reverence, endeavoured many of them to draw the Scriptures every one to his own Heresie. And thus at first entred Heresie into the Church of Christ. Yet these men were all of them Christians, as they were when they were first baptized: Nor did they deny the Authority of those Writings which were left them by the Apostles and Evangelists, but interpreted them many times with a bias to their former Philosophy. And this Dissention amongst themselves, was a great scandal to the Unbelievers, and which not onely obstructed the

way of the Gospel, but also drew scorn and greater persecution upon the Church.

For remedy whereof, the chief Pastors of Churches did use, at the rising of any new Opinion, to assemble themselves for the examining and determining of the same; wherein, if the Author of the Opinion were convinced of his Errour, and subscribed to the Sentence of the Church assembled, then all was well again: but if he still persisted in it, they laid him aside, and considered him but as an Heathen man; which, to an unfeigned Christian, was a great ignominy, and of force to make him consider better of his own Doctrine; and sometimes brought him to the acknowledgment of the Truth. But other punishment they could inflict none, that being a right appropriated to the Civil Power. So that all the punishment the Church could inflict, was onely Ignominy; and that among the faithful, consisting in this, that his company was by all the Godly avoided, and he himself branded with the name of Heretick in opposition to the whole Church, that condemned his Doctrine. So that Catholick and Heretick were terms relative; and here it was that Heretick became to be a Name, and a name of disgrace, both together.

The first and most troublesome Heresies in the Primitive Church, were about the Trinity. For (according to the usual curiosity of Natural Philosophers) they could not abstain from disputing the very first Principles of Christianity, into which they were baptized, In the name of the Father, the Son, and the Holy Ghost. Some there were that made them allegorical. Others would make one Creator of Good, and another of Evil; which was in effect to set up two Gods, one contrary to another; supposing that causation of evil could not be attributed to God, without Impiety. From which Doctrine they are not far distant, that now make the first cause of sinful actions to be every man as to his own sin. Others there were that would have God to be a body with parts organical, as Face, Hands, Fore-parts and

Back-parts. Others, that Christ had no real body, but was a meer Phantasm: (for Phantasms were taken then, and have been ever since, by unlearned and superstitious men, for things real and subsistent). Others denied the Divinity of Christ. Others, that Christ being God and Man, was two Persons. Others confest he was one Person, and withal that he had but one Nature. And a great many other Heresies arose from the too much adherence to the Philosophy of those times, whereof some were suppress for a time by St. John's publishing his Gospel, and some by their own unreasonableness vanished, and some lasted till the time of Constantine the Great, and after.

When Constantine the Great (made so by the assistance and valour of the Christian Souldiers) had attained to be the onely Roman Emperour, he also himself became a Christian, and caused the Temples of the Heathen gods to be demolished, and authorized Christian Religion onely to be publick. But in the latter end of his time, there arose a Dispute in the City of Alexandria, between Alexander the Bishop and Arius a Presbyter of the same City; wherein Arius maintained, first, That Christ was inferiour to his Father; and afterwards, That he was no God, alleadging the words of Christ, My Father is greater than I. The Bishop on the contrary alleadging the words of St. John, And the Word was God; and the words of St. Thomas, My Lord and my God. This Controversie presently amongst the Inhabitants and Souldiers of Alexandria became a Quarrel, and was the cause of much Bloudshed in and about the City; and was likely then to spread further, as afterwards it did. This so far concerned the Emperours Civil Government, that he thought it necessary to call a General Council of all the Bishops and other eminent Divines throughout the Roman Empire, to meet at the City of Nice. When they were assembled, they presented the Emperour with Libels of Accusation one against another. When he had received these Libels into his hands, he made an Oration to the Fathers assembled, exhorting them to agree, and to fall in hand with the settlement of the Articles of Faith, for

which cause he had assembled them, saying, Whatsoever they should decree therein, he would cause to be observed. This may perhaps seem a greater indifferency than would in these days be approved of. But so it is in the History; and the Articles of Faith necessary to Salvation, were not thought then to be so many as afterwards they were defined to be by the Church of Rome.

When Constantine had ended his Oration, he caused the aforesaid Libels to be cast into the fire, as became a wise King and a charitable Christian. This done, the Fathers fell in hand with their business, and following the method of a former Creed, called now The Apostles Creed, made a Confession of Faith, viz. I believe in one God, the Father Almighty, maker of Heaven and Earth, and of all things visible and invisible, (in which is condemned the Polytheism of the Gentiles.) And in one Lord Iesus Christ the onely begotten Son of God, (against the many sons of the many gods of the Heathen.) Begotten of his Father before all worlds, God of God, (against the Arians) Uery God of very God, (against the Valentinians, and against the Heresie of Apelles, and others, who made Christ a meer Phantasm.) Light of Light, [This was put in for explication, and used before to that purpose, by Tertullian.] Begotten, not made, being of one substance with the Father.

In this again they condemn the Doctrine of Arius: for this word Of one substance, in Latine Consubstantialis, but in Greek *ὁμοούσιος*, that is, Of one Essence, was put as a Touchstone to discern an Arian from a Catholick: And much ado there was about it. Constantine himself, at the passing of this Creed, took notice of it for a hard word; but yet approved of it, saying, That in a divine Mystery it was fit to use divina & arcana Verba; that is, divine words, and hidden from humane understanding; calling that word *ὁμοούσιος* divine, not because it was in the divine Scripture, (for it is not there) but because it was to him Arcanum, that is, not sufficiently understood. And in this again appeared the indifferency of the Emperour, and that he had for his

end, in the calling of the Synod, not so much the Truth, as the Uniformity of the Doctrine, and peace of his People that depended on it. The cause of the obscurity of this word ὁμοευσίος, proceeded chiefly from the difference between the Greek and Roman Dialect, in the Philosophy of the Peripateticks. The first Principle of Religion in all Nations, is, That God is, that is to say, that God really is Something, and not a meer fancy; but that which is really something, is considerable alone by it self, as being somewhere. In which sence a man is a thing real: for I can consider him to be, without considering any other thing to be besides him. And for the same reason, the Earth, the Air, the Stars, Heaven, and their parts, are all of them things real. And because whatsoever is real here, or there, or in any place, has Dimensions, that is to say, Magnitude; and that which hath Magnitude, whether it be visible or invisible, is called by all the Learned a Body, if it be finite; and Body or Corporeal, if it be infinite: it followeth, that all real things, in that they are somewhere, are Corporeal. On the contrary, Essence, Deity, Humanity, and such-like names, signifie nothing that can be considered, without first considering there is an Ens, a God, a Man, &c. So also if there be any real thing that is white or black, hot or cold, the same may be considered by it self; but whiteness, blackness, heat, coldness, cannot be considered, unless it be first supposed that there is some real thing to which they are attributed. These real things are called by the Latine Philosophers, *Entia subjecta, substantiae*; and by the Greek Philosophers, τὰ ὄντα ὑποκειμενα, ὑποστάμενα. The other, which are Incorporeal, are called by the Greek Philosophers, οὐσία συμβεβηχότα, φαντάσματα; but most of the Latine Philosophers use to convert οὐσία into substantia, and so confound real and corpororeal things with incorporeal; which is not well: for Essence and substance signifie divers things. And this mistake is received, and continues

still in these parts, in all Disputes both of Philosophy and Divinity: for in truth *Essentia* signifies no more, than if we should talk ridiculously of the Isness of the thing that Is. [By whom all things were made.] This is proved out of St. John, ca. vers. 1, 2, 3. and Heb. ca. vers. 3. and that again out of Gen. 1. where God is said to create every thing by his sole Word, as when he said, Let there be Light, and there was Light. And then, that Christ was that Word, and in the beginning with God, may be gathered out of divers places of Moses, David, and other of the Prophets. Nor was it ever questioned amongst Christians (except by the Arians) but that Christ was God Eternal, and his Incarnation eternally decreed. But the Fathers, all that write Expositions on this Creed, could not forbear to philosophize upon it, and most of them out of the Principles of Aristotle: which are the same the School-men now use; as may partly appear by this, that many of them, amongst their Treatises of Religion, have affected to publish Logick and Physick Principles according to the sense of Aristotle; as Athanasius, and Damascene. And so some later Divines of Note, as Zanchius, still confounding the Concret with the Abstract, Deus with Deitas, Ens with Essentia, Sapiens with Sapientia, Aeternus with Aeternitas. If it be for exact and rigid Truth sake, why do they not say also, that Holiness is a Holy man, Covetousness a Covetous man, Hypocrisie an Hypocrite, and Drunkenness a Drunkard, and the like, but that it is an Error? The Fathers agree that the Wisdome of God is the eternal Son of God, by whom all things were made, and that he was incarnate by the Holy Ghost, if they meant it in the Abstract: For if Deitas abstracted be Deus, we make two Gods of one. This was well understood by Damascene, in his Treatise *De Fide Orthodoxâ*, (which is an Exposition of the Nicene Creed) where he denies absolutely that Deitas is Deus, lest (seeing God was made man) it should follow, the Deity was made man; which is contrary to the Doctrine of all the Nicene Fathers. The Attributes therefore of God in the Abstract, when they are put

for God, are put Metonymically; which is a common thing in Scripture; for Example, Prov. 8.28. where it is said, Before the mountains were settled, before the Hills was I brought forth; the Wisdome there spoken of being the Wisdome of God, signifies the same with the wise God. This kinde of speaking is also ordinary in all Languages. This considered, such abstracted words ought not to be used in Arguing, and especially in the deducing the Articles of our Faith; though in the Language of God's eternal Worship, and in all Godly Discourses, they cannot be avoided: and the Creed it self is less difficult to be assented to in its own words, than in all such Expositions of the Fathers. Who for us men and our Salvation came down from Heaven, and was incarnate by the Holy Ghost of the Uirgin Mary, and was made Man. I have not read of any exception to this: For where Athanasius in his Creed says of the Son, He was not made, but begotten, it is to be understood of the Son as he was God Eternal; whereas here it is spoken of the Son as he is man. And of the Son also as he was man, it may be said he was begotten of the Holy Ghost; for a woman conceiveth not but of him that begetteth; which is also confirmed, Mat. 1.20. That which is begotten in her (...) is of the Holy Ghost. And was also Crucified for us under Pontius Pilate: He suffered and was buried: And the third day he rose again according to the Scriptures, and ascended into Heaven: and sitteth on the right hand of the Father; And he shall come again with Glory to judge both the Quick and the Dead. Whose Kingdome shall have no end. [Of this part of the Creed I have not met with any doubt made by any Christian.] Hither the Council of Nice proceeded in their general Confession of Faith, and no further.

This finished, some of the Bishops present at the Council (seventeen or eighteen, whereof Eusebius Bishop of Caesarea was one) not sufficiently satisfied, refused to subscribe till this Doctrine of ... should be better explained. Thereupon the Council Decreed, that whosoever shall say that God hath parts, shall be Anathematized; to which the said Bishops

subscribed. And Eusebius by Order of the Council wrote a Letter, the Copies whereof were sent to every absent Bishop, that being satisfied with the reason of their subscribing, they also should subscribe. The reason they gave of their Subscription was this, That they had now a form of words prescribed, by which, as a Rule, they might guide themselves so, as not to violate the Peace of the Church. By this it is manifest, that no man was an Heretick, but he that in plain and direct words contradicted that Form by the Church prescribed, and that no man could be made an Heretick by Consequence. And because the said Form was not put into the body of the Creed, but directed only to the Bishops, there was no reason to punish any Lay-person that should speak to the contrary.

But what was the meaning of this Doctrine, That God has no parts? Was it made Heresie to say, that God, who is a real substance, cannot be considered or spoken of as here, or there, or any where, which are parts of places? Or that there is any real thing without length every way, that is to say, which hath no Magnitude at all, finite nor infinite? Or is there any whole substance, whose two halves or three thirds are not the same with that whole? Or did they mean to condemn the Argument of Tertullian, by which he confuted Apelles and other Hereticks of his time; namely, Whatsoever was not Corporeal, was nothing but Fantasm, and not Corporeal, for Heretical? No certainly, no Divines say that. They went to establish the Doctrine of One individual God in Trinity; to abolish the diversity of species in God, not the distinction of here and there in substance. When St. Paul asked the Corinthians, Is Christ divided? he did not think they thought him impossible to be considered as having hands and feet, but that they might think him (according to the manner of the Gentiles) one of the Sons of God, as Arius did; but not the only begotten Son of God. And thus also it is expounded in the Creed of Athanasius, who was present in that Council, by these words, Not confounding the Persons, nor dividing

the Substances; that is to say, that God is not divided into three Persons, as man is divided into Peter, James, and John; nor are the three persons one and the same person. But Aristotle, and from him all the Greek Fathers, and other Learned Men, when they distinguish the general Latitude of a word, they call it Division; as when they divide Animal into Man and Beast, they call these ..., Species; and when they again divide the species Man, into Peter and John, they call these ..., partes individuae. And by this confounding the division of the substance with the distinction of words, divers men have been led into the Error of attributing to God a Name, which is not the name of any substance at all, viz. Incorporeal.

By these words, God has no parts, thus explained, together with the part of the Creed which was at that time agreed on, many of those Heresies which were antecedent to that first General Council, were condemned; as that of Menes, who appeared about thirty years before the Reign of Constantine, by the first Article, I believe in one God; though in other words it seems to me to remain still in the Doctrine of the Church of Rome, which so ascribeth a Liberty of the Will to Men, as that their Will and Purpose to commit sin, should not proceed from the Cause of all things, God; but originally from themselves, or from the Devil. It may seem perhaps to some, that by the same words the Anthropomorphites also were then Condemned: And certainly, if by Parts were meant not persons Individual, but Pieces, they were Condemned: for Face, Arms, Feet, and the like, are pieces. But this cannot be, for the Anthropomorphites appeared not till the time of Valens the Emperour, which was after the Council of Nice between forty and fifty years; and was not condemned till the second General Council at Constantinople.

Now for the Punishment of Hereticks ordained by Constantine, we read of none; but that Ecclesiastical Officers, Bishops and other Preachers, if they refused to subscribe to this Faith, or taught the contrary Doctrine, were

for the first Fault Deprived of their Offices, and for the second Banished. And thus did Heresie, which at first was the name of private Opinion, and no Crime, by vertue of a Law of the Emperour, made only for the Peace of the Church, become a Crime in a Pastor, and punishable with Deprivation first, and next with Banishment.

After this part of the Creed was thus established, there arose presently many new Heresies, partly about the Interpretation of it, and partly about the Holy Ghost, of which the Nicene Council had not determined. Concerning the part established, there arose Disputes about the Nature of Christ, and the word Hypostasis, id est, Substance; for of Persons there was yet no mention made, the Creed being written in Greek, in which Language there is no word that answereth to the Latine word Persona. And the Union, as the Fathers called it, of the Humane and Divine Nature in Christ, Hypostatical, caused Eutyches, and after him Dioscorus, to affirm, there was but one Nature in Christ; thinking that whensoever two things are united, they are one: and this was condemned as Arianism in the Councils of Constantinople and Ephesus. Others, because they thought two living and rational Substances, such as are God and Man, must needs be also two Hypostases, maintained that Christ had two Hypostases: But these were two Heresies condemned together. Then concerning the Holy Ghost, Nestorius Bishop of Constantinople, and some others, denied the Divinity thereof. And whereas about seventy years before the Nicene Council, there had been holden a Provincial Council at Carthage, wherein it was Decreed, that those Christians which in the Persecutions had denied the Faith of Christ, should not be received again into the Church, unless they were again baptized: This also was condemned, though the President in that Council were that most sincere and pious Christian, Cyprian. But at last the Creed was made up entire as we have it, in the Calcedonian Council, by addition of these words, And I believe in the Holy Ghost, the Lord and Giver of Life, who

proceedeth from the Father and the Son. Who with the Father & the Son together is Worshipped and Glorified. Who spake by the Prophets. And I believe one Catholick & Apostolick Church. I acknowledge one Baptism for the Remission of Sins. And I look for the Resurrection of the Dead, and the Life of the World to come. In this addition are condemned, first the Nestorians and others, in these words, Who with the Father and the Son together is worshipped and glorified: And secondly the Doctrine of the Council of Carthage, in these words, I believe one Baptism for the Remission of Sins: For one Baptism is not there put as opposite to several sorts or manners of Baptism, but to the iteration of it: St. Cyprian was a better Christian than to allow any Baptism that was not in the Name of the Father, Son, and Holy Ghost. In the General Confession of Faith contained in the Creed called the Nicene Creed, there is no mention of Hypostasis, nor of Hypostatical Union, nor of Corporeal, nor of Incorporeal, nor of Parts; the understanding of which words being not required of the Vulgar, but only of the Pastors, whose disagreement else might trouble the Church; nor were such Points necessary to Salvation, but set abroad for ostentation of Learning, or else to dazle men, with design to lead them towards some ends of their own. The Changes of prevalence in the Empire between the Catholicks and the Arians, and how the great Athanasius, the most fierce of the Catholicks, was banished by Constantine, and afterwards restored, and again banished, I let pass; only it is to be remembred, that Athanasius composed his Creed then, when (banished) he was in Rome, Liberius being Pope; by whom, as is most likely, the word Hypostasis, as it was in Athanasius's Creed, was disliked: For the Roman Church could never be brought to receive it, but instead thereof used their own word Persona. But the first and last words of that Creed the Church of Rome refused not: for they make every Article, not only those of the body of the Creed, but all the Definitions of the Nicene Fathers to be such, as a man cannot be saved,

unless he believe them all stedfastly; though made only for Peace sake, and to unite the mindes of the Clergy, whose Disputes were like to trouble the Peace of the Empire. After these four first General Councils, the Power of the Roman Church grew up apace; and either by the negligence or weakness of the succeeding Emperours, the Pope did what he pleased in Religion. There was no Doctrine which tended to the Power Ecclesiastical, or to the Reverence of the Clergy, the contradiction whereof was not by one Council or another made Heresie, and punished arbitrarily by the Emperours with Banishment or Death. And at last Kings themselves, and Commonwealths, unless they purged their Dominions of Hereticks, were Excommunicated, Interdicted, and their Subjects let loose upon them by the Pope; insomuch as to an ingenuous and serious Christian, there was nothing so dangerous as to enquire concerning his own Salvation, of the Holy Scripture; the careless cold Christian was safe, and the skilful Hypocrite a Saint. But this is a Story so well known, as I need not insist upon it any longer, but proceed to the Hereticks here in England, and what Punishments were ordained for them by Acts of Parliament. All this while the Penal Laws against Hereticks were such, as the several Princes and States, in their own Dominions, thought fit to enact. The Edicts of the Emperours made their Punishments Capital, but for the manner of the Execution, left it to the Prefects of Provinces: and when other Kings and States intended (according to the Laws of the Roman Church) to extirpate Hereticks, they ordained such Punishment as they pleased. And the first Law that was here made for the punishments of Hereticks called Lollards, and mentioned in the Statutes, was in the fifth year of the Reign of Richard the Second, occasioned by the Doctrine of John Wickliff and his Followers; which Wickliff, because no Law was yet ordained for his punishment in Parliament, by the favour of John of Gaunt, the Kings Son, escaped. But in the fifth year of the next King, which was Richard the Second, there passed an Act of Parliament to this effect; That

Sheriffs and some others should have Commissions to apprehend such as were certified by the Prelates to be Preachers of Heresie, their Fautors, Maintainers and Abettors, and to hold them in strong Prison, till they should justifie themselves, according to the Law of Holy Church. So that hitherto there was no Law in England, by which a Heretick could be put to Death, or otherways punished, than by imprisoning him till he was reconciled to the Church. After this, in the next Kings Reign, which was Henry the Fourth, Son of John of Gaunt by whom Wickliffe had been favoured, and who in his aspiring to the Crown had needed the good Will of the Bishops, was made a Law, in the second Year of his Reign, wherein it was Enacted, That every Ordinary may convene before him, and imprison any person suspected of Heresie; and that an obstinate Heretick shall be burnt before the People.

In the next King's Reign, which was Henry the Fifth, in his Second year, was made an Act of Parliament, wherein it is declared, that the intent of Hereticks, called Lollards, was to subvert the Christian Faith, the Law of God, the Church and the Realm: And, that an Heretick convict should forfeit all his Fee-simple Lands, Goods and Chattels, besides the Punishment of Burning. Again, in the Five and Twentieth Year of King Henry the Eighth, it was Enacted, That an Heretick convict shall abjure his Heresies, and refusing so to do, or relapsing, shall be burnt in open place, for example of others. This Act was made after the putting down of the Pope's Authority: and by this it appears, that King Henry the Eighth intended no farther alteration in Religion, than the recovering of his own Right Ecclesiastical. But in the first year of his Son King Edward the Sixth was made an Act, by which were repealed not only this Act, but also all former Acts concerning Doctrines, or matters of Religion; So that at this time there was no Law at all for the punishment of Hereticks.

Again, in the Parliament of the first and second Year of Queen Mary, this Act of 1 Edw. 6. was not repealed, but made useless, by reviving the Statute of 25 Henr. 8. and freely put it in execution; insomuch as it was Debated, Whether or no they should proceed upon that Statute against the Lady Elizabeth, the Queens Sister.

The Lady Elizabeth not long after (by the Death of Queen Mary coming to the Crown) in the fifth Year of her Reign, by Act of Parliament repealed in the first place all the Laws Ecclesiastical of Queen Mary, with all other former Laws concerning the punishments of Hereticks, nor did she Enact any other Punishments in their place. In the second place it was Enacted, That the Queen by her Letters Patents should give a Commission to the Bishops, with certain other persons, in her Majesties Name, to execute the Power Ecclesiastical; in which Commission the Commissioners were forbidden to adjudge any thing to be Heresie, which was not declared to be Heresie by some of the first four General Councils: but there was no mention made of General Councils, but onely in that branch of the Act which Authorized that Commission, commonly called The High Commission; nor was there in that Commission any thing concerning how Hereticks were to be punished, but it was granted to them, that they might declare or not declare, as they pleased, to be Heresie or not Heresie, any of those Doctrines which had been Condemned for Heresie in the first Four General Councils. So that during the time that the said High Commission was in being, there was no Statute by which a Heretick could be punished otherways, than by the ordinary Censures of the Church; nor Doctrine accounted Heresie, unless the Commissioners had actually declared and published, That all that which was made Heresie by those Four Councils, should be Heresie also now: but I never heard that any such Declaration was made either by Proclamation, or by Recording it in Churches, or by publick Printing, as in penal Laws is necessary; the breaches of it are

excused by ignorance: besides, if Heresie had been made Capital, or otherwise civilly punishable, either the Four General Councils themselves, or at least the Points condemned in them ought to have been Printed or put into Parish-Churches in English, because without it, no man could know how to beware of offending against them.

Some man may perhaps ask, whether no body were Condemned and burnt for Heresie, during the time of the High Commission.

I have heard there w[•]re: but they which approve such executions, may peradventure know better grounds for them then I do; but those grounds are very well worthy to be enquired after.

Lastly, in the seventeenth year of the Reign of King Charles the First, shortly after that the Scots had Rebelliously put down the Episcopal Government in Scotland, the Presbyterians of England endeavoured the same here. The King, though he saw the Rebels ready to take the Field, would not condescend to that; but yet in hope to appease them, was content to pass an Act of Parliament for the abolishing the High Commission. But though the High Commission were taken away, yet the Parliament having other ends besides the setting up of the Presbyterate, pursued the Rebellion, and put down both Episcopacy and Monarchy, erecting a power by them called The Common-wealth by others the Rump, which men obeyed not out of Duty, but for fear, nor was there any humane Laws left in force to restrain any man from Preaching or Writing any Doctrine concerning Religion that he pleased; and in this heat of the War, it was impossible to disturb the Peace of the State, which then was none.

And in this time it was, that a Book called Leviathan, was written in defence of the Kings Power, Temporal and Spiritual, without any word against Episcopacy, or against any Bishop, or against the publick Doctrine of the Church. It pleas'd God about Twelve years after the Usurpation of this Rump, to Restore His most Gracious Majesty that now is, to his Fathers

Throne, and presently His Majesty restored the Bishops, and pardoned the Presbyterians; but then both the one and the other accused in Parliament this Book of Heresie, when neither the Bishops before the War had declared what was Heresie, when if they had, it had been made void by the putting down of the High Commission at the importunity of the Presbyterians: So fierce are men, for the most part, in dispute, where either their Learning or Power is debated, that they never think of the Laws, but as soon as they are offended, they cry out, Crucifige; forgetting what St. Paul saith, even in case of obstinate holding of an Errour, 2 Tim. 2.24, 25. The servant of the Lord must not strive, but be gentle unto all men, apt to teach, patient, in meekness instructing those that oppose, if God peradventure may give them repentance, to the acknowledging of the truth: Of which counsel, such fierceness as hath appeared in the Disputation of Divines, down from before the Council of Nice to this present time, is a Violation.

FINIS.

Behemoth

OR, THE LONG PARLIAMENT

MOLESWORTH 1840 EDITION

Published posthumously in 1681, *Behemoth* was written in 1668, but remained unpublished at the request of Charles II of England. It was intended as a follow-up to the infamously-received *Leviathan* (1651). The latter work served as a representation of an ideal political world, while *Behemoth* has been considered to be a contrasting treatise on what happens when the very worst abuses of government come to pass. Hobbes applies his understanding of the science of human nature to explain the causes of the English Civil War. The book is structured in the form of a discourse between two men. The first speaker, called only “A”, is an eyewitness and possible insider to the events of the English Civil War. The second speaker, referred to as “B”, is a student aiming to understand the breakdown in the government of England at that time.

Charles II had recognised the correctness of the account of events and issues, yet he was concerned that the book would not be well received. The king withheld his permission to publish, hoping that Hobbes would avoid further scandal and perhaps see his reputation as a great philosopher restored. The manuscript was pirated and printed in unauthorised editions in Europe during the 1670's, in a letter to his friend John Aubrey, Hobbes stated his disappointment with this turn of events. An official edition was released three years after Hobbes' death in 1679, by his literary agent William Croke.

**BEHEMOTH: THE HISTORY OF THE CAUSES OF THE
CIVIL WARS OF ENGLAND, AND OF THE COUNSELS
AND ARTIFICES BY WHICH THEY WERE CARRIED ON
FROM THE YEAR 1640 TO THE YEAR 1660.**

“*BELLA PER ANGLIACOS plusquam civilia campos,
Jusque datum sceleri loquimur.—*”

THE BOOKSELLER TO THE READER.

MY DUTY, AS well to the public as to the memory of Mr. Hobbes, has obliged me to procure with my utmost diligence, that these tracts should come forth with the most correct exactness.

I am compelled by the force of truth to declare, how much both the world and the memory of Mr. Hobbes have been abused by the several spurious editions of the History of the Civil Wars; wherein, by various and unskilful transcriptions, are committed above a thousand faults, and in above a hundred places whole lines left out, as I can make appear.

I must confess Mr. Hobbes, upon some considerations, was averse to the publishing thereof; but since it is impossible to suppress it, no book being more commonly sold by all booksellers, I hope I need not fear the offence of any man by doing right to the world and this work, which I now publish from the original manuscript, done by his own amanuensis, and given me by himself above twelve years since.

To this I have joined the treatise against Archbishop Bramhall, to prevent the like prejudice, which must certainly have fallen on it, there being so many false copies abroad, if not thus prevented; as also the Discourse of Heresy from a more correct copy; and have likewise annexed his Physical Problems, as they were translated by himself and presented to his Majesty, with the epistle prefixed, in the year 1662, at the same time they came forth in Latin.

These things premised, there remains nothing but to wish for myself good sale, to the buyer much pleasure and satisfaction.

Your humble servant,

William Crooke.

PART I. BEHEMOTH, OR THE EPITOME OF THE CIVIL WARS OF ENGLAND.

A.

If in time, as in place, there were degrees of high and low, I verily believe that the highest of time would be that which passed between 1640 and 1660. For he that thence, as from the Devil's Mountain, should have looked upon the world and observed the actions of men, especially in England, might have had a prospect of all kinds of injustice, and of all kinds of folly, that the world could afford, and how they were produced by their hypocrisy and self-conceit, whereof the one is double iniquity, and the other double folly.

B.

I should be glad to behold that prospect. You that have lived in that time and in that part of your age, wherein men used to see best into good and evil, I pray you set me, that could not see so well, upon the same mountain, by the relation of the actions you then saw, and of their causes, pretensions, justice, order, artifice, and event.

A.

In the year 1640, the government of England was monarchical; and the King that reigned, Charles, the first of that name, holding the sovereignty, by right of a descent continued above six hundred years, and from a much longer descent King of Scotland, and from the time of

his ancestor Henry II, King of Ireland; a man that wanted no virtue, either of body or mind, nor endeavoured anything more than to discharge his duty towards God, in the well governing of his subjects.

B.

How could he then miscarry, having in every county so many trained soldiers, as would, put together, have made an army of 60,000 men, and divers magazines of ammunition in places fortified?

A.

If those soldiers had been, as they and all other of his subjects ought to have been, at his Majesty's command, the peace and happiness of the three kingdoms had continued as it was left by King James. But the people were corrupted generally, and disobedient persons esteemed the best patriots.

B.

But sure there were men enough, besides those that were ill-affected, to have made an army sufficient to have kept the people from uniting into a body able to oppose him.

A.

Truly, I think, if the King had had money, he might have had soldiers enough in England. For there were very few of the common people that cared much for either of the causes, but would have taken any side for pay or plunder. But the King's treasury was very low, and his enemies, that pretended the people's ease from taxes, and other specious things,

had the command of the purses of the city of London, and of most cities and corporate towns in England, and of many particular persons besides.

B.

But how came the people to be so corrupted? And what kind of people were they that did so seduce them?

A.

The seducers were of divers sorts. One sort were ministers; ministers, as they called themselves, of Christ; and sometimes, in their sermons to the people, God's ambassadors; pretending to have a right from God to govern every one his parish, and their assembly the whole nation.

Secondly, there were a very great number, though not comparable to the other, which notwithstanding that the Pope's power in England, both temporal and ecclesiastical, had been by Act of Parliament abolished, did still retain a belief that we ought to be governed by the Pope, whom they pretended to be the vicar of Christ, and, in the right of Christ, to be the governor of all Christian people. And these were known by the name of Papists; as the ministers I mentioned before, were commonly called Presbyterians.

Thirdly, there were not a few, who in the beginning of the troubles were not discovered, but shortly after declared themselves for a liberty in religion, and those of different opinions one from another. Some of them, because they would have all congregations free and independent upon one another, were called Independents. Others that held baptism to infants, and such as understood not into what they are baptized, to be ineffectual, were called therefore Anabaptists. Others that held that Christ's kingdom was at this time to begin upon the earth, were called Fifth-monarchy-men; besides divers other sects, as Quakers, Adamites,

&c., whose names and peculiar doctrines I do not well remember. And these were the enemies which arose against his Majesty from the private interpretation of the Scripture, exposed to every man's scanning in his mother-tongue.

Fourthly, there were an exceeding great number of men of the better sort, that had been so educated, as that in their youth having read the books written by famous men of the ancient Grecian and Roman commonwealths concerning their polity and great actions; in which books the popular government was extolled by that glorious name of liberty, and monarchy disgraced by the name of tyranny; they became thereby in love with their forms of government. And out of these men were chosen the greatest part of the House of Commons, or if they were not the greatest part, yet by advantage of their eloquence, were always able to sway the rest.

Fifthly, the city of London and other great towns of trade, having in admiration the prosperity of the Low Countries after they had revolted from their monarch, the King of Spain, were inclined to think that the like change of government here, would to them produce the like prosperity.

Sixthly, there were a very great number that had either wasted their fortunes, or thought them too mean for the good parts they thought were in themselves; and more there were, that had able bodies, but saw no means how honestly to get their bread. These longed for a war, and hoped to maintain themselves hereafter by the lucky choosing of a party to side with, and consequently did for the most part serve under them that had greatest plenty of money.

Lastly, the people in general were so ignorant of their duty, as that not one perhaps of ten thousand knew what right any man had to command him, or what necessity there was of King or Commonwealth, for which

he was to part with his money against his will; but thought himself to be so much master of whatsoever he possessed, that it could not be taken from him upon any pretence of common safety without his own consent. King, they thought, was but a title of the highest honour, which gentleman, knight, baron, earl, duke, were but steps to ascend to, with the help of riches; they had no rule of equity, but precedents and custom; and he was thought wisest and fittest to be chosen for a Parliament, that was most averse to the granting of subsidies or other public payments.

B.

In such a constitution of people, methinks, the King is already ousted of his government, so as they need not have taken arms for it. For I cannot imagine how the King should come by any means to resist them.

A.

There was indeed very great difficulty in the business. But of that point you will be better informed in the pursuit of this narration.

B.

But I desire to know first, the several grounds of the pretences, both of the Pope and of the Presbyterians, by which they claim a right to govern us, as they do, in chief: and after that, from whence and when crept in the pretences of that Long Parliament, for a democracy.

A.

As for the Papists, they challenge this right from a text in Deut.xvii. 12, and other like texts, according to the old Latin translation in these

words: And he that out of pride shall refuse to obey the commandment of that priest, which shall at that time minister before the Lord thy God, that man shall by the sentence of the judge be put to death. And because, as the Jews were the people of God then, so is all Christendom the people of God now, they infer from thence, that the Pope, whom they pretend to be the high-priest of all Christian people, ought also to be obeyed in all his decrees by all Christians, upon pain of death. Again, whereas in the New Testament (Matth. xxviii. 18-20) Christ saith: All power is given unto me in heaven and in earth; go therefore and teach all nations, and baptize them in the name of the Father, and of the Son, and of the Holy Ghost, and teach them to observe all these things which I have commanded you: from thence they infer, that the command of the apostles was to be obeyed, and by consequence the nations were bound to be governed by them, and especially by the prince of the apostles, St. Peter, and by his successors the Popes of Rome.

B.

For the text in the Old Testament, I do not see how the commandment of God to the Jews, to obey their priests, can be interpreted to have the like force in the case of other nations Christian, more than upon nations unchristian (for all the world are God's people); unless we also grant, that a king cannot of an infidel be made Christian, without making himself subject to the laws of that apostle, or priest, or minister, that shall convert him. The Jews were a peculiar people of God, a sacerdotal kingdom, and bound to no other law but what first Moses, and afterwards every high-priest, did go and receive immediately from the mouth of God in Mount Sinai, in the tabernacle of the ark, and in the sanctum sanctorum of the temple. And for the text in St. Matthew, I know the words in the Gospel are not go teach, but go and make

disciples; and that there is a great difference between a subject and a disciple, and between teaching and commanding. And if such texts as these must be so interpreted, why do not Christian kings lay down their titles of majesty and sovereignty, and call themselves the Pope's lieutenants? But the doctors of the Romish Church seem to decline that title of absolute power, in their distinction of power spiritual and temporal; but this distinction I do not very well understand.

A.

By spiritual power they mean the power to determine points of faith, and to be judges in the inner court of conscience of moral duties, and a power to punish those men, that obey not their precepts, by ecclesiastical censure, that is, by excommunication. And this power, they say, the Pope hath immediately from Christ, without dependence upon any king or sovereign assembly, whose subjects they be that stand excommunicate. But for the power temporal, which consists in judging and punishing those actions that are done against the civil laws, they say, they do not pretend to it directly, but only indirectly, that is to say, so far forth as such actions tend to the hindrance or advancement of religion and good manners, which they mean when they say in ordine ad spiritualia.

B.

What power then is left to Kings and other civil sovereigns, which the Pope may not pretend to be his in ordine ad spiritualia?

A.

None, or very little. And this power not only the Pope pretends to in all Christendom; but some of his bishops also, in their several dioceses, jure divino, that is, immediately from Christ, without deriving it from the Pope.

B.

But what if a man refuse obedience to this pretended power of the Pope and his bishops? What harm can excommunication do him, especially if he be the subject of another sovereign?

A.

Very great harm. For by the Pope's or bishop's signification of it to the civil power, he shall be punished sufficiently.

B.

He were in an ill case then, that adventured to write or speak in defence of the civil power, that must be punished by him whose rights he defended, like Uzza, that was slain because he would needs, unbidden, put forth his hand to keep the ark from falling. But if a whole nation should revolt from the Pope at once, what effect could excommunication have upon the nation?

A.

Why, they should have no more mass said, at least by any of the Pope's priests. Besides, the Pope would have no more to do with them, but cast them off, and so they would be in the same case as if a nation should be cast off by their king, and left to be governed by themselves, or whom they would.

B.

This would not be taken so much for a punishment to the people, as to the King; and therefore when a Pope excommunicates a whole nation, methinks he rather excommunicates himself than them. But I pray you tell me, what were the rights that the Pope pretended to in the kingdoms of other princes?

A.

First, an exemption of all priests, friars, and monks, in criminal causes, from the cognizance of civil judges. Secondly, collation of benefices on whom he pleased, native or stranger, and exaction of tenths, first fruits, and other payments. Thirdly, appeals to Rome in all causes where the Church could pretend to be concerned. Fourthly, to be the supreme judge concerning lawfulness of marriage, that is concerning the hereditary succession of Kings, and to have the cognizance of all causes concerning adultery and fornication.

B.

Good! A monopoly of women.

A.

Fifthly, a power of absolving subjects of their duties, and of their oaths of fidelity to their lawful sovereigns, when the Pope should think fit for the extirpation of heresy.

B.

This power of absolving subjects of their obedience, as also that other of being judge of manners and doctrine, is as absolute a sovereignty as is possible to be; and consequently there must be two kingdoms in one and the same nation, and no man be able to know which of his masters he must obey.

A.

For my part, I should rather obey that master that had the right of making laws and of inflicting punishments, than him that pretendeth only to a right of making canons, that is to say, rules, and no right of co-action, or otherwise punishing, but by excommunication.

B.

But the Pope pretends also that his canons are laws; and for punishing, can there be greater than excommunication; supposing it true, as the Pope saith it is, that he that dies excommunicate is damned? Which supposition, it seems, you believe not; else you would rather have chosen to obey the Pope, that would cast your body and soul into hell, than the King, that can only kill the body.

A.

You say true. For it were very uncharitable in me to believe that all Englishmen, except a few Papists, that have been born and called heretics ever since the Reformation of Religion in England, should be damned.

B.

But for those that die excommunicate in the Church of England at this day, do you not think them also damned?

A.

Doubtless, he that dies in sin without repentance is damned, and he that is excommunicate for disobedience to the King's laws, either spiritual or temporal, is excommunicate for sin; and therefore, if he die excommunicate and without desire of reconciliation, he dies impenitent. You see what follows. But to die in disobedience to the precepts and doctrines of those men that have no authority or jurisdiction over us, is quite another case, and bringeth no such danger with it.

B.

But what is this heresy, which the Church of Rome so cruelly persecutes, as to depose Kings that do not, when they are bidden, turn all heretics out of their dominions?

A.

Heresy is a word which, when it is used without passion, signifies a private opinion. So the different sects of the old philosophers, Academians, Peripatetics, Epicureans, Stoics, &c., were called heresies. But in the Christian Church, there was in the signification of that word, comprehended a sinful opposition to him, that was chief judge of doctrines in order to the salvation of men's souls; and consequently heresy may be said to bear the same relation to the power spiritual, that rebellion doth to the power temporal, and is suitable to be persecuted by him that will preserve a power spiritual and dominion over men's consciences.

B.

It would be very well, (because we are all of us permitted to read the Holy Scriptures, and bound to make them the rule of our actions, both public and private), that heresy were by some law defined, and the particular opinions set forth, for which a man were to be condemned and punished as a heretic; for else, not only men of mean capacity, but even the wisest and devoutest Christian, may fall into heresy without any will to oppose the Church; for the Scriptures are hard, and the interpretations different of different men.

A.

The meaning of the word heresy, is by law declared in an Act of Parliament in the first year of Queen Elizabeth; wherein it is ordained, that the persons who had by the Queen's letters-patent the authority spiritual, meaning the High Commission, shall not have authority to adjudge any matter or cause to be heresy, but only such as heretofore have been adjudged to be heresy by the authority of the canonical Scriptures, or by the first four general Councils, or by any other general Council, where the same was declared heresy by the express and plain words of the said canonical Scriptures, or such as hereafter shall be adjudged heresy by the high court of Parliament of this realm, with the assent of the clergy in their convocation.

B.

It seems therefore, if there arise any new error that hath not yet been declared heresy, (and many such may arise), it cannot be judged heresy without a Parliament. For how foul soever the error be, it cannot have been declared heresy neither in the Scriptures nor in the Councils;

because it was never before heard of. And consequently there can be no error, unless it fall within the compass of blasphemy against God or treason against the King, for which a man can in equity be punished. Besides, who can tell what is declared by the Scripture, which every man is allowed to read and interpret to himself? Nay more, what Protestant, either of the laity or clergy, if every general Council can be a competent judge of heresy, is not already condemned? For divers Councils have declared a great many of our doctrines to be heresy, and that, as they pretend, upon the authority of the Scriptures.

A.

What are those points, that the first four general Councils have declared heresy?

B.

The first general Council, held at Nicæa, declared all to be heresy which was contrary to the Nicene Creed, upon occasion of the heresy of Arius, which was the denying the divinity of Christ. The second general Council, held at Constantinople, declared heresy the doctrine of Macedonius; which was that the Holy Ghost was created. The third Council, assembled at Ephesus, condemned the doctrine of Nestorius, that there were two persons in Christ. The fourth, held at Chalcedon, condemned the error of Eutyches, that there was but one nature in Christ. I know of no other points condemned in these four Councils, but such as concern church-government, or the same doctrines taught by other men in other words. And these Councils were all called by the Emperors, and by them their decrees confirmed at the petition of the Councils themselves.

A.

I see by this, that both the calling of the Council, and the confirmation of their doctrine and church-government, had no obligatory force but from the authority of the Emperor. How comes it then to pass, that they take upon them now a legislative power, and say their canons are laws? That text, all power is given to me in heaven and earth, had the same force then as it hath now, and conferred a legislative power on the Councils, not only over Christian men, but over all nations in the world.

B.

They say no; for the power they pretend to is derived from this, that when a king was converted from Gentilism to Christianity, he did by that very submission to the bishop that converted him, submit to the bishop's government and became one of his sheep; which right therefore he could not have over any nation that was not Christian.

A.

Did Sylvester, which was Pope of Rome in the time of Constantine the Great, converted by him, tell the Emperor, his new disciple, beforehand, that if he became a Christian he must be the Pope's subject?

B.

I believe not. For it is likely enough, if he had told him so plainly, or but made him suspect it, he would either have been no Christian at all, or but a counterfeit one.

A.

But if he did not tell him so, and that plainly, it was foul play, not only in a priest, but in any Christian. And for this derivation of their right from the Emperor's consent, it proceeds only from this, that they dare not challenge a legislative power, nor call their canons laws in any kingdom in Christendom, further than the kings make them so. But in Peru, when Atabalipa was King, the friar told him, that Christ being King of all the world, had given the disposing of all the kingdoms therein to the Pope, and that the Pope had given Peru to the Roman Emperor Charles the Fifth, and required Atabalipa to resign it; and for refusing it, seized upon his person by the Spanish army there present, and murdered him. You see by this how much they claim, when they have power to make it good.

B.

When began the Popes to take this authority upon them first?

A.

After the inundation of the northern people had overflowed the western parts of the empire, and possessed themselves of Italy, the people of the city of Rome submitted themselves, as well in temporals as spirituals, to their bishop; and then first was the Pope a temporal prince, and stood no more in so great fear of the Emperors, which lived far off at Constantinople. In this time it was that the Pope began, by pretence of his power spiritual, to encroach upon the temporal rights of all other princes of the west; and so continued gaining upon them, till his power was at the highest in that three hundred years, or thereabout, which passed between the eighth and eleventh century, that is, between Pope Leo the Third and Pope Innocent the Third. For in this time Pope Zachary the First deposed Chilperic, then King of France, and gave the

kingdom to one of his subjects, Pepin; and Pepin took from the Lombards a great part of their territory and gave it to the Church. Shortly after, the Lombards having recovered their estate, Charles the Great retook it, and gave it to the Church again; and Pope Leo the Third made Charles Emperor.

B.

But what right did the Pope then pretend for the creating of an Emperor?

A.

He pretended the right of being Christ's vicar; and what Christ could give, his vicar might give; and you know that Christ was King of all the world.

B.

Yes, as God; and so he gives all the kingdoms of the world, which nevertheless proceed from the consent of people, either for fear or hope.

A.

But this gift of the empire was in a more special manner, in such a manner as Moses had the government of Israel given him; or rather as Joshua had it given him, to go in and out before the people as the high-priest should direct him. And so the empire was understood to be given him, on condition to be directed by the Pope. For when the Pope invested him with the regal ornaments, the people all cried out Deus dat, that is to say, it is God that gives it; and the Emperor was contented so to take it. And from that time, all or most of the Christian Kings do put

into their titles the words *Dei gratia*, that is, by the gift of God; and their successors use still to receive the crown and sceptre from a bishop.

B.

It is certainly a very good custom, for Kings to be put in mind by whose gift they reign; but it cannot from that custom be inferred that they receive the kingdom by mediation of the Pope, or by any other clergy; for the Popes themselves received the Papacy from the Emperor. The first that ever was elected Bishop of Rome after Emperors were Christians, and without the Emperor's consent, excused himself by letters to the Emperor with this: that the people and clergy of Rome forced him to take it upon him, and prayed the Emperor to confirm it, which the Emperor did; but with reprehension of their proceedings, and the prohibition of the like for the time to come. The Emperor was Lotharius, and the Pope Calixtus the First.

A.

You see by this the Emperor never acknowledged this gift of God was the gift of the Pope, but maintained, the Popedom was the gift of the Emperor. But in process of time, by the negligence of the Emperors, (for the greatness of Kings makes them that they cannot easily descend into the obscure and narrow mines of an ambitious clergy), they found means to make the people believe, there was a power in the Pope and clergy, which they ought to submit unto, rather than to the commands of their own Kings, whensoever it should come into controversy: and to that end devised and decreed many new articles of faith, to the diminution of the authority of kings, and to the disjunction of them and their subjects, and to a closer adherence of their subjects to the Church

of Rome; articles either not at all found in, or not well founded upon the Scriptures; as first; that it should not be lawful for a priest to marry.

B.

What influence could that have upon the power of Kings?

A.

Do you not see, that by this the King must of necessity either want the priesthood, and therewith a great part of the reverence due to him from the most religious part of his subjects, or else want lawful heirs to succeed him: by which means, being not taken for the head of the Church, he was sure, in any controversy between him and the Pope, that his subjects would be against him?

B.

Is not a Christian King as much a bishop now, as the heathen Kings were of old? for among them episcopus was a name common to all Kings. Is not he a bishop now, to whom God hath committed the charge of all the souls of his subjects, both of the laity and the clergy? And though he be in relation to our Saviour, who is the chief pastor, but a sheep, yet, compared to his own subjects, they are all sheep, both laic and cleric, and he only shepherd. And seeing a Christian bishop is but a Christian endued with power to govern the clergy, it follows that every Christian king is not only a bishop, but an arch-bishop, and his whole dominion his diocese. And though it were granted, that imposition of hands is necessary from a priest; yet seeing Kings have the government of the clergy, that are his subjects even before baptism; the baptism itself, wherein he is received as a Christian, is a sufficient imposition of

hands, so that whereas before he was a bishop, now he is a Christian bishop.

A.

For my part I agree with you: this prohibition of marriage to priests came in about the time of Pope Gregory the Seventh, and William the First, King of England; by which means the Pope had in England, what with secular and what with regular priests, a great many lusty bachelors at his service.

Secondly, that auricular confession to a priest was necessary to salvation. It is true, that before that time, confession to a priest was usual, and performed for the most part by him that confessed, in writing. But that use was taken away about the time of King Edward III, and priests commanded to take confessions from the mouth of the confitent: and men did generally believe, that without confession and absolution before their departure out of the world, they could not be saved; and having absolution from a priest, that they could not be damned. You understand by this, how much every man would stand in awe of the Pope and clergy, more than they would of the King; and what inconvenience it is to a state for their subjects to confess their secret thoughts to spies.

B.

Yes, as much as eternal torture is more terrible than death, so much they would fear the clergy more than the King.

A.

And though perhaps the Roman clergy will not maintain, that a priest hath power to remit sins absolutely, but only with a condition of repentance, yet the people were never so instructed by them; but were left to believe, that whensoever they had absolution, their precedent sins were all discharged, when their penance, which they took for repentance, was performed. Within the same time began the article of transubstantiation. For it had been disputed a long time before, in what manner a man did eat the body of our Saviour Jesus Christ, as being a point very difficult for a man to conceive and imagine clearly; but now it was made very clear, that the bread was transubstantiated into Christ's body, and so was become no more bread, but flesh.

B.

It seems then that Christ had many bodies, and was in as many places at once, as there were communicants. I think the priests then were so wanton, as to insult upon the dulness, not only of common people, but also of kings and their councillors.

A.

I am now in a narration, not in a disputation; and therefore I would have you at this time to consider nothing else, but what effect this doctrine would work upon kings and their subjects, in relation to the clergy, who only were able of a piece of bread to make our Saviour's body, and thereby at the hour of death to save their souls.

B.

For my part, it would have an effect on me, to make me think them gods, and to stand in awe of them as of God himself, if he were visibly

present.

A.

Besides these, and other articles tending to the upholding of the Pope's authority, they had many fine points in their ecclesiastical polity, conducing to the same end; of which I will mention only such as were established within the same time. For then it was the order came up of preaching friars, that wandered up and down, with power to preach in what congregation they pleased, and were sure enough to instil into the people nothing that might lessen the obedience to the Church of Rome; but, on the contrary, whatsoever might give advantage to it against the civil power. Besides, they privately insinuated themselves with women and men of weak judgment, confirming their adherence to the Pope, and urging them, in the time of their sickness, to be beneficial to it by contribution of money, or building religious houses, or pious works and necessary for the remission of their sins.

B.

I do not remember that I have read of any kingdom or state in the world, where liberty was given to any private man to call the people together, and make orations frequently to them, or at all, without first making the state acquainted, except only in Christendom. I believe the heathen Kings foresaw, that a few such orators would be able to make a great sedition. Moses did indeed command to read the Scriptures and expound them in the Synagogues every Sabbath-day. But the Scriptures then were nothing else but the laws of the nation, delivered unto them by Moses himself. And I believe it would do no hurt, if the laws of England also were often read and expounded in the several

congregations of Englishmen, at times appointed, that they may know what to do; for they know already what to believe.

A.

I think that neither the preaching of friars nor monks, nor of parochial priests, tended to teach men what, but whom to believe. For the power of the mighty hath no foundation but in the opinion and belief of the people. And the end which the Pope had in multiplying sermons, was no other but to prop and enlarge his own authority over all Christian Kings and States.

Within the same time, that is, between the time of the Emperor Charles the Great and of King Edward the Third of England, began their second polity; which was, to bring religion into an art, and thereby to maintain all the decrees of the Roman Church by disputation; not only from the Scriptures, but also from the philosophy of Aristotle, both moral and natural. And to that end the Pope exhorted the said Emperor by letter, to erect schools of all kinds of literature; and from thence began the institution of universities; for not long after, the universities began in Paris and in Oxford. It is true, that there were schools in England before that time, in several places, for the instruction of children in the Latin tongue, that is to say, in the tongue of the Church. But for an university of learning, there was none erected till that time; though it be not unlikely there might be then some that taught philosophy, logic, and other arts, in divers monasteries, the monks having little else to do but to study. After some colleges were built to that purpose, it was not long time before many more were added to them, by the devotion of princes and bishops, and other wealthy men: and the discipline therein was confirmed by the Popes that then were; and abundance of scholars sent thither by their friends to study, as to a place from whence the way was

open and easy to preferment both in Church and Commonwealth. The profit the Church of Rome expected from them, and in effect received, was the maintenance of the Pope's doctrine, and of his authority over kings and their subjects, by school-divines; who striving to make good many points of faith incomprehensible, and calling in the philosophy of Aristotle to their assistance, wrote great books of school-divinity, which no man else, nor they themselves, were able to understand; as any man may perceive that shall consider the writings of Peter Lombard, or Scotus, or of him that wrote commentaries upon him, or of Suarez, or any other school-divine of later times. Which kind of learning nevertheless hath been much admired by two sorts of men, otherwise prudent enough. The one of which sorts were of those that were already devoted and really affectionate to the Roman Church; for they believed the doctrine before, but admired the arguments because they understood them not, and yet found the conclusions to their mind. The other sort were negligent men, that had rather admire with others, than take the pains to examine. So that all sorts of people were fully resolved, that both the doctrine was true, and the Pope's authority no more than what was due to him.

B.

I see that a Christian king, or state, how well soever provided he be of money and arms, where the Church of Rome hath such authority, will have but a hard match of it, for want of men. For their subjects will hardly be drawn into the field and fight with courage against their consciences.

A.

It is true that great rebellions have been raised by Church-men in the Pope's quarrel against kings, as in England against King John, and in France against King Henry IV. Wherein the Kings had a more considerable part on their sides, than the Pope had on his; and shall always have so, if they have money. For there are but few whose consciences are so tender as to refuse money when they want it. But the great mischief done to kings upon pretence of religion is, when the Pope gives power to one king to invade another.

B.

I wonder how King Henry the Eighth could then so utterly extinguish the authority of the Pope in England, and that without any rebellion at home, or any invasion from abroad.

A.

First, the priests, monks, and friars, being in the height of their power, were now for the most part grown insolent and licentious; and thereby the force of their arguments was now taken away by the scandal of their lives, which the gentry and men of good education easily perceived: and the Parliament consisting of such persons, were therefore willing to take away their power: and generally the common people, which from a long custom had been in love with Parliaments, were not displeased therewith. Secondly, the doctrine of Luther beginning a little before, was now by a great many men of the greatest judgment so well received, as that there was no hope to restore the Pope to his power by rebellion. Thirdly, the revenue of abbeys and all other religious houses, falling thereby into the King's hands, and by him being disposed of to the most eminent gentlemen in every county, could not but make them do their best to confirm themselves in the possession of them. Fourthly,

King Henry was of a nature quick and severe in the punishing of such as should be the first to oppose his designs. Lastly, as to invasion from abroad, in case the Pope had given the kingdom to another prince, it had been in vain; for England is another manner of kingdom than Navarre. Besides, the French and Spanish forces were employed at that time one against another: and though they had been at leisure, they would have found perhaps no better success than the Spaniards found afterwards in 1588. Nevertheless, notwithstanding the insolence, avarice, and hypocrisy of the then clergy, and notwithstanding the doctrine of Luther, if the Pope had not provoked the King by endeavouring to cross his marriage with his second wife, his authority might have remained in England till there had risen some other quarrel.

B.

Did not the bishops, that then were, and had taken an oath, wherein was, amongst other things, that they should defend and maintain the legal rights of St. Peter: (the words are, Regalia Sancti Petri, which nevertheless some have said are regulas Sancti Petri, that is to say, St. Peter's rules or doctrine; and that the clergy afterward did read it, being perhaps written in short-hand, by a mistake to the Pope's advantage regalia): did not, I say, the bishops oppose that Act of Parliament against the Pope, and against the taking of the oath of supremacy?

A.

No, I do not find that the bishops did many of them oppose the King; for having no power without him, it had been great imprudence to provoke his anger. There was besides a controversy in those times between the Pope and the bishops, most of which did maintain that they exercised their jurisdiction episcopal in the right of God, as immediately as the

Pope himself did exercise the same over the whole Church. And because they saw that by this Act of the King in Parliament they were to hold their power no more of the Pope, and never thought of holding it of the King, they were perhaps better content to let that Act of Parliament pass. In the reign of King Edward VI the doctrine of Luther had taken so great root in England, that they threw out also a great many of the Pope's new articles of faith; which Queen Mary succeeding him restored again, together with all that had been abolished by Henry VIII, saving that which could not be restored, the religious houses; and the bishops and clergy of King Edward were partly burnt for heretics, partly fled, and partly recanted. And they that fled betook themselves to those places beyond sea, where the reformed religion was either protected or not persecuted; who, after the decease of Queen Mary, returned again to favour and preferment under Queen Elizabeth, that restored the religion of her brother King Edward. And so it hath continued till this day, excepting the interruption made in this late rebellion of the presbyterians and other democratical men. But though the Romish religion were now cast out by the law, yet there were abundance of people, and many of them of the nobility, that still retained the religion of their ancestors, who as they were not much molested in points of conscience, so they were not by their own inclination very troublesome to the civil government; but by the secret practice of the Jesuits and other emissaries of the Roman Church, they were made less quiet than they ought to have been; and some of them to venture on the most horrid act that ever had been heard of before, I mean the Gunpowder Treason. And upon that account, the Papists of England have been looked upon as men that would not be sorry for any disorders here that might possibly make way to the restoring of the Pope's authority. And

therefore I named them for one of the distempers of the state of England in the time of our late King Charles.

B.

I see that Monsieur Mornay du Plessis, and Dr. Morton, Bishop of Durham, writing of the progress of the Pope's power, and intitling their books, one of them, The Mystery of Iniquity, the other, The Grand Imposture, were both in the right. For I believe there was never such another cheat in the world, and I wonder that the Kings and States of Christendom never perceived it.

A.

It is manifest they did perceive it. How else durst they make war against the Pope, and some of them take him out of Rome itself and carry him away prisoner? But if they would have freed themselves from his tyranny, they should have agreed together, and made themselves every one, as Henry VIII did, head of the Church within their own respective dominions. But not agreeing, they let his power continue, every one hoping to make use of it, when there should be cause, against his neighbour.

B.

Now, as to that other distemper by Presbyterians, how came their power to be so great, being of themselves, for the most part, but so many poor scholars?

A.

This controversy between the Papist and the Reformed Churches, could not choose but make every man, to the best of his power, examine by the Scriptures, which of them was in the right; and to that end they were translated into vulgar tongues; whereas before, the translation of them was not allowed, nor any man to read them but such as had express license so to do. For the Pope did concerning the Scriptures the same that Moses did concerning Mount Sinai. Moses suffered no man to go up to it to hear God speak or gaze upon him, but such as he himself took with him; and the Pope suffered none to speak with God in the Scriptures, that had not some part of the Pope's spirit in him, for which he might be trusted.

B.

Certainly Moses did therein very wisely, and according to God's own commandment.

A.

No doubt of it, and the event itself hath made it appear so. For after the Bible was translated into English, every man, nay, every boy and wench, that could read English, thought they spoke with God Almighty, and understood what he said, when by a certain number of chapters a day they had read the Scriptures once or twice over. The reverence and obedience due to the Reformed Church here, and to the bishops and pastors therein, was cast off, and every man became a judge of religion, and an interpreter of the Scriptures to himself.

B.

Did not the Church of England intend it should be so? What other end could they have in recommending the Bible to me, if they did not mean I should make it the rule of my actions? Else they might have kept it, though open to themselves, to me sealed up in Hebrew, Greek, and Latin, and fed me out of it in such measure as had been requisite for the salvation of my soul and the Church's peace.

A.

I confess this licence of interpreting the Scripture was the cause of so many several sects, as have lain hid till the beginning of the late King's reign, and did then appear to the disturbance of the commonwealth. But to return to the story. Those persons that fled for religion in the time of Queen Mary, resided, for the most part, in places where the Reformed religion was professed and governed by an assembly of ministers; who also were not a little made use of, for want of better statesmen, in points of civil government. Which pleased so much the English and Scotch Protestants that lived amongst them, that at their return they wished there were the same honour and reverence given to the ministry in their own countries. In Scotland, King James being then young, soon with the help of some of the powerful nobility they brought it to pass. Also they that returned into England in the beginning of the reign of Queen Elizabeth, endeavoured the same here, but could never effect it till this last rebellion, nor without the aid of the Scots. And it was no sooner effected, but they were defeated again by the other sects, which, by the preaching of the Presbyterians and private interpretation of Scripture, were grown numerous.

B.

I know indeed that in the beginning of the late war, the power of the Presbyterians was so very great, that, not only the citizens of London were almost all of them at their devotion, but also the greatest part of all other cities and markettowns of England. But you have not yet told me by what art and what degrees they became so strong.

A.

It was not their own art alone that did it, but they had the concurrence of a great many gentlemen, that did no less desire a popular government in the civil state than these ministers did in the Church. And as these did in the pulpit draw the people to their opinions, and to a dislike of the Church-government, Canons, and Common-prayerbook, so did the other make them in love with democracy by their harangues in the Parliament, and by their discourses and communication with people in the country, continually extolling liberty and inveighing against tyranny, leaving the people to collect of themselves that this tyranny was the present government of the state. And as the Presbyterians brought with them into their churches their divinity from the universities, so did many of the gentlemen bring their politics from thence into the Parliament; but neither of them did this very boldly in the time of Queen Elizabeth. And though it be not likely that all of them did it out of malice, but many of them out of error, yet certainly the chief leaders were ambitious ministers and ambitious gentlemen; the ministers envying the authority of bishops, whom they thought less learned; and the gentlemen envying the privy-council, whom they thought less wise than themselves. For it is a hard matter for men, who do all think highly of their own wits, when they have also acquired the learning of the university, to be persuaded that they want any ability requisite for the government of a commonwealth, especially having read the glorious histories and the

sententious politics of the ancient popular governments of the Greeks and Romans, amongst whom kings were hated and branded with the name of tyrants, and popular government (though no tyrant was ever so cruel as a popular assembly) passed by the name of liberty. The Presbyterian ministers, in the beginning of the reign of Queen Elizabeth, did not, because they durst not, publicly preach against the discipline of the Church. But not long after, by the favour perhaps of some great courtier, they went abroad preaching in most of the market-towns of England, as the preaching friars had formerly done, upon working-days in the morning; in which sermons, these and others of the same tenets, that had charge of souls, both by the manner and matter of their preaching, applied themselves wholly to the winning of the people to a liking of their doctrines and good opinion of their persons.

And first, for the manner of their preaching; they so framed their countenance and gesture at their entrance into the pulpit, and their pronounciation both in their prayer and sermon, and used the Scripture phrase (whether understood by the people or not), as that no tragedian in the world could have acted the part of a right godly man better than these did; insomuch that a man unacquainted with such art, could never suspect any ambitious plot in them to raise sedition against the state, as they then had designed; or doubt that the vehemence of their voice (for the same words with the usual pronounciation had been of little force) and forcedness of their gesture and looks, could arise from anything else but zeal to the service of God. And by this art they came into such credit, that numbers of men used to go forth of their own parishes and towns on working-days, leaving their calling, and on Sundays leaving their own churches, to hear them preach in other places, and to despise their own and all other preachers that acted not so well as they. And as for those ministers that did not usually preach, but instead of sermons

did read to the people such homilies as the Church had appointed, they esteemed and called them dumb dogs.

Secondly, for the matter of their sermons, because the anger of the people in the late Roman usurpation was then fresh, they saw there could be nothing more gracious with them than to preach against such other points of the Romish religion as the bishops had not yet condemned; that so receding further from popery than they did, they might with glory to themselves leave a suspicion on the bishops, as men not yet well purged from idolatry.

Thirdly, before their sermons, their prayer was or seemed to be extempore, which they pretended to be dictated by the spirit of God within them, and many of the people believed or seemed to believe it. For any man might see, that had judgment, that they did not take care beforehand what they should say in their prayers. And from hence came a dislike of the common-prayer-book, which is a set form, premeditated, that men might see to what they were to say amen.

Fourthly, they did never in their sermons, or but lightly, inveigh against the lucrative vices of men of trade or handicraft; such as are feigning, lying, cozening, hypocrisy, or other uncharitableness, except want of charity to their pastors and to the faithful: which was a great ease to the generality of citizens and the inhabitants of market-towns, and no little profit to themselves.

Fifthly, by preaching up an opinion that men were to be assured of their salvation by the testimony of their own private spirit, meaning the Holy Ghost dwelling within them. And from this opinion the people that found in themselves a sufficient hatred towards the Papists, and an ability to repeat the sermons of these men at their coming home, made no doubt but that they had all that was necessary, how fraudulently and

spitefully soever they behaved themselves to their neighbours that were not reckoned amongst the saints, and sometimes to those also.

Sixthly, they did, indeed, with great earnestness and severity, inveigh often against two sins, carnal lusts and vain swearing; which, without question, was very well done. But the common people were thereby inclined to believe, that nothing else was sin, but that which was forbidden in the third and seventh commandments (for few men do understand by the name of lust any other concupiscence, than that which is forbidden in that seventh commandment; for men are not ordinarily said to lust after another man's cattle, or other goods or possessions): and therefore never made much scruple of the acts of fraud and malice, but endeavoured to keep themselves from uncleanness only, or at least from the scandal of it. And, whereas they did, both in their sermons and writings, maintain and inculcate, that the very first motions of the mind, that is to say, the delight men and women took in the sight of one another's form, though they checked the proceeding thereof so that it never grew up to be a design, was nevertheless a sin, they brought young men into desperation and to think themselves damned, because they could not (which no man can, and is contrary to the constitution of nature) behold a delightful object without delight. And by this means they became confessors to such as were thus troubled in conscience, and were obeyed by them as their spiritual doctors in all cases of conscience.

B.

Yet divers of them did preach frequently against oppression.

A.

It is true, I had forgot that; but it was before such as were free enough from it; I mean the common people, who would easily believe themselves oppressed, but never oppressors. And therefore you may reckon this among their artifices, to make the people believe they were oppressed by the King, or perhaps by the bishops, or both; and incline the meaner sort to their party afterwards, when there should be occasion. But this was but sparingly done in the time of Queen Elizabeth, whose fear and jealousy they were afraid of. Nor had they as yet any great power in the Parliament-house, whereby to call in question her prerogative by petitions of right and other devices, as they did afterwards, when democratical gentlemen had received them into their counsels for the design of changing the government from monarchical to popular, which they called liberty.

B.

Who would think that such horrible designs as these could so easily and so long remain covered with the cloak of godliness? For that they were most impious hypocrites, is manifest enough by the war these proceedings ended in, and by the impious acts in that war committed. But when began first to appear in Parliament the attempt of popular government, and by whom?

A.

As to the time of attempting the change of government from monarchical to democratical, we must distinguish. They did not challenge the sovereignty in plain terms, and by that name, till they had slain the King; nor the rights thereof altogether by particular heads, till the King was driven from London by tumults raised in that city against him, and retired for the security of his person to York; where he had not

been many days, when they sent unto him nineteen propositions, whereof above a dozen were demands of several powers, essential parts of the power sovereign. But before that time they had demanded some of them in a petition which they called a Petition of Right; which nevertheless the King had granted them in a former Parliament, though he deprived himself thereby, not only of the power to levy money without their consent, but also of his ordinary revenue by custom of tonnage and poundage, and of the liberty to put into custody such men as he thought likely to disturb the peace and raise sedition in the kingdom. As for the men that did this, it is enough to say they were members of the last Parliament, and of some other Parliaments in the beginning of King Charles and the end of King James his reign; to name them all is not necessary, further than the story shall require. Most of them were members of the House of Commons; some few also, of the Lords; but all, such as had a great opinion of their sufficiency in politics, which they thought was not sufficiently taken notice of by the King.

B.

How could the Parliament, when the King had a great navy, and a great number of trained soldiers, and all the magazines of ammunition in his power, be able to begin the war?

A.

The King had these things indeed in his right; but that signifies little, when they that had the custody of the navy and magazines, and with them all the trained soldiers, and in a manner all his subjects, were, by the preaching of Presbyterian ministers, and the seditious whisperings of false and ignorant politicians, made his enemies; and when the King could have no money but what the Parliament should give him, which

you may be sure should not be enough to maintain his regal power, which they intended to take from him. And yet, I think, they never would have ventured into the field, but for that unlucky business of imposing upon the Scots, who were all Presbyterians, our book of Common-prayer. For I believe the English would never have taken well that the Parliament should make war upon the King, upon any provocation, unless it were in their own defence, in case the King should first make war upon them; and, therefore, it behoved them to provoke the King, that he might do something that might look like hostility. It happened in the year 1637, that the King, by the advice, as it is thought, of the Archbishop of Canterbury, sent down a book of Common-prayer into Scotland, not differing in substance from ours, nor much in words besides the putting of the word Presbyter for that of Minister, commanding it to be used, for conformity to this kingdom, by the ministers there, for an ordinary form of Divine service. This being read in the church at Edinburgh, caused such a tumult there, that he that read it had much ado to escape with his life; and gave occasion to the greatest part of the nobility and others to enter, by their own authority, into a covenant amongst themselves, which impudently they called a covenant with God, to put down episcopacy, without consulting with the King: which they presently did, animated thereto by their own confidence, or by assurance from some of the democratical Englishmen that in former Parliaments had been the greatest opposers of the King's interest, that the King would not be able to raise an army to chastise them without calling a Parliament, which would be sure to favour them. For the thing which those democraticals chiefly then aimed at, was to force the King to call a Parliament, which he had not done for ten years before, as having found no help, but hindrance to his designs in the Parliaments he had formerly called. Howsoever, contrary to their

expectation, by the help of his better-affected subjects of the nobility and gentry, he made a shift to raise a sufficient army to have reduced the Scots to their former obedience, if it had proceeded to battle. And with this army he marched himself into Scotland; where the Scotch army was also brought into the field against him, as if they meant to fight. But then the Scotch sent to the King for leave to treat by commissioners on both sides; and the King, willing to avoid the destruction of his own subjects, condescended to it. The issue was peace; and the King thereupon went to Edinburgh, and passed an Act of Parliament there to their satisfaction.

B.

Did he not then confirm episcopacy?

A.

No, but yielded to the abolishing of it: but by this means the English were crossed in their hope of a Parliament. But the said democratics, formerly opposers of the King's interest, ceased not to endeavour still to put the two nations into a war; to the end the King might buy the Parliament's help at no less a price than sovereignty itself.

B.

But what was the cause that the gentry and nobility of Scotland were so averse from the episcopacy? For I can hardly believe that their consciences were extraordinarily tender, nor that they were so very great divines, as to know what was the true Church-discipline established by our Saviour and his apostles; nor yet so much in love with their ministers, as to be over-ruled by them in the government either

ecclesiastical or civil. For in their lives they were just as other men are, pursuers of their own interests and preferments, wherein they were not more opposed by the bishops than by their Presbyterian ministers.

A.

Truly I do not know; I cannot enter into other men's thoughts, farther than I am led by the consideration of human nature in general. But upon this consideration I see first, that men of ancient wealth and nobility are not apt to brook, that poor scholars should (as they must, when they are made bishops) be their fellows. Secondly, that from the emulation of glory between the nations, they might be willing to see this nation afflicted by civil war, and might hope, by aiding the rebels here, to acquire some power over the English, at least so far as to establish here the Presbyterian discipline; which was also one of the points they afterwards openly demanded. Lastly, they might hope for, in the war, some great sum of money, as a reward of their assistance, besides great booty, which they afterwards obtained. But whatsoever was the cause of their hatred to bishops, the pulling of them down was not all they aimed at: if it had, now that episcopacy was abolished by act of Parliament, they would have rested satisfied, which they did not. For after the King was returned to London, the English Presbyterians and democratics, by whose favour they had put down bishops in Scotland, thought it reason to have the assistance of the Scotch for the pulling down of bishops in England. And in order thereunto, they might perhaps deal with the Scots secretly, to rest unsatisfied with that pacification, which they were before contented with. Howsoever it was, not long after the King was returned to London, they sent up to some of their friends at court a certain paper, containing, as they pretended, the articles of the said pacification; a false and scandalous paper, which was by the King's

command burnt, as I have heard, publicly. And so both parties returned to the same condition they were in, when the King went down with his army.

B.

And so there was a great deal of money cast away to no purpose. But you have not told me who was general of that army.

A.

I told you the King was there in person. He that commanded under him was the Earl of Arundel, a man that wanted not either valour or judgment. But to proceed to battle or to treaty, was not in his power, but in the King's.

B.

He was a man of a most noble and loyal family, and whose ancestors had formerly given a great overthrow to the Scots, in their own country; and in all likelihood he might have given them the like now, if they had fought.

A.

He might indeed: but it had been but a kind of superstition to have made him general upon that account, though many generals heretofore have been chosen for the good luck of their ancestors in like occasions. In the long war between Athens and Sparta, a general of the Athenians by sea won many victories against the Spartans; for which cause, after his death, they chose his son for general with ill success. The Romans that conquered Carthage by the valour and conduct of Scipio, when they

were to make war again in Afric against Cæsar, chose another Scipio for general; a man valiant and wise enough, but he perished in the employment. And to come home to our own nation, the Earl of Essex made a fortunate expedition to Cadiz; but his son, sent afterwards to the same place, could do nothing. It is but a foolish superstition, to hope that God has entailed success in war upon a name or family.

B.

After the pacification broken, what succeeded next?

A.

The King sent Duke Hamilton with commission and instructions into Scotland, to call a Parliament there, and to use all the means he could otherwise; but all was to no purpose. For the Scots were now resolved to raise an army and to enter into England, to deliver, as they pretended, their grievances to his majesty in a petition; because the King, they said, being in the hands of evil counsellors, they could not otherwise obtain their right. But the truth is, they were animated to it by the democratical and Presbyterian English, with a promise of reward and hope of plunder. Some have said, that Duke Hamilton also did rather encourage them to, than deter them from, the expedition; as hoping by the disorder of the two kingdoms, to bring to pass that which he had formerly been accused to endeavour, to make himself King of Scotland. But I take this to have been a very uncharitable censure, upon so little ground to judge so hardly of a man, that afterwards lost his life in seeking to procure the liberty of the King his master. This resolution of the Scots to enter England being known, the King wanting money to raise an army against them, was now, as his enemies here wished, constrained to call a parliament, to meet at Westminster the 13th day of April 1640.

B.

Methinks a Parliament of England, if upon any occasion, should furnish the King with money now in war against the Scots, out of an inveterate disaffection to that nation that had always anciently taken part with their enemies the French, and which always esteemed the glory of England for an abatement of their own.

A.

It is indeed commonly seen that neighbour nations envy one another's honour, and that the less potent bears the greater malice; but that hinders them not from agreeing in those things which their common ambition leads them to. And therefore the King found not the more, but the less help from this Parliament: and most of the members thereof, in their ordinary discourses, seemed to wonder why the King should make a war upon Scotland; and in that Parliament sometimes called them their brethren the Scots. But instead of taking the King's business, which was the raising of money, into their consideration, they fell upon the redressing of grievances, and especially such ways of levying money as in the late intermission of Parliaments the King had been forced to use; such as were ship-money, for knighthood, and such other vails (as one may call them) of the regal office, which lawyers had found justifiable by the ancient records of the kingdom. Besides, they fell upon the actions of divers ministers of state, though done by the King's own command and warrant. Insomuch, that before they were to come to the business for which they were called, the money which was necessary for this war (if they had given any, as they never meant to do) had come too late. It is true, there was mention of a sum of money to be given the King, by way of bargain, for the relinquishing of his right to ship-

money, and some other of his prerogatives, but so seldom, and without determining any sum, that it was in vain for the King to hope for any success; and therefore upon the 5th of May following he dissolved it.

B.

Where then had the King money to raise and pay his army?

A.

He was forced the second time to make use of the nobility and gentry, who contributed some more, some less, according to the greatness of their estates; but amongst them all they made up a very sufficient army.

B.

It seems then that the same men, that crossed his business in the Parliament, now out of Parliament advanced it all they could. What was the reason of that?

A.

The greatest part of the Lords in Parliament, and of the gentry throughout England, were more affected to monarchy than to a popular government, but so as not to endure to hear of the King's absolute power; which made them in time of Parliament easily to condescend to abridge it, and bring the government to a mixed monarchy, as they called it; wherein the absolute sovereignty should be divided between the King, the House of Lords, and the House of Commons.

B.

But how, if they cannot agree?

A.

I think they never thought of that; but I am sure they never meant the sovereignty should be wholly either in one or both houses. Besides, they were loath to desert the King, when he was invaded by foreigners; for the Scotch were esteemed by them as a foreign nation.

B.

It is strange to me, that England and Scotland being but one island, and their language almost the same, and being governed by one King, should be thought foreigners to one another. The Romans were masters of many nations, and to oblige them the more to obey the edicts and laws sent unto them from the city of Rome, they thought fit to make them all Romans; and out of divers nations, as Spain, Germany, Italy, and France, to advance some, that they thought worthy, even to be senators of Rome, and to give every one of the common people the privileges of the city of Rome, by which they were protected from the contumelies of other nations where they resided. Why were not the Scotch and English in like manner united into one people?

A.

King James at his first coming to the crown of England did endeavour it, but could not prevail. But for all that, I believe the Scotch have now as many privileges in England as any nation had in Rome, of those which were so as you say made Romans. For they are all naturalized, and have right to buy land in England to themselves and their heirs.

B.

It is true of them, that were born in Scotland after the time that King James was in possession of the kingdom of England.

A.

There be very few now that were born before. But why have they a better right that were born after, than they that were born before?

B.

Because they were born subjects to the King of England, and the rest not.

A.

Were not the rest born subjects to King James? And was not the King of England?

B.

Yes, but not then.

A.

I understand not the subtilty of that distinction. But upon what law is that distinction grounded? Is there any statute to that purpose?

B.

I cannot tell; I think not; but it is grounded upon equity.

A.

I see little equity in this; that those nations that are bound to equal obedience to the same King, should not have equal privileges. And now seeing there be so very few born before King James's coming in, what greater privilege had those ingrafted Romans by their naturalization in the state of Rome, or in the state of England the English themselves, more than the Scotch?

B.

Those Romans, when any of them were in Rome, had their voice in the making of laws.

A.

And the Scotch have their Parliaments, wherein their assent is required to the laws there made, which is as good. Have not many of the provinces of France their several parliaments and several constitutions? And yet they are all equally natural subjects of the King of France. And therefore for my part I think they were mistaken, both English and Scotch, in calling one another foreigners. Howsoever that be, the King had a very sufficient army, wherewith he marched towards Scotland; and by the time he was come to York, the Scotch army was drawn up to the frontiers and ready to march into England; which also they presently did; giving out all the way, that their march should be without damage to the country, and that their errand was only to deliver a petition to the King, for the redress of many pretended injuries they had received from such of the court, whose counsel the King most followed. So they passed through Northumberland quietly, till they came to a ford in the river of Tyne, a little above Newcastle, where they found some little opposition from a party of the King's army sent thither to stop them, whom the Scotch easily mastered; and as soon as they were over, seized

upon Newcastle, and coming further on, upon the city of Durham; and sent to the King to desire a treaty, which was granted; and the commissioners on both sides met at Ripon. The conclusion was, that all should be referred to the Parliament, which the King should call to meet at Westminster on the 3rd of November following, being in the same year 1640; and thereupon the King returned to London.

B.

So the armies were disbanded?

A.

No; the Scotch army was to be defrayed by the counties of Northumberland and Durham, and the King was to pay his own, till the disbanding of both should be agreed upon in Parliament.

B.

So in effect both the armies were maintained at the King's charge, and the whole controversy to be decided by a Parliament almost wholly Presbyterian, and as partial to the Scotch as themselves could have wished.

A.

And yet for all this they durst not presently make war upon the King: there was so much yet left of reverence to him in the hearts of the people, as to have made them odious, if they had declared what they intended. They must have some colour or other to make it believed that the King made war first upon the Parliament. And besides, they had not yet sufficiently disgraced him in sermons and pamphlets, nor removed

from about him those they thought could best counsel him. Therefore they resolved to proceed with him like skilful hunters; first to single him out, by men disposed in all parts to drive him into the open field; and then in case he should but seem to turn head, to call that a making of war against the Parliament.

And first they called in question such as had either preached or written in defence of any of those rights, which, belonging to the Crown, they meant to usurp, and take from the King to themselves: whereupon some few preachers and writers were imprisoned, or forced to fly. The King not protecting these, they proceeded to call in question some of the King's own actions in his ministers, whereof they imprisoned some, and some went beyond sea. And whereas certain persons, having endeavoured by books and sermons to raise sedition, and committed other crimes of high nature, had therefore been censured by the King's council in the Star-chamber, and imprisoned; the Parliament by their own authority, to try, it seems, how the King and the people would take it, (for their persons were inconsiderable), ordered their setting at liberty; which was accordingly done, with great applause of the people, that flocked about them in London, in manner of a triumph. This being done without resistance, the King's right to ship-money —

B.

Ship-money! what's that?

A.

The Kings of England, for the defence of the sea, had power to tax all the counties of England, whether they were maritime or not, for the building and furnishing of ships; which tax the King had then lately found cause to impose, and the Parliament exclaimed against it as an

oppression. And by one of their members that had been taxed but 20s. (mark the oppression; a Parliament-man of 500l. a year, land-taxed at 20s.!) they were forced to bring it to a trial at law, he refusing payment; and he was cast. Again, when all the judges of Westminster were demanded their opinions concerning the legality of it, of twelve that there are, it was judged legal by ten; for which though they were not punished, yet they were affrighted by the Parliament.

B.

What did the Parliament mean, when they did exclaim against it as illegal? Did they mean it was against statute-law, or against the judgments of lawyers given heretofore, which are commonly called reports; or did they mean it was against equity, which I take to be the same with the law of nature?

A.

It is a hard matter, or rather impossible, to know what other men mean, especially if they be crafty: but sure I am, equity was not their ground for this pretence of immunity from contributing to the King but at their own pleasure. For when they have laid the burthen of defending the whole kingdom, and governing it, upon any person whatsoever, there is very little equity he should depend on others for the means of performing it; or if he do, they are his Sovereign, not he theirs. And as for the common law contained in reports, they have no force but what the King gives them. Besides, it were more unreasonable, that a corrupt or foolish judge's unjust sentence should by any time, how long soever, obtain the authority and force of a law. But amongst the statute laws there is one, called Magna Charta, or the Great Charter of the liberties of Englishmen, in which there is one article, wherein a King heretofore

hath granted that no man shall be distrained, that is, have his goods taken from him, otherwise than by the law of the land.

B.

Is not that a sufficient ground for their purpose?

A.

No: that leaves us in the same doubt, which you think it clears. For where was that law of the land then? Did they mean another Magna Charta, that was made by some King more ancient yet? No: that statute was made, not to exempt any man from payments to the public, but for securing every man from such as abused the King's power by surreptitiously obtaining the King's warrants, to the oppressing of those against whom he had any suit in law. But it was conducing to the ends of some rebellious spirits in this Parliament, to have it interpreted in the wrong sense, and suitable enough to the understanding of the rest, or most part of them, to let it pass.

B.

You make the members of that Parliament very simple men; and yet the people chose them for the wisest of the land.

A.

If craft be wisdom, they were wise enough. But wise, as I define it, is he that knows how to bring his business to pass, without the assistance of knavery and ignoble shifts, by the sole strength of his good contrivance. A fool may win from a better gamester by the advantage of false dice, and packing of cards.

B.

According to your definition, there be few wise men now-a-days. Such wisdom is a kind of gallantry, that few are brought up to, and most think folly. Fine cloaths, great feathers, civility towards men that will not swallow injuries, and injury towards them that will, is the present gallantry. But when the Parliament afterwards, having gotten the power into their hands, levied money for their own use; what said the people to that?

A.

What else, but that it was legal and to be paid, as being imposed by consent of Parliaments.

B.

I have heard often that they ought to pay what was imposed by consent of Parliaments to the use of the King, but to their own use never before. I see by this, it is easier to gull the multitude, than any one man amongst them. For what one man, that has not his natural judgment depraved by accident, could be so easily cozened in a matter that concerns his purse, had he not been passionately carried away by the rest to change of government, or rather to a liberty of every one to govern himself?

A.

Judge then, what kind of men such a multitude of ignorant people were like to elect for their burgesses and knights of shires.

B.

I can make no other judgment, but that they who were then elected, were just such as had been elected for former Parliaments, and as are like to be elected for Parliaments to come. For the common people have been, and always will be, ignorant of their duty to the public, as never meditating any thing but their particular interest; in other things following their immediate leaders; which are either the preachers, or the most potent of the gentlemen that dwell amongst them: as common soldiers for the most part follow their immediate captains, if they like them. If you think the late miseries have made them wiser, that will quickly be forgot, and then we shall be no wiser than we were.

A.

Why may not men be taught their duty, that is, the science of just and unjust, as divers other sciences have been taught, from true principles and evident demonstration; and much more easily than any of those preachers and democratical gentlemen could teach rebellion and treason?

B.

But who can teach what none have learned? Or, if any man hath been so singular, as to have studied the science of justice and equity; how can he teach it safely, when it is against the interest of those that are in possession of the power to hurt him?

A.

The rules of just and unjust sufficiently demonstrated, and from principles evident to the meanest capacity, have not been wanting; and notwithstanding the obscurity of their author, have shined, not only in

this, but also in foreign countries, to men of good education. But they are few, in respect of the rest of the men, whereof many cannot read; many, though they can, have no leisure; and of them that have leisure, the greatest part have their minds wholly employed and taken up by their private businesses or pleasures. So that it is impossible that the multitude should ever learn their duty, but from the pulpit and upon holidays; but then, and from thence, it is, that they learned their disobedience. And, therefore, the light of that doctrine has been hitherto covered and kept under here by a cloud of adversaries, which no private man's reputation can break through, without the authority of the Universities. But out of the Universities, came all those preachers that taught the contrary. The Universities have been to this nation, as the wooden horse was to the Trojans.

B.

Can you tell me why and when the Universities here, and in other places, first began?

A.

It seems, for the time, they began in the reign of the Emperor Charles the Great. Before which time, I doubt not, but that there were many grammar schools for the Latin tongue, which was the natural language of the Roman Church; but for Universities, that is to say, schools for the sciences in general, and especially for divinity, it is manifest that the institution of them was recommended by the Pope's letter to the Emperor Charles the Great, and recommended further by a Council held in his time, I think, at Chalons-sur-Saone; and not long after was erected an University at Paris, and the college called University College at Oxford. And so by degrees several bishops, noblemen, and rich men,

and some Kings and Queens, contributing thereunto, the Universities obtained at last their present splendour.

B.

But what was the Pope's design in it?

A.

What other design was he like to have, but what you heard before, the advancement of his own authority in the countries where the Universities were erected? There they learned to dispute for him, and with unintelligible distinctions to blind men's eyes, whilst they encroached upon the rights of kings. And it was an evident argument of that design, that they fell in hand with the work so quickly. For the first Rector of the University of Paris, as I have read somewhere, was Peter Lombard, who first brought in them the learning called School-divinity; and was seconded by John Scot of Duns, who lived in, or near the same time; whom any ingenious reader, not knowing what was the design, would judge to have been two of the most egregious blockheads in the world, so obscure and senseless are their writings. And from these the schoolmen that succeeded, learnt the trick of imposing what they list upon their readers, and declining the force of true reason by verbal forks; I mean, distinctions that signify nothing, but serve only to astonish the multitude of ignorant men. As for the understanding readers, they were so few, that these new sublime doctors cared not what they thought. These schoolmen were to make good all the articles of faith, which the Popes from time to time should command to be believed: amongst which, there were very many inconsistent with the rights of kings, and other civil sovereigns, as asserting to the Pope all

authority whatsoever they should declare to be necessary in ordine ad spiritualia, that is to say, in order to religion.

From the Universities also it was, that all preachers proceeded, and were poured out into city and country, to terrify the people into an absolute obedience to the Pope's canons and commands, which, for fear of weakening kings and princes too much, they durst not yet call laws.

From the Universities it was, that the philosophy of Aristotle was made an ingredient in religion, as serving for a salve to a great many absurd articles, concerning the nature of Christ's body, and the estate of angels and saints in heaven; which articles they thought fit to have believed, because they bring, some of them profit, and others reverence to the clergy, even to the meanest of them. For when they shall have made the people believe that the meanest of them can make the body of Christ; who is there that will not both show them reverence, and be liberal to them or to the Church, especially in the time of their sickness, when they think they make and bring unto them their Saviour?

B.

But, what advantage to them, in these impostures, was the doctrine of Aristotle?

A.

They have made more use of his obscurity than of his doctrine. For none of the ancient philosophers' writings are comparable to those of Aristotle, for their aptness to puzzle and entangle men with words, and to breed disputation, which must at last be ended in the determination of the Church of Rome. And yet in the doctrine of Aristotle, they made use of many points; as, first, the doctrine of separated essences.

B.

What are separated essences?

A.

Separated beings.

B.

Separated from what?

A.

From every thing that is.

B.

I cannot understand the being of any thing, which I understand not to be. But what can they make of that?

A.

Very much, in questions concerning the nature of God, and concerning the estate of man's soul after death, in heaven, hell, and purgatory; by which you and every man know, how great obedience, and how much money they gain from the common people. Whereas Aristotle holdeth the soul of man to be the first giver of motion to the body, and consequently to itself; they make use of that in the doctrine of free will. What, and how they gain by that, I will not say. He holdeth forth, that there be many things that come to pass in this world from no necessity of causes, but mere contingency, casualty, and fortune.

B.

Methinks, in this they make God stand idle, and to be a mere spectator of the games of fortune; for what God is the cause of, must needs come to pass, and, in my opinion, nothing else. But, because there must be some ground for the justice of the eternal torment of the damned; perhaps it is this, that men's wills and propensions are not, they think, in the hands of God, but of themselves; and in this also I see somewhat conducing to the authority of the Church.

A.

This is not much; nor was Aristotle of such credit with them, but that when his opinion was against theirs, they could slight him. What-soever he says is impossible in nature, they can prove well enough to be possible, from the Almighty power of God, who can make many bodies to be in one and the self-same place, and one body to be in many places at the same time, if the doctrine of transubstantiation require it, though Aristotle deny it. I like not the design of drawing religion into an art, whereas it ought to be a law; and though not the same in all countries, yet in every country indisputable; nor that they teach it not, as arts ought to be taught, by shewing first the meaning of their terms, and then deriving from them the truth they would have us believe: nor that their terms are for the most part unintelligible; though, to make it seem rather want of learning in the reader, than want of fair dealing in themselves, they are, for the most part, Latin and Greek words, wryed a little at the point, towards the native language of the several countries where they are used. But that which is most intolerable is, that all clerks are forced to make as if they believed them, if they mean to have any Church preferment, the keys whereof are in the Pope's hands; and the common

people, whatsoever they believe of those subtile doctrines, are never esteemed better sons of the Church for their learning. There is but one way there to salvation; that is, extraordinary devotion and liberality to the Church, and readiness for the Church's sake, if it be required, to fight against their natural and lawful sovereigns.

B.

I see what use they make of Aristotle's logic, physics, and metaphysics; but I see not yet how his politics can serve their turn.

A.

Nor I. It has, I think, done them no good, though it has done us here much hurt by accident. For men, grown weary at last of the insolence of the priests, and examining the truth of these doctrines that were put upon them, began to search the sense of the Scriptures, as they are in the learned languages; and consequently studying Greek and Latin, became acquainted with the democratical principles of Aristotle and Cicero, and from the love of their eloquence fell in love with their politics, and that more and more, till it grew into the rebellion we now talk of, without any other advantage to the Roman Church but that it was a weakening to us, whom, since we broke out of their net in the time of Henry VIII, they have continually endeavoured to recover.

B.

What have they gotten by the teaching of Aristotle's ethics?

A.

It is some advantage to them, that neither the morals of Aristotle, nor of any other, have done them any harm, nor us any good. Their doctrines have caused a great deal of dispute concerning virtue and vice, but no knowledge of what they are, nor any method of obtaining virtue nor of avoiding vice. The end of moral philosophy is, to teach men of all sorts their duty, both to the public and to one another. They estimate virtue, partly by a mediocrity of the passions of men, and partly by that that they are praised. Whereas, it is not the much or little praise that makes an action virtuous, but the cause; nor much or little blame that makes an action vicious, but its being unconformable to the laws in such men as are subject to the law, or its being unconformable to equity or charity in all men whatsoever.

B.

It seems you make a difference between the ethics of subjects, and the ethics of sovereigns.

A.

So I do. The virtue of a subject is comprehended wholly in obedience to the laws of the commonwealth. To obey the laws, is justice and equity, which is the law of nature, and, consequently, is civil law in all nations of the world; and nothing is injustice or iniquity, otherwise, than it is against the law. Likewise, to obey the laws, is the prudence of a subject; for without such obedience the commonwealth (which is every subject's safety and protection) cannot subsist. And though it be prudence also in private men, justly and moderately to enrich themselves, yet craftily to withhold from the public or defraud it of such part of their wealth, as is by law required, is no sign of prudence, but of want of knowledge of what is necessary for their own defence.

The virtues of sovereigns are such as tend to the maintenance of peace at home, and to the resistance of foreign enemies. Fortitude is a royal virtue; and though it be necessary in such private men as shall be soldiers, yet, for other men, the less they dare, the better it is both for the commonwealth and for themselves. Frugality (though perhaps you will think it strange) is also a royal virtue: for it increases the public stock, which cannot be too great for the public use, nor any man too sparing of what he has in trust for the good of others. Liberality also is a royal virtue: for the commonwealth cannot be well served without extraordinary diligence and service of ministers, and great fidelity to their Sovereign; who ought therefore to be encouraged, and especially those that do him service in the wars. In sum, all actions and habits are to be esteemed good or evil by their causes and usefulness in reference to the commonwealth, and not by their mediocrity, nor by their being commended. For several men praise several customs, and that which is virtue with one, is blamed by others; and, contrarily, what one calls vice, another calls virtue, as their present affections lead them.

B.

Methinks you should have placed among the virtues that, which, in my opinion, is the greatest of all virtues, religion.

A.

So I have, though, it seems, you did not observe it. But whither do we digress from the way we were in?

B.

I think you have not digressed at all; for I suppose, your purpose was, to acquaint me with the history, not so much of those actions that passed in the time of the late troubles, as of their causes, and of the councils and artifice by which they were brought to pass. There be divers men that have written the history, out of whom I might have learned what they did, and somewhat also of the contrivance; but I find little in them of what I would ask. Therefore, since you were pleased to enter into this discourse at my request, be pleased also to inform me after my own method; and for the danger of confusion that may arise from that, I will take care to bring you back to the place from whence I drew you; for I well remember where it was.

A.

Well then, to your question concerning religion, inasmuch as I told you, that all virtue is comprehended in obedience to the laws of the commonwealth, whereof religion is one, I have placed religion amongst the virtues.

B.

Is religion then the law of a commonwealth?

A.

There is no nation in the world, whose religion is not established, and receives not its authority from the laws of that nation. It is true, that the law of God receives no evidence from the laws of men. But because men can never by their own wisdom come to the knowledge of what God hath spoken and commanded to be observed, nor be obliged to obey the laws whose author they know not, they are to acquiesce in

some human authority or other. So that the question will be, whether a man ought in matter of religion, that is to say, when there is question of his duty to God and the King, to rely upon the preaching of his fellow-subjects or of a stranger, or upon the voice of the law?

B.

There is no great difficulty in that point. For there are none that preach here or anywhere else, or at least ought to preach, but such as have authority so to do from him or them that have the sovereign power. So that if the King gives us leave, you or I may as lawfully preach as they that do; and I believe we should perform that office a great deal better, than they that preached us into the rebellion.

A.

The Church morals are in many points very different from these, that I have here set down, for the doctrine of virtue and vice; and yet without any conformity with that of Aristotle. For in the Church of Rome, the principal virtues are, to obey their doctrine, though it be treason, and that is to be religious; to be beneficial to the clergy, that is their piety and liberality; and to believe upon their word that which a man knows in his conscience to be false, which is the faith they require. I could name a great many more such points of their morals, but that I know you know them already, being so well versed in the cases of conscience written by their schoolmen, who measure the goodness and wickedness of all actions, by their congruity with the doctrine of the Roman clergy.

B.

But what is the moral philosophy of the Protestant clergy in England?

A.

So much as they show of it in their life and conversation, is for the most part very good, and of very good example; much better than their writings.

B.

It happens many times that men live honestly for fear, who, if they had power, would live according to their own opinions; that is, if their opinions be not right, unrighteously.

A.

Do the clergy in England pretend, as the Pope does, or as the Presbyterians do, to have a right from God immediately, to govern the King and his subjects in all points of religion and manners? If they do, you cannot doubt but that if they had number and strength, which they are never like to have, they would attempt to obtain that power, as the others have done.

B.

I would be glad to see a system of the present morals, written by some divine of good reputation and learning, of the late King's party.

A.

I think I can recommend unto you the best that is extant, and such a one as (except a few passages that I dislike) is very well worth your reading. The title of it is, The whole Duty of Man laid down in a plain and familiar way. And, yet, I dare say, that if the Presbyterian ministers,

even those of them which were the most diligent preachers of the late sedition, were to be tried by it, they would go near to be found not guilty. He has divided the duty of man into three great branches; which are, his duty to God, to himself, and to his neighbour. In his duty to God, he puts the acknowledgment of him in his essence and his attributes, and in the believing of his word. His attributes are omnipotence, omniscience, infiniteness, justice, truth, mercy, and all the rest that are found in Scripture. Which of these did not those seditious preachers acknowledge equally with the best of Christians? The word of God are the books of Holy Scripture, received for canonical in England.

B.

They receive the word of God; but it is according to their own interpretation.

A.

According to whose interpretation was it received by the bishops and the rest of the loyal party, but their own? He puts for another duty, obedience and submission to God's will. Did any of them, nay, did any man living, do any thing, at any time, against God's will?

B.

By God's will, I suppose, he means there his revealed will, that is to say, his commandments, which I am sure they did most horribly break, both by their preaching and otherwise.

A.

As for their own actions, there is no doubt but all men are guilty enough, if God deal severely with them, to be damned. And for their preaching, they will say, they thought it agreeable to God's revealed will in the Scriptures. If they thought it so, it was not disobedience, but error. And how can any man prove they thought otherwise?

B.

Hypocrisy hath this great prerogative above other sins, that it cannot be accused.

A.

Another duty he sets down is, to honour Him in his house (that is, the Church), in his possessions, in his day, in his word and sacraments.

B.

They perform this duty as well, I think, as any other ministers, I mean the loyal party; and the Presbyterians have always had an equal care to have God's house free from profanation; to have tithes duly paid, and offerings accepted; to have the sabbath day kept holy, the word preached, and the Lord's supper and baptism duly administered. But is not keeping of the feasts and fasts, one of those duties that belong to the honour of God? If it be, the Presbyterians fail in that.

A.

Why so? They kept some holidays, and they had fasts amongst themselves, though not upon the same days that the Church ordains, but when they thought fit; as when it pleased God to give the King any notable victory. And they governed themselves in this point by the Holy

Scripture, as they pretend to believe. And who can prove they do not believe so?

B.

Let us pass over all other duties, and come to that duty which we owe to the King, and consider whether the doctrine taught by those divines which adhered to the King, be such in that point, as may justify the Presbyterians, that incited the people to rebellion. For that is the thing you call in question.

A.

Concerning our duty to our rulers, he hath these words: “An obedience we must pay, either active or passive; the active, in the case of all lawful commands, that is, whenever the magistrate commands something which is not contrary to some command of God, we are then bound to act according to that command of the magistrate, to do the things he requires; but when he enjoins any thing contrary to what God hath commanded, we are not then to pay him this active obedience; we may, nay we must, refuse thus to act (yet, here we must be very well assured, that the thing is so contrary, and not pretend conscience for a cloak of stubbornness); we are, in that case, to obey God rather than men; but even this is a season for the passive obedience; we must patiently suffer what he inflicts on us for such refusal, and not, to secure ourselves, rise up against him.”

B.

What is there in this, to give colour to the late rebellion?

A.

They will say they did it in obedience to God, inasmuch as they did believe it was according to the Scripture; out of which they will bring examples, perhaps of David and his adherents, that resisted King Saul, and of the prophets afterward, that vehemently from time to time preached against the idolatrous Kings of Israel and Judah. Saul was their lawful King, and yet they paid him neither active nor passive obedience; for they did put themselves into a posture of defence against him, though David himself spared his person. And so did the Presbyterians put into their commissions to their general, that they should spare the King's person. Besides, you cannot doubt but that they, who in the pulpit did animate the people to take arms in the defence of the then Parliament, alleged Scripture, that is, the word of God for it. If it be lawful then for subjects to resist the King, when he commands anything that is against the Scripture, that is, contrary to the command of God, and to be judge of the meaning of the Scripture, it is impossible that the life of any King, or the peace of any Christian kingdom, can be long secure. It is this doctrine that divides a kingdom within itself, whatsoever the men be, loyal or rebels, that write or preach it publicly. And thus you see that if those seditious ministers be tried by this doctrine, they will come off well enough.

B.

I see it; and wonder at people that have never spoken with God Almighty, nor knowing one more than another what he hath said, when the laws and the preacher disagree, should so keenly follow the minister, (for the most part an ignorant, though a ready-tongued, scholar), rather

than the laws, that were made by the King with the consent of the peers and the commons of the land.

A.

Let us examine his words a little nearer. First, concerning passive obedience. When a thief hath broken the laws, and according to the law is therefore executed, can any man understand that this suffering of his is in obedience to the law? Every law is a command to do, or to forbear: neither of these is fulfilled by suffering. If any suffering can be called obedience, it must be such as is voluntary; for no involuntary action can be counted a submission to the law. He that means that his suffering should be taken for obedience, must not only not resist, but also not fly, nor hide himself to avoid his punishment. And who is there amongst them that discourse of passive obedience, when his life is in extreme danger, that will voluntarily present himself to the officers of justice? Do not we see that all men, when they are led to execution, are both bound and guarded, and would break loose if they could, and get away? Such is their passive obedience. Christ saith (Matth. xxiii, 2, 3): The Scribes and Pharisees sit in Moses' chair; all therefore, whatsoever they bid you observe, that observe and do: which is a doing an active obedience. And yet the Scribes and Pharisees appear not by the Scripture to have been such godly men, as never to command any thing against the revealed will of God.

B.

Must tyrants also be obeyed in every thing actively? Or is there nothing wherein a lawful King's command may be disobeyed? What if he should command me with my own hands to execute my father, in case he should be condemned to die by the law?

A.

This is a case that need not be put. We never have read nor heard of any King or tyrant so inhuman as to command it. If any did, we are to consider whether that command were one of his laws. For by disobeying Kings, we mean the disobeying of his laws, those his laws that were made before they were applied to any particular person; for the King, though as a father of children, and a master of domestic servants, yet he commands the people in general never but by a precedent law, and as a politic, not a natural person. And if such a command as you speak of were contrived into a general law (which never was, nor never will be), you were bound to obey it, unless you depart the kingdom after the publication of the law, and before the condemnation of your father.

B.

Your author says further, in refusing active obedience to the King, that commanded anything contrary to God's law, we must be very well assured that the thing is so contrary. I would fain know how it is possible to be assured.

A.

I think you do not believe that any of those refusers do, immediately from God's own mouth, receive any command contrary to the command of the King, who is God's lieutenant, nor any other way than you and I do, that is to say, than by the Scriptures. And because men do, for the most part, rather draw the Scripture to their own sense, than follow the true sense of the Scripture, there is no other way to know, certainly, and in all cases, what God commands, or forbids us to do, but by the sentence of him or them that are constituted by the King to determine

the sense of the Scripture, upon hearing of the particular case of conscience which is in question. And they that are so constituted, are easily known in all Christian commonwealths, whether they be bishops, or ministers, or assemblies, that govern the Church under him or them that have the sovereign power.

B.

Some doubts may be raised from this that you now say. For if men be to learn their duty from the sentence which other men shall give concerning the meaning of the Scriptures, and not from their own interpretation, I understand not to what end they were translated into English, and every man not only permitted, but also exhorted, to read them. For what could that produce, but diversity of opinion, and consequently, as man's nature is, disputation, breach of charity, disobedience, and at last rebellion? Again, since the Scripture was allowed to be read in English, why were not the translations such as might make all that is read, understood even by mean capacities? Did not the Jews, such as could read, understand their law in the Jewish language, as well as we do our statute laws in English? And as for such places of the Scripture, as had nothing of the nature of a law, it was nothing to the duty of the Jews, whether they were understood or not, seeing nothing is punishable but the transgression of some law. The same question I may ask concerning the New Testament. For, I believe, that those men to whom the original language was natural, did understand sufficiently what commands and councils were given them by our Saviour and his apostles, and his immediate disciples. Again, how will you answer that question which was put by St. Peter and St. John (Acts iv, 19), when by Annas the high-priest, and others of the Council of Jerusalem, they were forbidden to teach any more in the

name of Jesus: Whether it is right in the sight of God, to hearken unto you more than unto God?

A.

The case is not the same. Peter and John had seen and daily conversed with our Saviour; and by the miracles he wrought, did know he was God, and consequently knew certainly that their disobedience to the high-priest's present command was just. Can any minister now say, that he hath immediately from God's own mouth received a command to disobey the King, or know otherwise than by the Scripture, that any command of the King, that hath the form and nature of a law, is against the law of God, which in divers places, directly and evidently, commandeth to obey him in all things? The text you cite does not tell us, that a minister's authority, rather than a Christian King's, shall decide the questions that arise from the different interpretations of the Scripture. And therefore, where the King is head of the Church, and by consequence (to omit that the Scripture itself was not received but by the authority of Kings and States) chief judge of the rectitude of all interpretations of the Scripture, to obey the King's laws and public edicts, is not to disobey, but to obey God. A minister ought not to think that his skill in the Latin, Greek, or Hebrew tongues, if he have any, gives him a privilege to impose upon all his fellow subjects his own sense, or what he pretends to be his sense, of every obscure place of Scripture: nor ought he, as oft as he hath found out some fine interpretation, not before thought on by others, to think he had it by inspiration: for he cannot be assured of that; no, nor that his interpretation, as fine as he thinks it, is not false: and then all his stubbornness and contumacy towards the King and his laws, is nothing but pride of heart and ambition, or else imposture. And whereas you

think it needless, or perhaps hurtful, to have the Scriptures in English, I am of another mind. There are so many places of Scripture easy to be understood, that teach both true faith and good morality (and that as fully as is necessary to salvation), of which no seducer is able to dispossess the mind of any ordinary reader, that the reading of them is so profitable as not to be forbidden without great damage to them and the commonwealth.

B.

All that is required, both in faith and manners, for man's salvation, is, I confess, set down in Scripture as plainly as can be. Children obey your parents in all things: Servants obey your masters: Let all men be subject to the higher powers whether it be the King or those that are sent by him: Love God with all your soul, and your neighbour as yourself: are words of the Scripture, which are well enough understood; but neither children, nor the greatest part of men, do understand why it is their duty to do so. They see not that the safety of the commonwealth, and consequently their own, depends upon their doing it. Every man by nature, without discipline, does in all his actions look upon, as far as he can see, the benefit that shall redound to himself from his obedience. He reads that covetousness is the root of all evil; but he thinks, and sometimes finds, it is the root of his estate. And so in other cases the Scripture says one thing, and they think another, weighing the commodities or incommunities of this present life only, which are in their sight, never putting into the scales the good and evil of the life to come, which they see not.

A.

All this is no more than happens where the Scripture is sealed up in Greek and Latin, and the people taught the same things out of them by preachers. But they that are of a condition and age fit to examine the sense of what they read, and that take a delight in searching out the grounds of their duty, certainly cannot choose but by their reading of the Scriptures come to such a sense of their duty, as not only to obey the laws themselves, but also to induce others to do the same. For commonly men of age and quality are followed by their inferior neighbours, that look more upon the example of those men whom they reverence, and whom they are unwilling to displease, than upon precepts and laws.

B.

These men, of the condition and age you speak of, are, in my opinion, the unfittest of all others to be trusted with the reading of the Scriptures. I know you mean such as have studied the Greek or Latin, or both tongues, and that are withal such as love knowledge, and consequently take delight in finding out the meaning of the most hard texts, or in thinking they have found it, in case it be new and not found out by others. These are therefore they, that prætermittting the easy places which teach them their duty, fall to scanning only of the mysteries of religion. Such as are: How it may be made out with wit, that there be three that bear rule in heaven, and those three but one? How the Deity could be made flesh? How that flesh could be really present in many places at once? Where is the place, and what the torments, of hell? And other metaphysical doctrines: Whether the will of man be free, or governed by the will of God? Whether sanctity comes by inspiration or education? By whom Christ now speaks to us, whether by the King, or by the clergy, or by the Bible, to every man that reads it and interprets it

to himself, or by a private spirit to every private man? These and the like points are the study of the curious, and the cause of all our late mischief, and the cause that makes the plainer sort of men, whom the Scripture had taught belief in Christ, love towards God, obedience to the King, and sobriety of behaviour, forget it all, and place their religion in the disputable doctrines of these your wise men.

A.

I do not think these men fit to interpret the Scripture to the rest, nor do I say that the rest ought to take their interpretation for the word of God. Whatsoever is necessary for them to know, is so easy, as not to need interpretation: whatsoever is more, does them no good. But in case any of those unnecessary doctrines shall be authorized by the laws of the King or other state, I say it is the duty of every subject not to speak against them: in as much as it is every man's duty to obey him or them that have the sovereign power, and the wisdom of all such powers to punish such as shall publish or teach their private interpretations, when they are contrary to the law, and likely to incline men to sedition or disputing against the law.

B.

They must punish then the most of those that have had their breeding in the Universities. For such curious questions in divinity are first started in the Universities, and so are all those politic questions concerning the rights of civil and ecclesiastic government; and there they are furnished with arguments for liberty out of the works of Aristotle, Plato, Cicero, Seneca, and out of the histories of Rome and Greece, for their disputation against the necessary power of their sovereigns. Therefore I despair of any lasting peace amongst ourselves, till the Universities here

shall bend and direct their studies to the settling of it, that is, to the teaching of absolute obedience to the laws of the King, and to his public edicts under the Great Seal of England. For I make no doubt, but that solid reason, backed with the authority of so many learned men, will more prevail for the keeping of us in peace within ourselves, than any victory can do over the rebels. But I am afraid that it is impossible to bring the Universities to such a compliance with the actions of state, as is necessary for the business.

A.

Seeing the Universities have heretofore from time to time maintained the authority of the Pope, contrary to all laws divine, civil, and natural, against the right of our Kings, why can they not as well, when they have all manner of laws and equity on their side, maintain the rights of him that is both sovereign of the kingdom, and head of the Church?

B.

Why then were they not in all points for the King's power, presently after that King Henry VIII was in Parliament declared head of the Church, as much as they were before for the authority of the Pope?

A.

Because the clergy in the Universities, by whom all things there are governed, and the clergy without the Universities, as well bishps as inferior clerks, did think that the pulling down of the Pope was the setting up of them, as to England, in his place, and made no question, the greatest part of them, but that their spiritual power did depend not upon the authority of the King, but of Christ himself, derived to them by

a successive imposition of hands from bishop to bishop; notwithstanding they knew that this derivation passed through the hands of popes and bishops whose authority they had cast off. For though they were content that the divine right, which the Pope pretended to in England, should be denied him, yet they thought it not so fit to be taken from the Church of England, whom they now supposed themselves to represent. It seems they did not think it reasonable that a woman, or a child, or a man that could not construe the Hebrew, Greek, or Latin Bible, nor know perhaps the declensions and conjugations of Greek or Latin nouns and verbs, should take upon him to govern so many learned doctors in matters of religion; meaning matters of divinity: for religion has been for a long time, and is now by most people, taken for the same thing with divinity, to the great advantage of the clergy.

B.

And especially now amongst the Presbyterians. For I see few that are by them esteemed very good Christians, besides such as can repeat their sermons, and wrangle for them about the interpretation of the Scripture, and fight for them also with their bodies or purses, when they shall be required. To believe in Christ is nothing with them, unless you believe as they bid you. Charity is nothing with them, unless it be charity and liberality to them, and partaking with them in faction. How we can have peace while this is our religion, I cannot tell. *Hæret lateri lethalis arundo*. The seditious doctrine of the Presbyterians has been stuck so hard in the people's heads and memories, (I cannot say into their hearts; for they understand nothing in it, but that they may lawfully rebel), that I fear the commonwealth will never be cured.

A.

The two great virtues, that were severally in Henry VII and Henry VIII, when they shall be jointly in one King, will easily cure it. That of Henry VII was, without much noise of the people to fill his coffers; that of Henry VIII was an early severity; but this without the former cannot be exercised.

B.

This that you say looks, methinks, like an advice to the King, to let them alone till he have gotten ready money enough to levy and maintain a sufficient army, and then to fall upon them and destroy them.

A.

God forbid that so horrible, unchristian, and inhuman a design should ever enter into the King's heart. I would have him have money enough readily to raise an army able to suppress any rebellion, and to take from his enemies all hope of success, that they may not dare to trouble him in the reformation of the Universities; but to put none to death without the actual committing such crimes as are already made capital by the laws. The core of rebellion, as you have seen by this, and read of other rebellions, are the Universities; which nevertheless are not to be cast away, but to be better disciplined: that is to say, that the politics there taught be made to be, as true politics should be, such as are fit to make men know, that it is their duty to obey all laws whatsoever that shall by the authority of the King be enacted, till by the same authority they shall be repealed; such as are fit to make men understand, that the civil laws are God's laws, as they that make them are by God appointed to make them and to make men know, that the people and the Church are one thing, and have but one head, the King; and that no man has title to govern under him, that has it not from him; that the King owes his

crown to God only, and to no man, ecclesiastic or other; and that the religion they teach there, be a quiet waiting for the coming again of our blessed Saviour, and in the mean time a resolution to obey the King's laws, which also are God's laws; to injure no man, to be in charity with all men, to cherish the poor and sick, and to live soberly and free from scandal; without mingling our religion with points of natural philosophy, as freedom of will, incorporeal substance, everlasting nows, ubiquities, hypostases, which the people understand not, nor will ever care for. When the Universities shall be thus disciplined, there will come out of them, from time to time, well-principled preachers, and they that are now ill-principled, from time to time fall away.

B.

I think it a very good course, and perhaps the only one that can make our peace amongst ourselves constant. For if men know not their duty, what is there that can force them to obey the laws? An army, you will say. But what shall force the army? Were not the trained bands an army? Were they not the janissaries, that not very long ago slew Osman in his own palace at Constantinople? I am therefore of your opinion, both that men may be brought to a love of obedience by preachers and gentlemen that imbibe good principles in their youth at the Universities, and also that we never shall have a lasting peace, till the Universities themselves be in such manner, as you have said, reformed; and the ministers know they have no authority but what the supreme civil power gives them; and the nobility and gentry know that the liberty of a state is not an exemption from the laws of their own country, whether made by an assembly or by a monarch, but an exemption from the constraint and insolence of their neighbours.

And now I am satisfied in this point, I will bring you back to the place from whence my curiosity drew you to this long digression. We were upon the point of ship-money; one of those grievances which the Parliament exclaimed against as tyrannical and arbitrary government; thereby to single out, as you called it, the King from his subjects, and to make a party against him, when they should need it. And now you may proceed, if it please you, to such other artifices as they used to the same purpose.

A.

I think it were better to give over here our discourse of this business, and refer it to some other day that you shall think fit.

B.

Content. That day I believe is not far off.

PART II.

A.

You are welcome; yet, if you had staid somewhat longer, my memory would have been so much the better provided for you.

B.

Nay, I pray you give me now what you have about you; for the rest I am content you take what time you please.

A.

After the Parliament had made the people believe that the exacting of ship-money was unlawful, and the people thereby inclined to think it tyrannical; in the next place, to increase their disaffection to his Majesty, they accused him of a purpose to introduce and authorize the Roman religion in this kingdom: than which nothing was more hateful to the people; not because it was erroneous, which they had neither learning nor judgment enough to examine, but because they had been used to hear it inveighed against in the sermons and discourses of the preachers whom they trusted to. And this was indeed the most effectual calumny, to alienate the people's affections from him, that could possibly be invented. The colour they had for this slander was, first, that there was one Rosetti, Resident, at and a little before that time, from the Pope, with the Queen; and one Mr. George Con, Secretary to the Cardinal Francisco Barberini, nephew to Pope Urban VIII, sent over, under

favour and protection of the Queen, as was conceived, to draw as many persons of quality about the court, as he should be able, to reconcile themselves to the Church of Rome: with what success I cannot tell; but it is likely he gained some, especially of the weaker sex; if I may say, they were gained by him, when not his arguments, but hope of favour from the Queen, in all probability prevailed upon them.

B.

In such a conjuncture as that was, it had perhaps been better they had not been sent.

A.

There was exception also taken at a convent of friars-capucins in Somerset-House, though allowed by the articles of marriage: and it was reported, that the Jesuits also were shortly after to be allowed a convent in Clerkenwell. And in the mean time, the principal secretary, Sir Francis Windebank, was accused for having by his warrant set at liberty some English Jesuits, that had been taken and imprisoned for returning into England after banishment, contrary to the statute which had made it capital. Also the resort of English Catholics to the Queen's chapel, gave them colour to blame the Queen herself, not only for that, but also for all the favours that had been shown to the Catholics; in so much that some of them did not stick to say openly, that the King was governed by her.

B.

Stange injustice! The Queen was a Catholic by profession, and therefore could not but endeavour to do the Catholics all the good she could: she

had not else been truly that which she professed to be. But it seems they meant to force her to hypocrisy, being hypocrites themselves. Can any man think it a crime in a devout lady, of what sect soever, to seek the favour and benediction of that Church whereof she is a member?

A.

To give the Parliament another colour for their accusation on foot of the King, as to introducing of Popery, there was a great controversy between the Episcopal and Presbyterian clergy about free-will. The dispute began first in the Low Countries, between Gomar and Arminius, in the time of King James, who foreseeing it might trouble the Church of England, did what he could to compose the difference. And an assembly of divines was thereupon got together at Dort, to which also King James sent a divine or two, but it came to nothing; the question was left undecided, and became a subject to be disputed of in the universities here. All the Presbyterians were of the same mind with Gomar: but a very great many others not; and those were called here Arminians, who, because the doctrine of free-will had been exploded as a Papistical doctrine, and because the Presbyterians were far the greater number, and already in favour with the people, were generally hated. It was easy, therefore, for the Parliament to make that calumny pass currently with the people, when the Archbishop of Canterbury, Dr. Laud, was for Arminius, and had a little before, by his power ecclesiastical, forbidden all ministers to preach to the people of predestination; and when all ministers that were gracious with him, and hoped for any Church preferment, fell to preaching and writing for free-will, to the uttermost of their power, as a proof of their ability and merit. Besides, they gave out, some of them, that the Archbishop was in heart a Papist; and in case he could effect a toleration here of the Roman

religion, was to have a cardinal's hat: which was not only false, but also without any ground at all for a suspicion.

B.

It is a strange thing, that scholars, obscure men that could receive no clarity but from the flame of the state, should be suffered to bring their unnecessary disputes, and together with them their quarrels, out of the universities into the commonwealth; and more strange, that the state should engage in their parties, and not rather put them both to silence.

A.

A state can constrain obedience, but convince no error, nor alter the mind of them that believe they have the better reason. Suppression of doctrines does but unite and exasperate, that is, increase both the malice and power of them that have already believed them.

B.

But what are the points they disagree in? Is there any controversy between Bishop and Presbyterian concerning the divinity or humanity of Christ? Do either of them deny the Trinity, or any article of the creed? Does either party preach openly, or write directly, against justice, charity, sobriety, or any other duty necessary to salvation, except only the duty to the King; and not that neither, but when they have a mind either to rule or destroy the King? Lord have mercy upon us! Can nobody be saved that understands not their disputations? Or is there more requisite, either of faith or honesty, for the salvation of one man than another? What needs so much preaching of faith to us that are no heathens, and that believe already all that Christ and his apostles have

told us is necessary to salvation, and more too? Why is there so little preaching of justice? I have indeed heard righteousness often recommended to the people, but I have seldom heard the word justice in their sermons; nay, though in the Latin and Greek Bible the word justice occur exceeding often, yet in the English, though it be a word that every man understands, the word righteousness (which few understand to signify the same, but take it rather for rightness of opinion, than of action or intention), is put in the place of it.

A.

I confess I know very few controversies amongst Christians, of points necessary to salvation. They are the questions of authority and power over the Church, or of profit, or of honour to Churchmen, that for the most part raise all the controversies. For what man is he, that will trouble himself and fall out with his neighbours for the saving of my soul, or the soul of any other than himself? When the Presbyterian ministers and others did so seriously preach sedition, and animate men to rebellion in these late wars; who was there that had not a benefice, or having one feared not to lose it, or some other part of his maintainance, by the alteration of the Government, that did voluntary, without any eye to reward, preach so earnestly against sedition, as the other party preached for it? I confess, that for aught I have observed in history, and other writings of the heathens, Greek and Latin, that those heathens were not at all behind us in point of virtue and moral duties, notwithstanding that we have had much preaching, and they none at all. I confess also, that considering what harm may proceed from a liberty that men have, upon every Sunday and oftener, to harangue all the people of a nation at one time, whilst the state is ignorant of what they will say; and that there is no such thing permitted in all the world out of

Christendom, nor therefore any civil wars about religion; I have thought much preaching an inconvenience. Nevertheless, I cannot think that preaching to the people the points of their duty, both to God and man, can be too frequent; so it be done by grave, discreet, and ancient men, that are revered by the people; and not by light quibbling young men, whom no congregation is so simple as to look to be taught by (as being a thing contrary to nature), or to pay them any reverence, or to care what they say, except some few that may be delighted with their jingling. I wish with all my heart, there were enough of such discreet and ancient men, as might suffice for all the parishes of England, and that they would undertake it. But this is but a wish; I leave it to the wisdom of the State to do what it pleaseth.

B.

What did they next?

A.

Whereas the King had sent prisoners into places remote from London, three persons that had been condemned for publishing seditious doctrine, some in writing, some in public sermons; the Parliament (whether with his Majesty's consent or no, I have forgotten), caused them to be released and to return to London; meaning, I think, to try how the people would be pleased therewith, and, by consequence, how their endeavours to draw the people's affections from the King had already prospered. When these three came through London, it was a kind of triumph, the people flocking together to behold them, and receiving them with such acclamations, and almost adoration, as if they had been let down from heaven; insomuch as the Parliament was now sufficiently assured of a great and tumultuous party, whensoever they

should have occasion to use it. On confidence whereof they proceeded to their next plot, which was to deprive the King of such ministers as by their wisdom, courage, and authority, they thought most able to prevent, or oppose their further designs against the King. And first, the House of Commons resolved to impeach the Earl of Strafford, Lord Lieutenant of Ireland, of high-treason.

B.

What was that Earl of Strafford before he had that place? And how had he offended the Parliament or given them cause to think he would be their enemy? For I have heard that in former Parliaments he had been as parliamentary as any other.

A.

His name was Sir Thomas Wentworth, a gentleman both by birth and estate very considerable in his own county, which was Yorkshire; but more considerable for his judgment in the public affairs, not only of that county, but generally of the kingdom; and was therefore often chosen for the Parliament, either as burgess for some borough, or knight of the shire. For his principles of politics, they were the same that were generally proceeded upon by all men else that were thought fit to be chosen for the Parliament; which are commonly these: to take for the rule of justice and government the judgments and acts of former Parliaments, which are commonly called precedents; to endeavour to keep the people from being subject to extra-parliamentary taxes of money, and from being with parliamentary taxes too much oppressed; to preserve to the people their liberty of body from the arbitrary power of the King out of Parliament; to seek redress of grievances.

B.

What grievances?

A.

The grievances were commonly such as these; the King's too much liberality to some favourite; the too much power of some minister or officer of the commonwealth; the misdemeanour of judges, civil or spiritual; but especially all unparliamentary raising of money upon the subjects. And commonly of late, till such grievances be redressed, they refuse, or at least make great difficulty, to furnish the King with money necessary for the most urgent occasions of the commonwealth.

B.

How then can a King discharge his duty as he ought to do, or the subject know which of his masters he is to obey? For here are manifestly two powers, which, when they chance to differ, cannot both be obeyed.

A.

It is true; but they have not often differed so much to the danger of the commonwealth, as they have done in this Parliament, 1640. In all the Parliaments of the late King Charles before the year 1640, my Lord of Strafford did appear in opposition to the King's demands as much as any man, and was for that cause very much esteemed and cried up by the people as a good patriot, and one that courageously stood up in defence of their liberties; and for the same cause was so much the more hated, when afterwards he endeavoured to maintain the royal and just authority of his Majesty.

B.

How came he to change his mind so much as it seems he did?

A.

After the dissolution of the Parliament holden in the years 1627 and 1628, the King, finding no money to be gotten from Parliaments which he was not to buy with the blood of such servants and ministers as he loved best, abstained a long time from calling any more, and had abstained longer if the rebellion of the Scotch had not forced him to it. During that Parliament the King made Sir Thomas Wentworth a baron, recommended to him for his great ability, which was generally taken notice of by the disservice he had done the King in former Parliaments, but which might be useful for him in the times that came on: and not long after he made him of the Council, and after that again Lieutenant of Ireland, which place he discharged with great satisfaction and benefit to his Majesty, and continued in that office, till, by the envy and violence of the Lords and Commons of that unlucky Parliament of 1640, he died. In which year he was made general of the King's forces against the Scots that then entered into England, and the year before, Earl of Strafford. The pacification being made, and the forces on both sides disbanded, and the Parliament at Westminster now sitting, it was not long before the House of Commons accused him to the House of Lords for high-treason.

B.

There was no great probability of his being a traitor to the King, from whose favour he had received his greatness, and from whose protection

he was to expect his safety. What was the treason they laid to his charge?

A.

Many articles were drawn up against him, but the sum of them was contained in these two: first, that he had traitorously endeavoured to subvert the fundamental laws and government of the realm; and in stead thereof to introduce an arbitrary and tyrannical government against law: secondly, that he had laboured to subvert the rights of Parliaments, and the ancient course of Parliamentary proceedings.

B.

Was this done by him without the knowledge of the King?

A.

No.

B.

Why then, if it were treason, did not the King himself call him in question by his attorney? What had the House of Commons to do, without his command, to accuse him in the House of Lords? They might have complained to the King, if he had not known it before. I understand not this law.

A.

Nor I.

B.

Had this been by any former statutes made treason?

A.

Not that I ever heard of; nor do I understand how anything can be treason against the King, that the King, hearing and knowing, does not think treason. But it was a piece of that Parliament's artifice, to put the word traiterously to any article exhibited against any man whose life they meant to take away.

B.

Was there no particular instance of action or words, out of which they argued that endeavour of his to subvert the fundamental laws of Parliament, whereof they accused him?

A.

Yes; they said he gave the King counsel to reduce the Parliament to their duty by the Irish army, which not long before my Lord of Strafford himself had caused to be levied there for the King's service. But it was never proved against him, that he advised the King to use it against the Parliament.

B.

What are those laws that are called fundamental? For I understand not how one law can be more fundamental than another, except only that law of nature that binds us all to obey him, whosoever he be, whom lawfully and for our own safety, we have promised to obey; nor any other fundamental law to a King, but *salus populi*, the safety and well-being of his people.

A.

This Parliament, in the use of their words, when they accused any man, never regarded the signification of them, but the weight they had to aggravate their accusation to the ignorant multitude, which think all faults heinous that are expressed in heinous terms, if they hate the person accused, as they did this man not only for being of the King's party, but also for deserting the Parliament's party as an apostate.

B.

I pray you tell me also what they meant by arbitrary government, which they seemed so much to hate? Is there any governor of a people in the world that is forced to govern them, or forced to make this and that law, whether he will or no? I think not: or if any be, he that forces him does certainly make laws, and govern arbitrarily.

A.

That is true; and the true meaning of the Parliament was, that not the King, but they themselves, should have the arbitrary government, not only of England, but of Ireland, and, as it appeared by the event, of Scotland also.

B.

How the King came by the government of Scotland and Ireland by descent from his ancestors, everybody can tell; but if the King of England and his heirs should chance (which God forbid) to fail, I cannot imagine what title the Parliament of England can acquire thereby to either of those nations.

A.

Yes; they will say they had been conquered anciently by the English subjects' money.

B.

Like enough, and suitable to the rest of their impudence.

A.

Impudence in democratical assemblies does almost all that is done; it is the goddess of rhetoric, and carries proof with it. For what ordinary man will not, from so great boldness of affirmation, conclude there is great probability in the thing affirmed? Upon this accusation he was brought to his trial in Westminster Hall before the House of Lords, and found guilty, and presently after declared traitor by a bill of attainder, that is, by Act of Parliament.

B.

It is a strange thing that the Lords should be induced, upon so light grounds, to give a sentence, or give their assent to a bill, so prejudicial to themselves and their posterity.

A.

It was not well done, and yet, as it seems, not ignorantly; for there is a clause in the bill, that it should not be taken hereafter for an example, that is for a prejudice, in the like case hereafter.

B.

That is worse than the bill itself, and is a plain confession that their sentence was unjust. For what harm is there in the examples of just sentences? Besides, if hereafter the like case should happen, the sentence is not at all made weaker by such a provision.

A.

Indeed I believe that the Lords, most of them, were not of themselves willing to condemn him of treason; they were awed to it by the clamour of common people that came to Westminster, crying out, Justice, Justice against the Earl of Strafford! The which were caused to flock thither by some of the House of Commons, that were well assured, after the triumphant welcome of Prynne, Burton, and Bastwick, to put the people into tumult upon any occasion they desired. They were awed unto it partly also by the House of Commons itself, which if it desired to undo a Lord, had no more to do but to vote him a delinquent.

B.

A delinquent; what is that? A sinner is it not? Did they mean to undo all sinners?

A.

By delinquent they meant only a man to whom they would do all the hurt they could. But the Lords did not yet, I think, suspect they meant to cashier their whole House.

B.

It is a strange thing the whole House of Lords should not perceive that the ruin of the King's power, and the weakening of it, was the ruin, or

weakening of themselves. For they could not think it likely that the people ever meant to take the sovereignty from the King to give it to them, who were few in number, and less in power than so many Commoners, because less beloved by the people.

A.

But it seems not so strange to me. For the Lords, for their personal abilities, as they were no less, so also they were no more skilful in the public affairs, than the knights and burgesses. For there is no reason to think, that if one that is to-day a knight of the shire in the lower House, be to-morrow made a Lord and a member of the higher House, he is therefore wiser than he was before. They are all, of both Houses, prudent and able men as any in the land, in the business of their private estates, which require nothing but diligence and natural wit to govern them. But for the government of a commonwealth, neither wit, nor prudence, nor diligence, is enough, without infallible rules and the true science of equity and justice.

B.

If this be true, it is impossible any commonwealth in the world, whether monarchy, aristocracy, or democracy, should continue long without change, or sedition tending to change, either of the government or of the governors.

A.

It is true; nor have any the greatest commonwealths in the world been long free from sedition. The Greeks had for awhile their petty kings, and then by sedition came to be petty commonwealths; and then growing to

be greater commonwealths, by sedition again became monarchies; and all for want of rules of justice for the common people to take notice of; which if the people had known in the beginning of every of these seditions, the ambitious persons could never have had the hope to disturb their government after it had been once settled. For ambition can do little without hands, and few hands it would have, if the common people were as diligently instructed in the true principles of their duty, as they are terrified and amazed by preachers, with fruitless and dangerous doctrines concerning the nature of man's will, and many other philosophical points that tend not at all to the salvation of the soul in the world to come, nor to their ease in this life, but only to the direction towards the clergy of that duty which they ought to perform to the King.

B.

For aught I see, all the states of Christendom will be subject to these fits of rebellion, as long as the world lasteth.

A.

Like enough; and yet the fault, as I have said, may be easily mended, by mending the Universities.

B.

How long had the Parliament now sitten?

A.

It began November the 3d, 1640. My Lord of Strafford was impeached of treason before the Lords, November the 12th, sent to the Tower

November the 22d, his trial began March the 22d, and ended April the 13th. After his trial he was voted guilty of high-treason in the House of Commons, and after that in the House of Lords, May the 6th, and on the 12th of May beheaded.

B.

Great expedition; but could not the King, for all that, have saved him by a pardon?

A.

The King had heard all that passed at his trial, and had declared he was unsatisfied concerning the justice of their sentence. And, I think, notwithstanding the danger of his own person from the fury of the people, and that he was counselled to give way to his execution, not only by such as he most relied on, but also by the Earl of Strafford himself, he would have pardoned him, if that could have preserved him against the tumult raised and countenanced by the Parliament itself, for the terrifying of those they thought might favour him. And yet the King himself did not stick to confess afterwards, that he had done amiss, in that he did not rescue him.

B.

It was an argument of good disposition in the King. But I never read that Augustus Cæsar acknowledged that he had done a fault, in abandoning Cicero to the fury of his enemy Antonius: perhaps because Cicero, having been of the contrary faction to his father, had done Augustus no service at all out of favour to him, but only out of enmity to Antonius, and out of love to the senate, that is indeed out of love to himself that

swayed the senate; as it is very likely the Earl of Strafford came over to the King's party for his own ends, having been so much against the King in former Parliaments.

A.

We cannot safely judge of men's intentions. But, I have observed often, that such as seek preferment, by their stubbornness have missed of their aim; and on the other side, that those princes that with preferment are forced to buy the obedience of their subjects, are already, or must be soon after, in a very weak condition. For in a market where honour and power is to be bought with stubbornness, there will be a great many as able to buy as my Lord Strafford was.

B.

You have read, that when Hercules fighting with the Hydra, had cut off any one of his many heads, there still arose two other heads in its place; and yet at last he cut them off all.

A.

The story is told false. For Hercules at first did not cut off those heads, but bought them off; and afterwards, when he saw it did him no good, then he cut them off, and got the victory.

B.

What did they next?

A.

After the first impeachment of the Earl of Strafford, the House of Commons, upon December the 18th, accused the Archbishop of Canterbury also of high-treason, that is, of design to introduce arbitrary government, &c.; for which he was, February the 18th, sent to the Tower; but his trial and execution were deferred a long time, till January the 10th, 1643, for the entertainment of the Scots, that were come into England to aid the Parliament.

B.

Why did the Scots think there was so much danger in the Archbishop of Canterbury? He was not a man of war, nor a man able to bring an army into the field; but he was perhaps a very great politician.

A.

That did not appear by any remarkable event of his counsels. I never heard but he was a very honest man for his morals, and a very zealous promoter of the Church-government by bishops, and that desired to have the service of God performed, and the house of God adorned, as suitably as was possible to the honour we ought to do to the Divine Majesty. But to bring, as he did, into the State his former controversies, I mean his squabbings in the University about free-will, and his standing upon punctilios concerning the servicebook and its rubrics, was not, in my opinion, an argument of his sufficiency in affairs of state. About the same time they passed an act, which the King consented to, for a triennial Parliament, wherein was enacted, that after the present Parliament there should be a Parliament called by the King within the space of three years, and so from three years to three years, to meet at Westminster upon a certain day named in the act.

B.

But what if the King did not call it, finding it perhaps inconvenient, or hurtful to the safety or peace of his people, which God hath put into his charge? For I do not well comprehend how any sovereign can well keep a people in order when his hands are tied, or when he hath any other obligation upon him than the benefit of those he governs; and at this time, for any thing you have told me, they acknowledged the King for their sovereign.

A.

I know not; but such was the act. And it was further enacted, that if the King did it not by his own command, then the Lord Chancellor or the Lord Keeper for the time being, should send out the writs of summons; and if the Chancellor refused, then the Sheriffs of the several counties should of themselves, in their next county-courts before the day set down for the Parliament's meeting, proceed to the election of the members for the said Parliament.

B.

But what if the sheriffs refused?

A.

I think they were to be sworn to it: but for that, and other particulars, I refer you to the act.

B.

To whom should they be sworn, when there is no Parliament?

A.

No doubt but to the King, whether there be a Parliament sitting or no.

B.

Then the King may release them of their oath.

A.

Besides, they obtained of the King the putting down the Star-chamber, and the High-Commission Courts.

B.

Besides, if the King, upon the refusal, should fall upon them in anger; who shall (the Parliament not sitting) protect either the Chancellor or the sheriffs in their disobedience?

A.

I pray you do not ask me any reason of such things I understand no better than you. I tell you only an act passed to that purpose, and was signed by the King in the middle of February, a little before the Archbishop was sent to the Tower. Besides this bill, the two Houses of Parliament agreed upon another, wherein it was enacted, that the present Parliament should continue till both the Houses did consent to the dissolution of it; which bill also the King signed the same day he signed the warrant for the execution of the Earl of Strafford.

B.

What a great progress made the Parliament towards the ends of the most seditious Members of both Houses in so little time! They sat down in November, and now it was May; in this space of time, which is but half a year, they won from the King the adherence which was due to him from his people; they drove his faithfulest servants from him; beheaded the Earl of Strafford; imprisoned the Archbishop of Canterbury; obtained a triennial Parliament after their own dissolution, and a continuance of their own sitting as long as they listed: which last amounted to a total extinction of the King's right, in case that such a grant were valid; which I think it is not, unless the Sovereignty itself be in plain terms renounced, which it was not. But what money, by way of subsidy or otherwise, did they grant the King, in recompense of all these his large concessions?

A.

None at all; but often promised they would make him the most glorious King that ever was in England; which were words that passed well enough for well meaning with the common people.

B.

But the Parliament was contented now? For I cannot imagine what they should desire more from the King, than he had now granted them.

A.

Yes; they desired the whole and absolute sovereignty, and to change the monarchical government into an oligarchy; that is to say, to make the Parliament, consisting of a few Lords and about four hundred Commons, absolute in the sovereignty, for the present, and shortly

after to lay the House of Lords aside. For this was the design of the Presbyterian ministers, who taking themselves to be, by divine right, the only lawful governors of the Church, endeavoured to bring the same form of Government into the civil state. And as the spiritual laws were to be made by their synods, so the civil laws should be made by the House of Commons; who, as they thought, would no less be ruled by them afterwards, than they formerly had been: wherein they were deceived, and found themselves outgone by their own disciples, though not in malice, yet in wit.

B.

What followed after this?

A.

In August following, the King supposing he had now sufficiently obliged the Parliament to proceed no further against him, took a journey into Scotland, to satisfy his subjects there, as he had done here; intending, perhaps, so to gain their good wills, that in case the Parliament here should levy arms against him, they should not be aided by the Scots: wherein he also was deceived. For though they seemed satisfied with what he did, whereof one thing was his giving way to the abolition of episcopacy; yet afterwards they made a league with the Parliament, and for money, when the King began to have the better of the Parliament, invaded England in the Parliament's quarrel. But this was a year or two after.

B.

Before you go any further, I desire to know the ground and original of that right, which either the House of Lords, or House of Commons, or both together, now pretend to.

A.

It is a question of things so long past, that they are now forgotten. Nor have we any thing to conjecture by, but the records of our own nation, and some small and obscure fragments of Roman histories: and for the records, seeing they are of things done only, sometimes justly, sometimes unjustly, you can never by them know what right they had, but only what right they pretended.

B.

Howsoever, let me know what light we have in this matter from the Roman histories.

A.

It would be too long, and an useless digression, to cite all the ancient authors that speak of the forms of those commonwealths, which were amongst our first ancestors the Saxons and other Germans, and of other nations, from whom we derive the titles of honour now in use in England; nor will it be possible to derive from them any argument of right, but only examples of fact, which, by the ambition of potent subjects, have been oftener unjust than otherwise. And for those Saxons or Angles, that in ancient times by several invasions made themselves masters of this nation, they were not in themselves one body of a commonwealth, but only a league of divers petty German lords and states, such as was the Grecian army in the Trojan war, without other

obligation than that which proceeded from their own fear and weakness. Nor were those lords, for the most part, the sovereigns at home in their own country, but chosen by the people for the captains of the forces they brought with them. And therefore it was not without equity, when they had conquered any part of the land, and made some one of them king thereof, that the rest should have greater privileges than the common people and soldiers: amongst which privileges, a man may easily conjecture this to be one; that they should be made acquainted, and be of council, with him that hath the sovereignty in matter of government, and have the greatest and most honourable offices both in peace and war. But because there can be no government where there is more than one sovereign, it cannot be inferred that they had a right to oppose the King's resolutions by force, nor to enjoy those honours and places longer than they should continue good subjects. And we find that the Kings of England did, upon every great occasion, call them together by the name of discreet and wise men of the kingdom, and hear their counsel, and make them judges of all causes, that during their sitting were brought before them. But as he summoned them at his own pleasure, so had he also ever the power at his pleasure to dissolve them. The Normans also, that descended from the Germans, as we did, had the same customs in this particular; and by this means, this privilege of the lords to be of the King's great council, and when they were assembled, to be the highest of the King's courts of justice, continued still after the Conquest to this day. But though there be amongst the lords divers names or titles of honour, yet they have their privilege only by the name of baron, a name received from the ancient Gauls; amongst whom, that name signified the King's man, or rather one of his great men: by which it seems to me, that though they gave him counsel when he required it, yet they had no right to make war upon him if he did not follow it.

B.

When began first the House of Commons to be part of the King's great council?

A.

I do not doubt but that before the Conquest some discreet men, and known to be so by the King, were called by special writ to be of the same council, though they were not lords; but that is nothing to the House of Commons. The knights of shires and burgesses were never called to Parliament, for aught that I know, till the beginning of the reign of Edward I, or the latter end of the reign of Henry III, immediately after the misbehaviour of the barons; and, for aught any man knows, were called on purpose to weaken that power of the lords, which they had so freshly abused. Before the time of Henry III, the lords were descended, most of them, from such as in the invasions and conquests of the Germans were peers and fellow-kings, till one was made king of them all; and their tenants were their subjects, as it is at this day with the lords of France. But after the time of Henry III, the kings began to make lords in the place of them whose issue failed, titular only, without the lands belonging to their title; and by that means, their tenants being no longer bound to serve them in the wars, they grew every day less and less able to make a party against the King, though they continued still to be his great council. And as their power decreased, so the power of the House of Commons increased; but I do not find they were part of the King's council at all, nor judges over other men; though it cannot be denied, but a King may ask their advice, as well as the advice of any other. But I do not find that the end of their summoning was to give advice, but only, in case they had any petitions

for redress of grievances, to be ready there with them whilst the King had his great council about him. But neither they nor the lords could present to the King, as a grievance, that the King took upon him to make the laws; to choose his own privy-counsellors; to raise money and soldiers; to defend the peace and honour of the kingdom; to make captains in his army; to make governors of his castles, whom he pleased. For this had been to tell the King, that it was one of their grievances that he was King.

B.

What did the Parliament do, whilst the King was in Scotland?

A.

The King went in August; after which, the Parliament, September the 8th, adjourned till the 20th of October; and the King returned about the end of November following. In which time the most seditious of both Houses, and which had designed the change of government and to cast off monarchy, but yet had not wit enough to set up any other government in its place, and consequently left it to the chance of war, made a cabal amongst themselves; in which they projected how, by seconding one another, to govern the House of Commons, and invented how to put the kingdom, by the power of that House, into a rebellion, which they then called a posture of defence against such dangers from abroad, as they themselves should feign and publish. Besides, whilst the King was in Scotland, the Irish Papists got together a great party, with an intention to massacre the Protestants there, and had laid a design for the seizing, on October the 23rd, of Dublin Castle, where the King's officers of the government of that country made their residence; and had effected it, had it not been discovered the night before. The manner of

the discovery, and the murders they committed in the country afterwards, I need not tell you, since the whole story of it is extant.

B.

I wonder they did not expect and provide for a rebellion in Ireland, as soon as they began to quarrel with the King in England. For was there any body so ignorant, as not to know that the Irish Papists did long for a change of religion there, as well as the Presbyterians in England? Or, that in general, the Irish nation did hate the name of subjection to England, nor would longer be quiet, than they feared an army out of England to chastise them? What better time then could they take for their rebellion than this, wherein they were encouraged, not only by our weakness caused by this division between the King and his Parliament, but also by the example of the Presbyterians, both of the Scotch and English nation? But what did the Parliament do upon this occasion, in the King's absence?

A.

Nothing; but consider what use they might make of it to their own ends; partly, by imputing it to the King's evil counsellors, and partly, by occasion thereof to demand of the King the power of pressing and ordering soldiers; which power whosoever has, has also, without doubt, the whole sovereignty.

B.

When came the King back?

A.

He came back the 25th of November; and was welcomed with the acclamations of the common people, as much as if he had been the most beloved of all the Kings that were before him; but found not a reception by the Parliament, answerable to it. They presently began to pick new quarrels against him, out of every thing he said to them. December the 2nd, the King called together both Houses of Parliament, and then did only recommend unto them the raising of succours for Ireland.

B.

What quarrel could they pick out of that?

A.

None: but in order thereto, as they may pretend, they had a bill in agitation to assert the power of levying and pressing soldiers to the two Houses of the Lords and Commons; which was as much as to take from the King the power of the militia, which is in effect the whole sovereign power. For he that hath the power of levying and commanding the soldiers, has all other rights of sovereignty which he shall please to claim. The King, hearing of it, called the Houses of Parliament together again, on December the 14th, and then pressed again the business of Ireland: (as there was need; for all this while the Irish were murdering the English in Ireland, and strengthening themselves against the forces they expected to come out of England): and withal, told them he took notice of the bill in agitation for pressing of soldiers, and that he was contented it should pass with a salvo jure both for him and them, because the present time was unseasonable to dispute it in.

B.

What was there unreasonable in this?

A.

Nothing: what is unreasonable is one question, what they quarrelled at is another. They quarrelled at this: that his Majesty took notice of the bill, while it was in debate in the House of Lords, before it was presented to him in the course of Parliament; and also that he showed himself displeased with those that propounded the said bill; both which they declared to be against the privileges of Parliament, and petitioned the King to give them reparation against those by whose evil counsel he was induced to it, that they might receive condign punishment.

B.

This was cruel proceeding. Do not the Kings of England use to sit in the Lords' House when they please? And was not this bill in debate then in the House of Lords? It is a strange thing that a man should be lawfully in the company of men, where he must needs hear and see what they say and do, and yet must not take notice of it so much as to the same company; for though the King was not present at the debate itself, yet it was lawful for any of the Lords to make him acquainted with it. Any one of the House of Commons, though not present at a proposition or debate in the House, nevertheless hearing of it from some of his fellow-members, may certainly not only take notice of it, but also speak to it in the House of Commons: but to make the King give up his friends and counsellors to them, to be put to death, banishment, or imprisonment, for their good-will to him, was such a tyranny over a king, no king ever exercised over any subject but in cases of treason or murder, and seldom then.

A.

Presently hereupon began a kind of war between the pens of the Parliament and those of the secretaries, and other able men that were with the King. For upon the 15th of December they sent to the King a paper called A Remonstrance of the State of the Kingdom, and with it a petition; both which they caused to be published. In the remonstrance they complained of certain mischievous designs of a malignant party, then, before the beginning of the Parliament, grown ripe; and did set forth what means had been used for the preventing of it by the wisdom of the Parliament; what rubs they had found therein; what course was fit to be taken for restoring and establishing the ancient honour, greatness, and safety, of the Crown and nation.

And first, of these designs the promoters and actors were, they said, Jesuited Papists:

Secondly, the bishops, and that part of the clergy that cherish formality as a support of their own ecclesiastical tyranny and usurpation:

Thirdly, counsellors and courtiers, that for private ends, they said, had engaged themselves to further the interests of some foreign princes.

B.

It may very well be, that some of the bishops, and also some of the court, may have, in pursuit of their private interest, done something indiscreetly, and perhaps wickedly. Therefore I pray you tell me in particular what their crimes were: for methinks the King should not have connived at anything against his own supreme authority.

A.

The Parliament were not very keen against them that were against the King; they made no doubt but all they did was by the King's command; but accused thereof the bishops, counsellors, and courtiers, as being a more mannerly way of accusing the King himself, and defaming him to his subjects. For the truth is, the charge they brought against them was so general as not to be called an accusation, but railing. As first, they said they nourished questions of prerogative and liberty between the King and his people, to the end that seeming much addicted to his Majesty's service, they might get themselves into places of greatest trust and power in the kingdom.

B.

How could this be called an accusation, in which there is no fact for any accusers to apply their proofs to, or their witnesses. For granting that these questions of prerogative had been moved by them, who can prove that their end was to gain to themselves and friends the places of trust and power in the kingdom?

A.

A second accusation was, that they endeavoured to suppress the purity and power of religion.

B.

That is canting; it is not in man's power to suppress the power of religion.

A.

They meant that they suppressed the doctrine of the Presbyterians; that is to say, the very foundation of the then Parliament's treacherous pretensions.

A third, that they cherished Arminians, Papists, and libertines (by which they meant the common Protestants, which meddle not with disputes), to the end they might compose a body fit to act according to their counsels and resolutions.

A fourth, that they endeavoured to put the King upon other courses of raising money, than by the ordinary way of Parliaments.

Judge whether these may be properly called accusations, or not rather spiteful reproaches of the King's government.

B.

Methinks this last was a very great fault. For what good could there be in putting the King upon an odd course of getting money, when the Parliament was willing to supply him, as far as to the security of the kingdom, or to the honour of the King, should be necessary?

A.

But I told you before, they would give him none, but with a condition he should cut off the heads of whom they pleased, how faithfully soever they had served him. And if he would have sacrificed all his friends to their ambition, yet they would have found other excuses for denying him subsidies; for they were resolved to take from him the sovereign power to themselves; which they could never do without taking great care that he should have no money at all. In the next place, they put into the remonstrance, as faults of them whose counsel the King followed, all those things which since the beginning of the King's reign were by them misliked, whether faults or not, and whereof they were not able to

judge for want of knowledge of the causes and motives that induced the King to do them, and were known only to the King himself and such of his privy-council as he revealed them to.

B.

But what were those particular pretended faults?

A.

The dissolution of his first Parliament at Oxford. 2. The dissolution of his second Parliament, being in the second year of his reign. 3. The dissolution of his Parliament in the fourth year of his reign. 4. The fruitless expedition against Calais. 5. The peace made with Spain, whereby the Palatine's cause was deserted, and left to chargeable and hopeless treaties. 6. The sending of commissions to raise money by way of loan. 7. Raising of ship-money. 8. Enlargement of forests, contrary to Magna Charta. 9. The design of engrossing all the gunpowder into one hand, and keeping it in the Tower of London. 10. A design to bring in the use of brass money. 11. The fines, imprisonments, stigmatizings, mutilations, whippings, pillories, gags, confinements, and banishments, by sentence in the Court of Star-chamber. 12. The displacing of judges. 13. Illegal acts of the Council-table. 14. The arbitrary and illegal power of the Earl Marshal's Court. 15. The abuses in Chancery, Exchequer-chamber, and Court of Wards. 16. The selling of titles of honour, of judges, and serjeants' places, and other offices. 17. The insolence of bishops and other clerks, in suspensions, excommunications, deprivations, and degradations, of divers painful, and learned, and pious ministers.

B.

Were there any such ministers degraded, deprived, or excommunicated?

A.

I cannot tell. But I remember I have heard threatened divers painful, unlearned, and seditious ministers.

18. The excess of severity of the High Commission-Court. 19. The preaching before the King against the property of the subject, and for the prerogative of the King above the law. And divers other petty quarrels they had to the government, which though they were laid upon this faction, yet they knew they would fall upon the King himself in the judgment of the people, to whom, by printing, it was communicated.

Again, after the dissolution of the Parliament May the 5th, 1640, they find other faults; as the dissolution itself; the imprisoning some members of both Houses; a forced loan of money attempted in London; the continuance of the Convocation, when the Parliament was ended; and the favour shewed to Papists by Secretary Windebank and others.

B.

All this will go current with common people for misgovernment, and for faults of the King, though some of them were misfortunes; and both the misfortunes and the misgovernment, if any were, were the faults of the Parliament; who, by denying to give him money, did both frustrate his attempts abroad, and put him upon those extraordinary ways, which they call illegal, of raising money at home.

A.

You see what a heap of evils they have raised to make a show of ill-government to the people, which they second with an enumeration of

the many services they have done the King in overcoming a great many of them, though not all, and in divers other things; and say, that though they had contracted a debt to the Scots of 220,000l. and granted six subsidies, and a bill of poll-money worth six subsidies more, yet that God had so blessed the endeavours of this Parliament, that the kingdom was a gainer by it: and then follows the catalogue of those good things they had done for the King and kingdom. For the kingdom they had done, they said, these things: they had abolished ship-money; they had taken away coat and conduct money, and other military charges, which, they said, amounted to little less than the ship-money; that they suppressed all monopolies, which they reckoned above a million yearly saved by the subject; that they had quelled living grievances, meaning evil counsellors and actors, by the death of my Lord of Strafford, by the flight of the Chancellor Finch, and of Secretary Windebank, by the imprisonment of the Archbishop of Canterbury, and of Judge Bartlet, and the impeachment of other bishops and judges; that they had passed a bill for a triennial Parliament, and another for the continuance of the present Parliament, till they should think fit to dissolve themselves.

B.

That is to say, for ever, if they be suffered. But the sum of all these things, which they had done for the kingdom, is, that they had left it without government, without strength, without money, without law, and without good counsel.

A.

They reckoned, also, putting down of the High-Commission, and the abating of the power of the Council-table, and of the bishops and their courts; the taking away of unnecessary ceremonies in religion;

removing of ministers from their livings, that were not of their faction, and putting in such as were.

B.

All this was but their own, and not the kingdom's business.

A.

The good they had done the King, was first, they said, the giving of 25,000l. a month for the relief of the northern counties.

B.

What need of relief had the northern counties, more than the rest of the counties of England?

A.

Yes; in the northern counties were quartered the Scotch army, which the Parliament called in to oppose the King, and consequently their quarter was to be discharged.

B.

True; but by the Parliament that called them in.

A.

But they say no; and that this money was given to the King, because he is bound to protect his subjects.

B.

He is no further bound to that, than they to give him money wherewithal to do it. This is very great impudence; to raise an army against the King, and with that army to oppress their fellow-subjects; and then require that the King should relieve them, that is to say, be at the charge of paying the army that was raised to fight against him.

A.

Nay, further; they put to the King's account the 300,000l. given to the Scots, without which they would not have invaded England; besides many other things, that I now remember not.

B.

I did not think there had been so great impudence and villainy in mankind.

A.

You have not observed the world long enough to see all that is ill. Such was their remonstrance, as I have told you. With it they sent a petition, containing three points: 1. That his Majesty would deprive the bishops of their votes in Parliament, and remove such oppressions in religion, church-government, and discipline, as they had brought in; 2. That he should remove from his council all such as should promote the people's grievances, and employ in his great and public affairs such as the Parliament should confide in; 3. That he would not give away the lands escheated to the Crown by the rebellion in Ireland.

B.

This last point, methinks, was not wisely put in at this time: it should have been reserved till they had subdued the rebels, against whom there were yet no forces sent over. It is like selling the lion's skin before they had killed him. But what answer was made to the other two propositions?

A.

What answer should be made, but a denial? About the same time the King himself exhibited articles against six persons of the Parliament, five whereof were of the House of Commons and one of the House of Lords, accusing them of high-treason; and upon the 4th of January, went himself to the House of Commons to demand those five of them. But private notice having been given by some treacherous person about the King, they had absented themselves; and by that means frustrated his Majesty's intentions. And after he was gone, the House making a heinous matter of it, and a high breach of their privileges, adjourned themselves into London, there to sit as a general committee, pretending they were not safe at Westminster: (for the King, when he went to the House to demand those persons, had somewhat more attendance with him, but not otherwise armed than his servants used to be, than he ordinarily had): and would not be pacified, though the King did afterwards waive the prosecution of those persons, unless he would also discover to them those that gave him counsel to go in that manner to the Parliament House, to the end they might receive condign punishment; which was the word they used instead of cruelty.

B.

This was a harsh demand. Was it not enough that the King should forbear his enemies, but also that he must betray his friends? If they thus

tyrannize over the King before they have gotten the sovereign power into their hands, how will they tyrannize over their fellow-subjects when they have gotten it?

A.

So as they did.

B.

How long stayed that committee in London?

A.

Not above two or three days; and then were brought from London to the Parliament House by water in great triumph, guarded with a tumultuous number of armed men, there to sit in security in despite of the King, and make traitorous acts against him, such and as many as they listed; and under favour of these tumults, to frighten away from the House of Peers all such as were not of their own faction. For at this time the rabble was so insolent, that scarce any of the bishops durst go to the House for fear of violence upon their persons: in so much as twelve of them excused themselves of coming thither; and by way of petition to the King, remonstrated that they were not permitted to go quietly to the performance of that duty, and protesting against all determinations, as of none effect, that should pass in the House of Lords during their forced absence. Which the House of Commons taking hold of, sent up to the Peers one of their members, to accuse them of high-treason. Whereupon ten of them were sent to the Tower; after which time there were no more words of their high-treason; but there passed a bill by which they were deprived of their votes in Parliament, and to this bill they got the King's

assent. And, in the beginning of September after, they voted that the bishops should have no more to do in the government of the Church; but to this they had not the King's assent, the war being now begun.

B.

What made the Parliament so averse to episcopacy; and especially the House of Lords, whereof the bishops were members? For I see no reason why they should do it to gratify a number of poor parish priests, that were Presbyterians, and that were never likely any way to serve the Lords; but, on the contrary, to do their best to pull down their power, and subject them to their synods and classes.

A.

For the Lords, very few of them did perceive the intentions of the Presbyterians; and, besides that, they durst not, I believe, oppose the Lower House.

B.

But why were the Lower House so earnest against them?

A.

Because they meant to make use of their tenets, and with pretended sanctity to make the King and his party odious to the people, by whose help they were to set up democracy and depose the King, or to let him have the title only so long as he should act for their purposes. But not only the Parliament, but in a manner all the people of England, were their enemies, upon the account of their behaviour, as being, they said, too imperious. This was all that was colourably laid to their charge; the

main cause of pulling them down, was the envy of the Presbyterians, that incensed the people against them, and against episcopacy itself.

B.

How would the Presbyterians have the Church to be governed?

A.

By national and provincial synods.

B.

Is not this to make the national assembly an archbishop, and the provincial assemblies so many bishops?

A.

Yes; but every minister shall have the delight of sharing the government, and consequently of being able to be revenged on them that do not admire their learning and help to fill their purses, and win to their service them that do.

B.

It is a hard case, that there should be two factions to trouble the commonwealth, without any interest in it of their own, other than every particular man may have; and that their quarrels should be only about opinions, that is, about who has the most learning; as if their learning ought to be the rule of governing all the world. What is it they are learned in? Is it politics and rules of state? I know, it is called divinity; but I hear almost nothing preached but matter of philosophy. For

religion in itself admits no controversy. It is a law of the kingdom, and ought not to be disputed. I do not think they pretend to speak with God and know his will by any other way than reading the Scriptures, which we also do.

A.

Yes, some of them do, and give themselves out for prophets by extraordinary inspiration. But the rest pretend only, for their advancement to benefices and charge of souls, a greater skill in the Scriptures than other men have, by reason of their breeding in the Universities, and knowledge there gotten of the Latin tongue, and some also of the Greek and Hebrew tongues, wherein the Scripture was written; besides their knowledge of natural philosophy, which is there publicly taught.

B.

As for the Latin, Greek, and Hebrew tongues, it was once, to the detection of Roman fraud, and to the ejection of the Romish power, very profitable, or rather necessary; but now that is done, and we have the Scripture in English, and preaching in English, I see no great need of Latin, Greek, and Hebrew. I should think myself better qualified by understanding well the languages of our neighbours, French, Dutch, and Italian. I think it was never seen in the world, before the power of popes was set up, that philosophy was much conducing to power in a commonwealth.

B.

But philosophy, together with divinity, have very much conduced to the advancement of the professors thereof to places of the greatest authority, next to the authority of kings themselves, in most of the ancient kingdoms of the world; as is manifestly to be seen in the history of those times.

B.

I pray you cite me some of the authors and places.

A.

First, what were the Druids of old time in Britanny and France? What authority these had you may see in Cæsar, Strabo, and others, and especially in Diodorus Siculus, the greatest antiquary perhaps that ever was; who speaking of the Druids, whom he calls Sarovides, in France, says thus:— “There be also amongst them certain philosophers and theologians, that are exceedingly honoured, whom they also use as prophets. These men, by their skill in augury and inspection into the bowels of the beasts sacrificed, foretell what is to come, and have the multitude obedient to them.” And a little after,— “It is a custom amongst them, that no man may sacrifice without a philosopher; because, say they, men ought not to present their thanks to the Gods, but by them that know the divine nature, and are as it were of the same language with them; and that all good things ought by such as these to be prayed for.”

B.

I can hardly believe that those Druids were very skilful, either in natural philosophy, or moral.

A.

Nor I; for they held and taught the transmigration of souls from one body to another, as did Pythagoras; which opinion whether they took from him, or he from them, I cannot tell.

What were the Magi in Persia, but philosophers and astrologers? You know how they came to find our Saviour by the conduct of a star, either from Persia itself, or from some country more eastward than Judea. Were not these in great authority in their country? And are they not in most parts of Christendom thought to have been Kings?

Egypt hath been thought by many, the most ancient kingdom and nation of the world, and their priests had the greatest power in civil affairs, that any subjects ever had in any nation. And what were they but philosophers and divines? Concerning whom, the same Diodorus Siculus says thus: "The whole country of Egypt being divided into three parts, the body of the priests have one, as being of most credit with the people both for their devotion towards the Gods, and also for their understanding gotten by education;" and presently after, "For generally these men, in the greatest affairs of all, are the King's counsellors, partly executing, and partly informing and advising; foretelling him also, by their skill in astrology and art in the inspection of sacrifices, the things that are to come, and reading to him out of their holy books such of the actions there recorded as are profitable for him to know. It is not there as in Greece, one man or one woman that has the priesthood; but they are many that attend the honours and sacrifices of the Gods, and leave the same employment to their posterity, which, next to the King, have the greatest power and authority."

Concerning the judicature amongst the Egyptians, he saith thus: "From out of the most eminent cities, Hieropolis, Thebes, and Memphis, they choose judges, which are a council not inferior to that of Areopagus in

Athens, or that of the senate in Lacedæmon. When they are met, being in number thirty, they choose one from amongst themselves to be chief-justice, and the city whereof he is, sendeth another in his place.” This chief-justice wore about his neck, hung in a gold chain, a jewel of precious stones, the name of which jewel was truth; which, when the chief-justice had put on, then began the pleading, &c.; and when the judges had agreed on the sentence, then did the chief-justice put this jewel of truth to one of the pleas. You see now what power was acquired in civil matters by the conjuncture of philosophy and divinity.

Let us come now to the commonwealth of the Jews. Was not the priesthood in a family, namely, the Levites, as well as the priesthood of Egypt? Did not the high-priest give judgment by the breast-plate of Urim and Thummim? Look upon the kingdom of Assyria, and the philosophers and Chaldeans. Had they not lands and cities belonging to their family, even in Abraham’s time, who dwelt, you know, in Ur of the Chaldeans. Of these the same author says thus: “The Chaldeans are a sect in politics, like to that of the Egyptian priests; for being ordained for the service of the Gods, they spend the whole time of their life in philosophy; being of exceeding great reputation in astrology, and pretending much also to prophecy, foretelling things to come by purifications and sacrifices, and to find out by certain incantations the preventing of harm, and the bringing to pass of good. They have also skill in augury, and in the interpretation of dreams and wonders, nor are they unskilful in the art of foretelling by the inwards of beasts sacrificed; and have their learning not as the Greeks; for the philosophy of the Chaldeans goes to their family by tradition, and the son receives it from his father.”

From Assyria let us pass into India, and see what esteem the philosophers had there. “The whole multitude,” says Diodorus, “of the

Indians, is divided into seven parts; whereof the first, is the body of philosophers; for number the least, but for eminence the first; for they are free from taxes, and as they are not masters of others, so are no others masters of them. By private men they are called to the sacrifices and to the care of burials of the dead, as being thought most beloved of the Gods and skilful in the doctrine concerning hell; and for this employment receive gifts and honours very considerable. They are also of great use to the people of India; for being taken at the beginning of the year into the great assembly, they foretell them of great droughts, great rains, also of winds, and of sicknesses, and of whatsoever is profitable for them to know beforehand.”

The same author, concerning the laws of the Æthiopians, saith thus: “The laws of the Æthiopians seem very different from those of other nations, and especially about the election of their Kings. For the priests propound some of the chief men amongst them, named in a catalogue, and whom the God (which, according to a certain custom, is carried about to feastings) does accept of; him the multitude elect for their King, and presently adore and honour him as a God, put into the government by divine providence. The King being chosen, he has the manner of his life limited to him by the laws, and does all other things according to the custom of the country, neither rewarding nor punishing any man otherwise than from the beginning is established amongst them by law. Nor use they to put any man to death, though he be condemned to it, but to send some officer to him with a token of death; who seeing the token, goes presently to his house, and kills himself presently after. But the strangest thing of all is, that which they do concerning the death of their Kings. For the priests that live in Meroe, and spend their time about the worship and honour of the Gods, and are in greatest authority; when they have a mind to it, send a messenger to the King to bid him

die, for that the Gods have given such order, and that the commandments of the immortals are not by any means to be neglected by those who are, by nature, mortal; using also other speeches to him, which men of simple judgment, and that have not reason enough to dispute against those unnecessary commands, as being educated in an old and indelible custom, are content to admit of. Therefore in former times the Kings did obey the priests, not as mastered by force and arms, but as having their reason mastered by superstition. But in the time of Ptolemy II, Ergamenes, King of the Æthiopians, having had his breeding in philosophy after the manner of the Greeks, being the first that durst dispute their power, took heart as befitted a King; came with soldiers to a place called Abaton, where was then the golden temple of the Æthiopians; killed all the priests, abolished the custom, and rectified the kingdom according to his will.”

B.

Though they that were killed were most damnable impostors, yet the act was cruel.

A.

It was so. But were not the priests cruel, to cause their Kings, whom a little before they adored as Gods, to make away themselves? The King killed them, for the safety of his person; they him, out of ambition or love of change. The King’s act may be coloured with the good of his people; the priests had no pretence against their kings, who were certainly very godly, or else would never have obeyed the command of the priests by a messenger unarmed, to kill themselves. Our late King, the best King perhaps that ever was, you know, was murdered, having been first persecuted by war, at the incitement of Presbyterian ministers;

who are therefore guilty of the death of all that fell in that war; which were, I believe, in England, Scotland, and Ireland, near 100,000 persons. Had it not been much better that those seditious ministers, which were not perhaps 1000, had been all killed before they had preached? It had been, I confess, a great massacre; but the killing of 100,000 is a greater.

B.

I am glad the bishops were out of this business. As ambitious as some say they are, it did not appear in that business, for they were enemies to them that were in it.

A.

But I intend not by these quotations to commend either the divinity or the philosophy of those heathen people; but to show only what the reputation of those sciences can effect among the people. For their divinity was nothing but idolatry; and their philosophy, (excepting the knowledge which the Egyptian priests, and from them the Chaldeans, had gotten by long observation and study in astronomy, geometry, and arithmetic), very little; and that in great part abused in astrology and fortunetelling. Whereas the divinity of the clergy of this nation, (considered apart from the mixture that has been introduced by the Church of Rome, and in part retained here, of the babbling philosophy of Aristotle and other Greeks, that has no affinity with religion, and serves only to breed disaffection, dissension, and finally sedition and civil war, as we have lately found by dear experience in the differences between the Presbyterians and Episcopalians), is the true religion. But for these differences both parties, as they came in power, not only suppressed the tenets of one another, but also whatsoever doctrine

looked with an ill aspect upon their interest; and consequently all true philosophy, especially civil and moral, which can never appear propitious to ambition, or to an exemption from their obedience due to the sovereign power.

After the King had accused the Lord Kimbolton, a member of the House of Lords, and Hollis, Haslerigg, Hampden, Pym, and Stroud, five members of the Lower House, of high-treason; and after the Parliament had voted out the bishops from the House of Peers; they pursued especially two things in their petitions to his Majesty. The one was, that the King would declare who were the persons that advised him to go, as he did, to the Parliament-house to apprehend them, and that he would leave them to the Parliament to receive condign punishment; and this they did, to stick upon his Majesty the dishonour of deserting his friends, and betraying them to his enemies. The other was, that he would allow them a guard out of the city of London, to be commanded by the Earl of Essex; for which they pretended, they could not else sit in safety; which pretence was nothing but an upbraiding of his Majesty for coming to Parliament better accompanied than ordinary, to seize the said five seditious members.

B.

I see no reason, in petitioning for a guard, they should determine it to the city of London in particular, and the command by name to the Earl of Essex, unless they meant the King should understand it for a guard against himself.

A.

Their meaning was, that the King should understand it so, and, as I verily believe, they meant he should take it for an affront: and the King

himself understanding it so, denied to grant it; though he were willing, if they could not otherwise be satisfied, to command such a guard to wait upon them as he would be responsible for to God Almighty. Besides this, the city of London petitioned the King (put upon it, no doubt, by some members of the Lower House) to put the Tower of London into the hands of persons of trust, meaning such as the Parliament should approve of, and to appoint a guard for the safety of his Majesty and the Parliament. This method of bringing petitions in a tumultuary manner, by great multitudes of clamorous people, was ordinary with the House of Commons, whose ambition could never have been served by way of prayer and request, without extraordinary terror.

After the King had waived the prosecution of the five members, but denied to make known who had advised him to come in person to the House of Commons, they questioned the Attorney-General, who by the King's command had exhibited the articles against them, and voted him a breaker of the privilege of Parliament; and no doubt had made him feel their cruelty, if he had not speedily fled the land.

About the end of January, they made an order of both Houses of Parliament, to prevent the going over of popish commanders into Ireland; not so much fearing that, as that by this the King himself choosing his commanders for that service, might aid himself out of Ireland against the Parliament. But this was no great matter, in respect of a petition they sent his Majesty about the same time, that is to say, about the 27th or 28th of January, 1641, wherein they desired in effect the absolute sovereignty of England; though by the name of sovereignty they challenged it not whilst the King was living. For to the end that the fears and dangers of this kingdom might be removed, and the mischievous designs of those who are enemies to the peace of it, might be prevented, they pray, that his Majesty would be pleased to put

forthwith, first, the Tower of London, second, all other forts, third, the whole militia of the kingdom, into the hands of such persons as should be recommended to him by both the Houses of Parliament. And this they style a necessary petition.

B.

Were there really any such fears and dangers generally conceived here? Or did there appear any enemies at that time with such designs as are mentioned in the petition?

A.

Yes. But no other fear of danger, but such as any discreet and honest man might justly have of the designs of the Parliament itself; who were the greatest enemies to the peace of the kingdom that could possibly be. It is also worth observing, that this petition began with these words, Most gracious Sovereign: so stupid they were as not to know, that he that is master of the militia, is master of the kingdom, and consequently is in possession of a most absolute sovereignty. The King was now at Windsor, to avoid the tumults of the common people before the gates of Whitehall, together with their clamours and affronts there. The 9th of February after, he came to Hampton Court, and thence he went to Dover with the Queen, and the Princess of Orange, his daughter; where the Queen with the Princess of Orange embarked for Holland, but the King returned to Greenwich, whence he sent for the Prince of Wales and the Duke of York, and so went with them towards York.

B.

Did the Lords join with the Commons in this petition for the militia?

A.

It appears so by the title; but I believe they durst not but do it. The House of Commons took them but for a cypher; men of title only, without real power. Perhaps also the most of them thought, that the taking of the militia from the King would be an addition to their own power; but they were very much mistaken, for the House of Commons never intended they should be sharers in it.

B.

What answer made the King to this petition?

A.

The following: “His Majesty having well considered of this petition, and being desirous to express how willing he is to apply a remedy, not only to your dangers, but even to your doubts and fears, he therefore returns this answer, That when he shall know the extent of power which is intended to be established in those persons, whom you desire to be the commanders of the militia in the several counties, and likewise to what time it shall be limited, that no power shall be executed by his Majesty alone without the advice of Parliament, then he will declare, that (for the securing you from all dangers or jealousies of any) his Majesty will be content to put in all the places, both of forts and militia in the several counties, such persons as both the Houses of Parliament shall either approve, or recommend unto him; so that you declare before unto his Majesty the names of the persons whom you approve or recommend, unless such persons shall be named, against whom he shall have just and unquestionable exception.”

B.

What power, for what time, and to whom, did the Parliament grant, concerning the militia?

A.

The same power which the King had before planted in his lieutenants and deputy-lieutenants, in the several counties, and without other limitation of time but their own pleasure.

B.

Who were the men that had this power?

A.

There is a catalogue of them printed. They are very many, and most of them lords; nor is it necessary to have them named; for to name them is, in my opinion, to brand them with the mark of disloyalty or of folly. When they had made a catalogue of them, they sent it to the King, with a new petition for the militia. Also presently after, they sent a message to his Majesty, praying him to leave the Prince at Hampton Court; but the King granted neither.

B.

Howsoever, it was well done of them to get hostages, if they could, of the King, before he went from them.

A.

In the meantime, to raise money for the reducing of Ireland, the Parliament invited men to bring in money by way of adventure, according to these propositions. 1. That two millions and five hundred thousand acres of land in Ireland, should be assigned to the adventurers, in this proportion: For an adventure of 200l. 1,000 acres in Ulster..

. . . . 300l. 1,000 acres in Connaught..

. . . . 450l. 1,000 acres in Munster..

. . . . 600l. 1,000 acres in Leinster. All according to English measure, and consisting of meadow, arable, and profitable pasture; bogs, woods, and barren mountains, being cast in over and above. 2. A revenue was reserved to the Crown, from one penny to three-pence on every acre. 3. That commissions should be sent by the Parliament, to erect manors, settle wastes, and commons, maintain preaching ministers, create corporations, and regulate plantations. The rest of the propositions concern only the times and manner of payment of the sums subscribed by the adventurers. And to these propositions his Majesty assented; but to the petition of the militia, his Majesty denied his assent.

B.

If he had not, I should have thought it a great wonder. What did the Parliament after this?

A.

They sent him another petition, which was presented to him when he was at Theobald's, in his way to York; wherein they tell him plainly, that unless he be pleased to assure them by those messengers then sent, that he would speedily apply his royal assent to the satisfaction of their former desires, they shall be enforced, for the safety of his Majesty and his kingdoms, to dispose of the militia by the authority of both Houses,

&c. They petition his Majesty also to let the Prince stay at St. James's, or some other of his Majesty's houses near London. They tell him also, that the power of raising, ordering, and disposing of the militia, cannot be granted to any corporation, without the authority and consent of the Parliament, and that those parts of the kingdom, which have put themselves into a posture of defence, have done nothing therein but by direction of both Houses, and what is justifiable by the laws of this kingdom.

B.

What answer made the King to this?

A.

It was a putting of themselves into arms, and under officers such as the Parliament should approve of. 4. They voted that his Majesty should be again desired that the Prince might continue about London. Lastly, they voted a declaration to be sent to his Majesty by both the Houses; wherein they accuse his Majesty of a design of altering religion, though not directly him, but them that counselled him; whom they also accused of being the inviters and fomenters of the Scotch war, and framers of the rebellion in Ireland; and upbraid the King again for accusing the Lord Kimbolton and the five members, and of being privy to the purpose of bringing up his army, which was raised against the Scots, to be employed against the Parliament. To which his Majesty sent his answer from Newmarket. Whereupon it was resolved by both Houses, that in this case of extreme danger and of his Majesty's refusal, the ordinance agreed upon by both Houses for the militia doth oblige the people by the fundamental laws of this kingdom; and also, that whosoever shall execute any power over the militia, by colour of any commission of

lieutenancy, without consent of both Houses of Parliament, shall be accounted a disturber of the peace of the kingdom. Whereupon his Majesty sent a message to both Houses from Huntingdon, requiring obedience to the laws established, and prohibiting all subjects, upon pretence of their ordinance, to execute anything concerning the militia which is not by those laws warranted. Upon this, the Parliament vote a standing to their former votes; as also, that when the Lords and Commons in Parliament, which is the supreme court of judicature in the kingdom, shall declare what the law of the land is, to have this not only questioned, but contradicted, is a high breach of the privilege of Parliament.

B.

I thought that he that makes the law, ought to declare what the law is. For what is it else to to make a law, but to declare what it is? So that they have taken from the King, not only the militia, but also the legislative power.

A.

They have so; but I make account that the legislative power, and indeed all power possible, is contained in the power of the militia. After this, they seize such money as was due to his Majesty upon the bill of tonnage and poundage, and upon the bill of subsidies, that they might disable him every way they possibly could. They sent him also many other contumelious messages and petitions after his coming to York; amongst which one was: "That whereas the Lord Admiral, by indisposition of body, could not command the fleet in person, he would be pleased to give authority to the Earl of Warwick to supply his place;" when they knew the King had put Sir John Pennington in it before.

B.

To what end did the King entertain so many petitions, messages, declarations and remonstrances, and vouchsafe his answers to them, when he could not choose but clearly see they were resolved to take from him his royal power, and consequently his life? For it could not stand with their safety to let either him or his issue live, after they had done him so great injuries.

A.

Besides this, the Parliament had at the same time a committee residing at York, to spy what his Majesty did, and to inform the Parliament thereof, and also to hinder the King from gaining the people of that county to his party: so that when his Majesty was courting the gentlemen there, the committee was instigating the yeomanry against him. To which also the ministers did very much contribute; so that the King lost his opportunity at York.

B.

Why did not the King seize the committee into his hands, or drive them out of town?

A.

I know not; but I believe he knew the Parliament had a greater party than he, not only in Yorkshire but also in York. Towards the end of April, the King, upon petition of the people of Yorkshire to have the magazine of Hull to remain still there, for the greater security of the northern parts, thought fit to take it into his own hands. He had a little

before appointed governor of that town the Earl of Newcastle. But the townsmen, having been already corrupted by the Parliament, refused to receive him, but refused not to receive Sir John Hotham, appointed to be governor by the Parliament. The King therefore coming before the town, guarded only by his own servants and a few gentlemen of the country thereabouts, was denied entrance by Sir John Hotham, that stood upon the wall; for which act he presently caused Sir John Hotham to be proclaimed traitor, and sent a message to the Parliament, requiring justice to be done upon the said Hotham, and that the town and magazine might be delivered into his hands. To which the Parliament made no answer, but instead thereof published another declaration, in which they omitted nothing of their former slanders against his Majesty's government, but inserted certain propositions declarative of their own pretended right: viz. 1. That whatsoever they declare to be law, ought not to be questioned by the King: 2. That no precedents can be limits to bound their proceedings: 3. That a Parliament, for the public good, may dispose of anything wherein the King or subject hath a right; and that they, without the King, are this Parliament, and the judge of this public good, and that the King's consent is not necessary: 4. That no member of either House ought to be troubled for treason, felony, or any other crime, unless the cause be first brought before the Parliament, that they may judge of the fact and give leave to proceed, if they see cause: 5. That the sovereign power resides in both Houses, and that the King ought to have no negative voice: 6. That the levying of forces against the personal commands of the King (though accompanied with his presence) is not levying war against the King, but the levying war against his laws and authority (which they have power to declare and signify), though not against his person, is levying war against the King; and that treason cannot be committed against his person, otherwise than

as he is entrusted with the kingdom and discharging that trust; and that they have a power to judge whether he discharge this trust or not: 7. That they may depose the King when they will.

B.

This is plain dealing and without hypocrisy. Could the city of London swallow this?

A.

Yes; and more too, if need be. London, you know, has a great belly, but no palate nor taste of right and wrong. In the Parliament-roll of HenryIV, amongst the articles of the oath the King at his coronation took, there is one runs thus: *Concedes justas leges et consuetudines esse tenendas; et promittes per te eas esse protegendas, et ad honorem Dei corroborandas, quas vulgus elegerit.* Which the Parliament urged for their legislative authority, and therefore interpret *quas vulgus elegeret*, which the people shall choose; as if the King should swear to protect and corroborate laws before they were made, whether they be good or bad; whereas the words signify no more, but that he shall protect and corroborate such laws as they have chosen, that is to say, the Acts of Parliament then in being. And in the records of the Exchequer it is thus: *Will you grant to hold and keep the laws and rightful customs which the commonalty of this your kingdom have, and will you defend and uphold them? &c.* And this was the answer his Majesty made to that point.

B.

And I think this answer very full and clear. But if the words were to be interpreted in the other sense, yet I see no reason why the King should

be bound to swear to them. For Henry IV came to the Crown by the votes of a Parliament not much inferior in wickedness to this Long Parliament, that deposed and murdered their lawful King; saving that it was not the Parliament itself, but the usurper that murdered King Richard II.

A.

About a week after, in the beginning of May, the Parliament sent the King another paper, which they styled the humble petition and advice of both Houses, containing nineteen propositions; which when you shall hear, you shall be able to judge what power they meant to leave to the King more than to any one of his subjects. The first of them is this:

That the Lords and others of his Majesty's privy-council, and all great officers of state, both at home and abroad, be put from their employments and from his council, save only such as should be approved of by both Houses of Parliament; and none put into their places but by approbation of the said Houses. And that all privy-councillors take an oath for the due execution of their places, in such form as shall be agreed upon by the said Houses.

That the great affairs of the kingdom be debated, resolved, and transacted only in Parliament; and such as shall presume to do any thing to the contrary, be reserved to the censure of the Parliament; and such other matters of the state as are proper for his Majesty's privy-council, shall be debated and concluded by such as shall from time to time be chosen for that place by both Houses of Parliament; and that no public act concerning the affairs of the kingdom, which is proper for his Majesty's privy-council, be esteemed valid, as proceeding from the royal authority, unless it be done by the advice and consent of the major part of the council, attested under their hands; and that the council be

not more than twenty-five, nor less than fifteen; and that when a councillor's place falls void in the interval of Parliament, it shall not be supplied without the assent of the major part of the council; and that such choice also shall be void, if the next Parliament after confirm it not.

That the Lord High Steward of England, Lord High Constable, Lord Chancellor, or Lord Keeper of the Great Seal, Lord Treasurer, Lord Privy-Seal, Earl Marshal, Lord Admiral, Warden of the Cinque Ports, Chief Governor of Ireland, Chancellor of the Exchequer, Master of the Wards, Secretaries of State, two Chief Justices and Chief Baron, be always chosen with the approbation of both Houses of Parliament; and in the intervals of Parliament, by the major part of the privy-council.

That the government of the King's children shall be committed to such as both Houses shall approve of; and in the intervals of Parliament, such as the privy-council shall approve of; that the servants then about them, against whom the Houses have just exception, should be removed.

That no marriage be concluded or treated of for any of the King's children, without consent of Parliament.

That the laws in force against Jesuits, priests, and popish recusants, be strictly put in execution.

That the votes of Popish lords in the House of Peers be taken away, and that a bill be passed for the education of the children of Papists in the Protestant religion.

That the King will be pleased to reform the Church-government and liturgy in such manner as both Houses of Parliament shall advise.

That he would be pleased to rest satisfied with that course that the Lords and Commons have appointed for ordering the militia, and recal his declarations and proclamations against it.

That such members as have been put out of any place or office since this Parliament began, may be restored, or have satisfaction.

That all privy-councillors and judges take an oath, (the form whereof shall be agreed on and settled by act of Parliament), for the maintaining of the Petition of Right, and of certain statutes made by the Parliament.

That all the judges and officers placed by approbation of both Houses of Parliament, may hold their places *quam diu bene se gesserint*.

That the justice of Parliament may pass upon all delinquents, whether they be within the kingdom or fled out of it; and that all persons cited by either House of Parliament, may appear and abide the censure of Parliament.

That the general pardon offered by his Majesty, be granted with such exceptions as shall be advised by both Houses of Parliament.

B.

What a spiteful article was this! All the rest proceeded from ambition, which many times well-natured men are subject to; but this proceeded from an inhuman and devilish cruelty.

A.

That the forts and castles be put under the command of such persons as, with the approbation of the Parliament, the King shall appoint.

That the extraordinary guards about the King be discharged; and for the future none raised but according to the law, in case of actual rebellion or invasion.

B.

Methinks these very propositions sent to the King are an actual rebellion.

A.

That his Majesty enter into a more strict alliance with the United Provinces, and other neighbour Protestant Princes and States.

That his Majesty be pleased, by act of Parliament, to clear the Lord Kimbolton and the five members of the House of Commons, in such manner as that future Parliaments may be secured from the consequence of that evil precedent.

That his Majesty be pleased to pass a bill for restraining peers made hereafter from sitting or voting in Parliament, unless they be admitted with consent of both Houses of Parliament.

These propositions granted, they promise to apply themselves to regulate his Majesty's revenue to his best advantage, and to settle it to the support of his royal dignity in honour and plenty; and also to put the town of Hull into such hands as his Majesty shall appoint with consent of Parliament.

B.

Is not that to put it into such hands as his Majesty shall appoint by the consent of the petitioners, which is no more than to keep it in their hands as it is? Did they want, or think the King wanted, common-sense, so as not to perceive that their promise herein was worth nothing?

A.

After the sending of these propositions to the King, and his Majesty's refusal to grant them, they began, on both sides, to prepare for war. The

King raised a guard for his person in Yorkshire, and the Parliament, thereupon having voted that the King intended to make war upon his Parliament, gave order for the mustering and exercising the people in arms, and published propositions to invite and encourage them to bring in either ready money or plate, or to promise under their hands to furnish and maintain certain numbers of horse, horsemen, and arms, for the defence of the King and Parliament, (meaning by King, as they had formerly declared, not his person, but his laws); promising to repay their money with interest of 8l. in the 100l. and the value of their plate with twelve-pence the ounce for the fashion. On the other side, the King came to Nottingham, and there did set up his standard royal, and sent out commissions of array to call those to him, which by the ancient laws of England were bound to serve him in the wars. Upon this occasion there passed divers declarations between the King and Parliament concerning the legality of this array, which are too long to tell you at this time.

B.

Nor do I desire to hear any mooting about this question. For I think that general law of *salus populi*, and the right of defending himself against those that had taken from him the sovereign power, are sufficient to make legal whatsoever he should do in order to the recovery of his kingdom, or to the punishing of the rebels.

A.

In the meantime the Parliament raised an army, and made the Earl of Essex general thereof; by which act they declared what they meant formerly, when they petitioned the King for a guard to be commanded by the said Earl of Essex. And now the King sends out his

proclamations, forbidding obedience to the orders of the Parliament concerning the militia; and the Parliament send out orders against the execution of the commissions of array. Hitherto, though it were a war before, yet there was no blood shed; they shot at one another nothing but paper.

B.

I understand now, how the Parliament destroyed the peace of the kingdom; and how easily, by the help of seditious Presbyterian ministers and of ambitious ignorant orators, they reduced this government into anarchy. But I believe it will be a harder task for them to bring in peace again, and settle the government, either in themselves, or any other governor, or form of government. For, granting that they obtained the victory in this war, they must be beholden for it to the valour, good conduct, or felicity of those to whom they give the command of their armies; especially to the general, whose good success will, without doubt, draw with it the love and admiration of the soldiers; so that it will be in his power, either to take the government upon himself, or to place it where himself thinks good. In which case, if he take it not to himself, he will be thought a fool; and if he do, he shall be sure to have the envy of his subordinate commanders, who look for a share either in the present government, or in the succession to it. For they will say: “Has he obtained his power by his own, without our danger, valour, and counsel; and must we be his slaves, whom we have thus raised? Or, is not there as much justice on our side against him, as was on his side against the King?”

A.

They will, and did; insomuch, that it was the reason why Cromwell, after he had gotten into his own hands the absolute power of England, Scotland, and Ireland, by the name of Protector, did never dare to take upon him the title of King, nor was ever able to settle it upon his children. His officers would not suffer it, as pretending after his death to succeed him; nor would the army consent to it, because he had ever declared to them against the government of a single person.

B.

But to return to the King. What means had he to pay, what provision had he to arm, nay, means to levy, an army able to resist the army of the Parliament, maintained by the great purse of the city of London and contributions of almost all the towns corporate in England, and furnished with arms as fully as they could require?

A.

It is true, the King had great disadvantages, and yet by little and little he got a considerable army, with which he so prospered as to grow stronger every day, and the Parliament weaker, till they had gotten the Scotch with an army of 21,000 men to come into England to their assistance. But to enter into the particular narration of what was done in the war, I have not now time.

B.

Well then, we will talk of that at next meeting.

PART III.

B.

We left at the preparations on both sides for war; which when I considered by myself, I was mightily puzzled to find out what possibility there was for the King to equal the Parliament in such a course, and what hopes he had of money, men, arms, fortified places, shipping, counsel, and military officers, sufficient for such an enterprise against the Parliament, that had men and money as much at command, as the city of London, and other corporation towns, were able to furnish, which was more than they needed. And for the men they should set forth for soldiers, they were almost all of them spitefully bent against the King and his whole party, whom they took to be either papists, or flatterers of the King, or that had designed to raise their fortunes by the plunder of the city and other corporation towns. And though I believe not that they were more valiant than other men, nor that they had so much experience in the war as to be accounted good soldiers; yet they had that in them, which in time of battle is more conducing to victory than valour and experience both together; and that was spite.

And for arms, they had in their hands the chief magazines, the Tower of London, and the town of Kingston-upon-Hull; besides most of the powder and shot that lay in several towns for the use of the trained bands.

Fortified places, there were not many then in England, and most of them in the hands of the Parliament.

The King's fleet was wholly in their command, under the Earl of Warwick.

Counsellors, they needed no more than such as were of their own body. So that the King was every way inferior to them, except it were, perhaps, in officers.

A.

I cannot compare their chief officers. For the Parliament, the Earl of Essex, after the Parliament had voted the war, was made general of all their forces both in England and Ireland, from whom all other commanders were to receive their commissions.

B.

What moved them to make general the Earl of Essex? And for what cause was the Earl of Essex so displeased with the King, as to accept that office?

A.

I do not certainly know what to answer to either of those questions; but the Earl of Essex had been in the wars abroad, and wanted neither experience, judgment, nor courage, to perform such an undertaking. And besides that, you have heard, I believe, how great a darling of the people his father had been before him, and what honour he had gotten by the success of his enterprise upon Calais, and in some other military actions. To which I may add, that this Earl himself was not held by the people to be so great a favourite at court as that they might not trust him with their army against the King. And by this, you may perhaps

conjecture the cause for which the Parliament made choice of him for general.

B.

But why did they think him discontented with the Court?

A.

I know not that; nor indeed that he was so. He came to the court, as other noblemen did, when occasion was, to wait upon the King; but had no office, till a little before this time, to oblige him to be there continually. But I believe verily, that the unfortunateness of his marriages, had so discountenanced his conversation with the ladies, that the court could not be his proper element, unless he had had some extraordinary favour there to balance that calamity. But for some particular discontent from the King, or intention of revenge for any supposed disgrace, I think he had none, nor that he was any ways addicted to Presbyterian doctrines, or other fanatic tenets in Church or State; saving only that he was carried away with the stream, in a manner, of the whole nation, to think that England was not an absolute, but a mixed monarchy; not considering that the supreme power must always be absolute, whether it be in the King or in the Parliament.

B.

Who was the general of the King's army?

A.

None yet but himself; nor indeed had he yet any army. But there coming to him at that time his two nephews, the Princes Rupert and Maurice, he

put the command of his horse into the hands of Prince Rupert, a man than whom no man living has a better courage, nor was more active and diligent in prosecuting his commissions; and, though but a young man then, was not without experience in the conducting of soldiers, as having been an actor in part of his father's wars in Germany.

B.

But how could the King find money to pay such an army as was necessary for him against the Parliament?

A.

Neither the King nor Parliament had much money at that time in their own hands, but were fain to rely upon the benevolence of those that took their parts. Wherein, I confess, the Parliament had a mighty great advantage. Those that helped the King in that kind, were only lords and gentlemen, which, not approving the proceedings of the Parliament, were willing to undertake the payment, every one, of a certain number of horse; which cannot be thought any very great assistance, the persons that payed them being so few. For other moneys that the King then had, I have not heard of any, but what he borrowed upon jewels in the Low Countries. Whereas the Parliament had a very plentiful contribution, not only from London, but generally from their faction in all other places of England, upon certain propositions, published by the Lords and Commons in June 1642, (at what time they had newly voted that the King intended to make war upon them), for bringing in of money or plate to maintain horse and horsemen, and to buy arms for the preservation of the public peace, and for the defence of the King and both Houses of Parliament; for the re-payment of which money and plate, they were to have the public faith.

B.

What public faith is there, when there is no public? What is it that can be called public, in a civil war, without the King?

A.

The truth is, the security was nothing worth, but served well enough to gull those seditious blockheads, that were more fond of change than either of their peace or profit.

Having by this means gotten contributions from those that were well-affected to their cause, they made use of it afterwards to force the like contribution from others. For in November following, they made an ordinance for assessing also of those that had not contributed then, or had contributed, but not proportionably to their estates. And yet this was contrary to what the Parliament promised and declared in the propositions themselves. For they declared, in the first proposition, that no man's affections should be measured by the proportion of his offer, so that he expressed his good will to the service in any proportion whatsoever.

Besides this, in the beginning of March following, they made an ordinance, to levy weekly a great sum of money upon every county, city, town, place, and person of any estate almost, in England; which weekly sum, as may appear by the ordinance itself, printed and published in March 1642 by order of both Houses, comes to almost 33,000*l.*, and consequently to above 1,700,000*l.* for the year. They had, besides all this, the profits of the King's lands and woods, and whatsoever was remaining unpaid of any subsidy formerly granted him, and the tonnage and poundage usually received by the King; besides the profit of the sequestrations of great persons, whom they pleased to vote delinquents,

and the profits of the bishops' lands, which they took to themselves a year, or a little more, after.

B.

Seeing then the Parliament had such advantage of the King in money and arms and multitude of men, and had in their hands the King's fleet, I cannot imagine what hope the King could have, either of victory (unless he resigned into their hands the sovereignty), or subsisting. For I cannot well believe he had any advantage of them either in counsellors, conductors, or in the resolutions of his soldiers.

A.

On the contrary, I think he had also some disadvantage in that; for though he had as good officers at least as any then served the Parliament, yet I doubt he had not so useful counsel as was necessary. And for his soldiers, though they were men as stout as theirs, yet, because their valour was not sharpened so with malice as theirs was on the other side, they fought not so keenly as their enemies did: amongst whom there were a great many London apprentices, who, for want of experience in the war, would have been fearful enough of death and wounds approaching visibly in glistering swords; but, for want of judgment, scarce thought of such death as comes invisibly in a bullet, and therefore were very hardly to be driven out of the field.

B.

But what fault do you find in the King's counsellors, lords, and other persons of quality and experience?

A.

Only that fault, which was generally in the whole nation, which was, that they thought the government of England was not an absolute, but a mixed monarchy; and that if the King should clearly subdue this Parliament, that his power would be what he pleased, and theirs as little as he pleased: which they counted tyranny. This opinion, though it did not lessen their endeavour to gain the victory for the King in a battle, when a battle could not be avoided, yet it weakened their endeavour to procure him an absolute victory in the war. And for this cause, notwithstanding that they saw that the Parliament was firmly resolved to take all kingly power whatsoever out of his hands, yet their counsel to the King was upon all occasions, to offer propositions to them of treaty and accommodation, and to make and publish declarations; which any man might easily have foreseen would be fruitless; and not only so, but also of great disadvantage to those actions by which the King was to recover his crown and preserve his life. For it took off the courage of the best and forwardest of his soldiers, that looked for great benefit by their service out of the estates of the rebels, in case they could subdue them; but none at all, if the business should be ended by a treaty.

B.

And they had reason: for a civil war never ends by treaty, without the sacrifice of those who were on both sides the sharpest. You know well enough how things passed at the reconciliation of Augustus and Antonius in Rome. But I thought that after they once began to levy soldiers one against another, that they would not any more have returned of either side to declarations, or other paper war, which, if it could have done any good, would have done it long before this.

A.

But seeing the Parliament continued writing, and set forth their declarations to the people against the lawfulness of the King's commission of array, and sent petitions to the King as fierce and rebellious as ever they had done before, demanding of him that he would disband his soldiers, and come up to the Parliament, and leave those whom the Parliament called delinquents (which were none but the King's best subjects) to their mercy, and pass such bills as they should advise him; would you not have the King set forth declarations and proclamations against the illegality of their ordinances, by which they levied soldiers against him, and answer those insolent petitions of theirs?

B.

No; it had done him no good before, and therefore was not likely to do him any afterwards. For the common people, whose hands were to decide the controversy, understood not the reasons of either party; and for those that by ambition were once set upon the enterprise of changing the government, they cared not much what was reason and justice in the cause, but what strength they might procure by reducing the multitude with remonstrances from the Parliament House, or by sermons in the churches. And to their petitions, I would not have had any answer made at all, more than this; that if they would disband their army, and put themselves upon his mercy, they should find him more gracious than they expected.

A.

That had been a gallant answer indeed, if it had proceeded from him after some extraordinary great victory in battle, or some extraordinary assurance of a victory at last in the whole war.

B.

Why, what could have happened to him worse than at length he suffered, notwithstanding his gentle answers and all his reasonable declarations?

A.

Nothing; but who knew that?

B.

Any man might see that he was never likely to be restored to his right without victory: and such his stoutness being known to the people, would have brought to his assistance many more hands than all the arguments of law or force of eloquence, couched in declarations and other writings, could have done by far. And I wonder what kind of men they were, that hindered the King from taking this resolution?

A.

You may know by the declarations themselves, which are very long and full of quotations of records and of cases formerly reported, that the penners of them were either lawyers by profession, or such gentlemen as had the ambition to be thought so. Besides, I told you before, that those which were then likeliest to have their counsel asked in this business, were averse to absolute monarchy, as also to absolute democracy or aristocracy; all which governments they esteemed

tyranny, and were in love with monarchy which they used to praise by the name of mixed monarchy, though it were indeed nothing else but pure anarchy. And those men, whose pens the King most used in these controversies of law and politics, were such, if I have not been misinformed, as having been members of this Parliament, had declaimed against ship-money and other extra-parliamentary taxes, as much as any; but who when they saw the Parliament grow higher in their demands than they thought they would have done, went over to the King's party.

B.

Who were those?

A.

It is not necessary to name any man, seeing I have undertaken only a short narration of the follies and other faults of men during this trouble; but not, by naming the persons, to give you, or any man else, occasion to esteem them the less, now that the faults on all sides have been forgiven.

B.

When the business was brought to this height, by levying of soldiers and seizing of the navy and arms and other provisions on both sides, that no man was so blind as not to see they were in an estate of war one against another; why did not the King, by proclamation or message, according to his undoubted right, dissolve the Parliament, and thereby diminish in some part the authority of their levies, and of other their unjust ordinances?

A.

You have forgotten that I told you, that the King himself, by a bill that he passed at the same time when he passed the bill for the execution of the Earl of Strafford, had given them authority to hold the Parliament till they should by consent of both Houses dissolve themselves. If therefore he had, by any proclamation or message to the Houses, dissolved them, they would to their former defamations of his Majesty's actions have added this, that he was a breaker of his word: and not only in contempt of him have continued their session, but also have made an advantage of it to the increase and strengthening of their own party.

B.

Would not the King's raising of an army against them be interpreted as a purpose to dissolve them by force? And was it not as great a breach of promise to scatter them by force, as to dissolve them by proclamation? Besides, I cannot conceive that the passing of that act was otherwise intended than conditionally; so long as they should not ordain any thing contrary to the sovereign right of the King; which condition they had already by many of their ordinances broken. And I think that even by the law of equity, which is the unalterable law of nature, a man that has the sovereign power, cannot, if he would, give away the right of anything which is necessary for him to retain for the good government of his subjects, unless he do it in express words, saying, that he will have the sovereign power no longer. For the giving away that, which by consequence only, draws the sovereignty along with it, is not, I think, a giving away of the sovereignty; but an error, such as works nothing but an invalidity in the grant itself. And such was the King's passing of this bill for the continuing of the Parliament as long as the two Houses

pleased. But now that the war was resolved on on both sides, what needed any more dispute in writing?

A.

I know not what need they had. But on both sides they thought it needful to hinder one another, as much as they could, from levying of soldiers; and, therefore, the King did set forth declarations in print, to make the people know that they ought not to obey the officers of the new militia set up by ordinance of Parliament, and also to let them see the legality of his own commissions of array. And the Parliament on their part did the like, to justify to the people the said ordinance, and to make the commission of array appear unlawful.

B.

When the Parliament were levying of soldiers, was it not lawful for the King to levy soldiers to defend himself and his right, though there had been no other title for it but his own preservation, and that the name of commission of array had never before been heard of?

A.

For my part, I think there cannot be a better title for war, than the defence of a man's own right. But the people, at that time, thought nothing lawful for the King to do, for which there was not some statute made by Parliament. For the lawyers, I mean the judges of the courts at Westminster, and some few others, though but advocates, yet of great reputation for their skill in the common-laws and statutes of England, had infected most of the gentry of England with their maxims and cases prejudged, which they call precedents; and made them think so well of

their own knowledge in the law, that they were very glad of this occasion to shew it against the King, and thereby to gain a reputation with the Parliament of being good patriots, and wise statesmen.

B.

What was this commission of array?

A.

King William the Conqueror had gotten into his hands by victory all the land in England, of which he disposed some part as forests and chases for his recreation, and some part to lords and gentlemen that had assisted him or were to assist him in the wars. Upon which he laid a charge of service in his wars, some with more men, and some with less, according to the lands he had given them: whereby, when the King sent men unto them with commission to make use of their service, they were obliged to appear with arms, and to accompany the King to the wars for a certain time at their own charges: and such were the commissions by which this King did then make his levies.

B.

Why then was it not legal?

A.

No doubt but it was legal. But what did that amount to with men, that were already resolved to acknowledge for law nothing that was against their design of abolishing monarchy, and placing a sovereign and absolute arbitrary power in the House of Commons.

B.

To destroy monarchy, and set up the House of Commons, are two businesses.

A.

They found it so at last, but did not think it so then.

B.

Let us now come to the military part.

A.

I intended only the story of their injustice, impudence, and hypocrisy; therefore, for the proceeding of the war, I refer you to the history thereof written at large in English. I shall only make use of such a thread as is necessary for the filling up of such knavery, and folly also, as I shall observe in their several actions.

From York the King went to Hull, where was his magazine of arms for the northern parts of England, to try if they would admit him. The Parliament had made Sir John Hotham governor of the town, who caused the gates to be shut, and presenting himself upon the walls flatly denied him entrance: for which the King caused him to be proclaimed traitor, and sent a message to the Parliament to know if they owned the action.

B.

Upon what grounds?

A.

Their pretence was this; that neither this nor any other town in England was otherwise the King's, than in trust for the people of England.

B.

But what was that to the Parliament?

A.

Yes, say they; for we are the representatives of the people of England.

B.

I cannot see the force of this argument: we represent the people, ergo, all that the people has is ours. The mayor of Hull did represent the King. Is therefore all that the King had in Hull, the mayor's? The people of England may be represented with limitations, as to deliver a petition or the like. Does it follow that they, who deliver the petition, have right to all the towns in England? When began this Parliament to be a representative of England? Was it not November 3, 1640? Who was it the day before, that is November 2, that had the right to keep the King out of Hull and possess it for themselves? For there was then no Parliament. Whose was Hull then?

A.

I think it was the King's, not only because it was called the King's town upon Hull, but because the King himself did then and ever represent the person of the people of England. If he did not, who then did, the Parliament having no being?

B.

They might perhaps say, the people had then no representative.

A.

Then there was no commonwealth; and consequently, all the towns of England being the people's, you, and I, and any man else, might have put in for his share. You may see by this what weak people they were, that were carried into the rebellion by such reasoning as the Parliament used, and how impudent they were that did put such fallacies upon them.

B.

Surely they were such as were esteemed the wisest men in England, being upon that account chosen to be of the Parliament.

A.

And were they also esteemed the wisest men of England, that chose them?

B.

I cannot tell that. For I know it is usual with the freeholders in the counties, and the tradesmen in the cities and boroughs, to choose, as near as they can, such as are most repugnant to the giving of subsidies.

A.

The King in the beginning of August, after he had summoned Hull, and tried some of the counties thereabout what they would do for him, sets

up his standard at Nottingham; but there came not in thither men enough to make an army sufficient to give battle to the Earl of Essex. From thence he went to Shrewsbury, where he was quickly furnished; and appointing the Earl of Lindsey to be general, he resolved to march towards London. The Earl of Essex was now at Worcester with the Parliament's army, making no offer to stop him in his passage; but as soon as he was gone by, marched close after him.

The King, therefore, to avoid being enclosed between the army of the Earl of Essex and the city of London, turned upon him and gave him battle at Edgehill: where though he got not an entire victory, yet he had the better, if either had the better; and had certainly the fruit of a victory, which was to march on in his intended way towards London: in which the next morning he took Banbury-castle, and from thence went to Oxford, and thence to Brentford, where he gave a great defeat to three regiments of the Parliament's forces, and so returned to Oxford.

B.

Why did not the King go on from Brentford?

A.

The Parliament, upon the first notice of the King's marching from Shrewsbury, caused all the trained-bands and the auxiliaries of the city of London (which was so frightened as to shut up all their shops) to be drawn forth; so that there was a most complete and numerous army ready for the Earl of Essex, that was crept into London just at the time to head it. And this was it that made the King retire to Oxford. In the beginning of February after, Prince Rupert took Cirencester from the Parliament, with many prisoners and many arms: for it was newly made a magazine. And thus stood the business between the King's and the

Parliament's greatest forces. The Parliament in the meantime caused a line of communication to be made about London and the suburbs, of twelve miles in compass; and constituted a committee for the association, and the putting into a posture of defence, of the counties of Essex, Cambridge, Suffolk, and some others; and one of these commissioners was Oliver Cromwell, from which employment he came to his following greatness.

B.

What was done during this time in other parts of the country?

A.

In the west, the Earl of Stamford had the employment of putting in execution the ordinance of Parliament for the militia; and Sir Ralph Hopton for the King executed the commission of array. Between these two was fought a battle at Liskeard in Cornwall, wherein Sir Ralph Hopton had the victory, and presently took a town called Saltash, with many arms and much ordnance and many prisoners. Sir William Waller in the meantime seized Winchester and Chichester for the Parliament. In the north, for the commission of array, my Lord of Newcastle, and for the militia of the Parliament was my Lord Fairfax. My Lord of Newcastle took from the Parliament Tadcaster, in which were a great part of the Parliament's forces for that country, and had made himself, in a manner, master of all the north. About this time, that is to say in February, the Queen landed at Burlington, and was conducted by my Lord of Newcastle and the Marquis of Montrose to York, and not long after to the King. Divers other little advantages, besides these, the King's party had of the Parliament's in the north.

There happened also between the militia of the Parliament and the Commission of Array in Staffordshire, under my Lord Brook for the Parliament and my Lord of Northampton for the King, great contention, wherein both these commanders were slain. For my Lord Brook, besieging Litchfield-Close, was killed with a shot; notwithstanding which they gave not over the siege till they were masters of the Close. But presently after, my Lord of Northampton besieged it again for the King; which to relieve, Sir William Brereton and Sir John Gell advanced towards Litchfield, and were met at Hopton Heath by the Earl of Northampton, and routed. The Earl himself was slain; but his forces with victory returned to the siege again; and shortly after, seconded by Prince Rupert, who was then abroad in that country, carried the place. These were the chief actions of this year, 1642; wherein the King's party had not much the worse.

B.

But the Parliament had now a better army; insomuch that if the Earl of Essex had immediately followed the King to Oxford, not yet well fortified, he might in all likelihood have taken it. For he could not want either men or ammunition, whereof the city of London, which was wholly at the Parliament's devotion, had store enough.

A.

I cannot judge of that. But this is manifest, considering the estate the King was in at his first marching from York, when he had neither money nor men nor arms enough to put them in hope of victory, that this year, take it altogether, was very prosperous.

B.

But what great folly or wickedness do you observe in the Parliament's actions for this first year?

A.

All that can be said against them in that point, will be excused with the pretext of war, and come under one name of rebellion; saving that when they summoned any town, it was always in the name of King and Parliament, the King being in the contrary army, and many times beating them from the siege. I do not see how the right of war can justify such impudence as that. But they pretended that the King was always virtually in the two Houses of Parliament; making a distinction between his person natural and politic; which made the impudence the greater, besides the folly of it. For this was but an university quibble, such as boys make use of in maintaining in the schools such tenets as they cannot otherwise defend.

In the end of this year they solicited also the Scots to enter England with an army, to suppress the power of the Earl of Newcastle in the North; which was a plain confession, that the Parliament's forces were, at this time, inferior to the King's. And most men thought, that if the Earl of Newcastle had then marched southward, and joined his forces with the King's, most of the members of Parliament would have fled out of England.

In the beginning of 1643 the Parliament, seeing the Earl of Newcastle's power in the North grown so formidable, sent to the Scots to hire them to an invasion of England, and (to compliment them in the meantime) made a covenant amongst themselves, such as the Scots had before taken against episcopacy, and demolished crosses and church-windows, such as had in them any images of saints, throughout all England. Also

in the middle of the year, they made a solemn league with the nation, which was called the Solemn League and Covenant.

B.

Are not the Scots as properly to be called foreigners as the Irish? Seeing then they persecuted the Earl of Strafford even to death, for advising the King to make use of Irish forces against the Parliament, with what face could they call in a Scotch army against the King?

A.

The King's party might easily here have discerned their design, to make themselves absolute masters of the kingdom and to dethrone the King. Another great impudence, or rather a bestial incivility, it was of theirs, that they voted the Queen a traitor, for helping the King with some ammunition and English forces from Holland.

B.

Was it possible that all this could be done, and men not see that papers and declarations must be useless; and that nothing could satisfy them but the deposing of the King, and setting up of themselves in his place?

A.

Yes; very possible. For who was there of them, though knowing that the King had the sovereign power, that knew the essential rights of sovereignty? They dreamt of a mixed power, of the King and the two Houses. That it was a divided power, in which there could be no peace, was above their understanding. Therefore they were always urging the King to declarations and treaties, for fear of subjecting themselves to the

King in an absolute obedience; which increased the hope and courage of the rebels, but did the King little good. For the people either understand not, or will not trouble themselves with controversies in writing, but rather, by his compliance and messages, go away with an opinion that the Parliament was likely to have the victory in the war. Besides, seeing the penners and contrivers of these papers were formerly members of the Parliament, and of another mind, and now revolted from the Parliament because they could not bear that sway in the House which they expected, men were apt to think they believed not what they writ.

As for military actions (to begin at the head quarters) Prince Rupert took Birmingham, a garrison of the Parliament's. In July after, the King's forces had a great victory over the Parliament's, near Devizes on Roundway-Down, where they took 2,000 prisoners, four brass pieces of ordnance, twenty-eight colours, and all their baggage; and shortly after, Bristol was surrendered to Prince Rupert for the King; and the King himself marching into the west, took from the Parliament many other considerable places.

But this good fortune was not a little allayed by his besieging of Gloucester, which after it was reduced to the last gasp, was relieved by the Earl of Essex; whose army was before greatly wasted, but now suddenly recruited with the trained bands and apprentices of London.

B.

It seems not only by this, but also by many examples in history, that there can hardly arise a long or dangerous rebellion, that has not some such overgrown city with an army or two in its belly to foment it.

A.

Nay more; those great capital cities, when rebellion is upon pretence of grievances, must needs be of the rebel party: because the grievances are but taxes, to which citizens, that is, merchants, whose profession is their private gain, are naturally mortal enemies; their only glory being to grow excessively rich by the wisdom of buying and selling.

B.

But they are said to be of all callings the most beneficial to the commonwealth, by setting the poorer sort of people on work.

A.

That is to say, by making poor people sell their labour to them at their own prices; so that poor people, for the most part, might get a better living by working in Bridewell, than by spinning, weaving, and other such labour as they can do; saving that by working slightly they may help themselves a little, to the disgrace of our manufacture. And as most commonly they are the first encouragers of rebellion, presuming of their strength; so also are they, for the most part, the first to repent, deceived by them that command their strength.

But to return to the war; though the King withdrew from Gloucester, yet it was not to fly from, but to fight with the Earl of Essex, which presently after he did at Newbury, where the battle was bloody, and the King had not the worst, unless Cirencester be put into the scale, which the Earl of Essex had in his way a few days before surprised.

But in the north and the west, the King had much the better of the Parliament. For in the north, at the very beginning of the year, March 29th, the Earls of Newcastle and Cumberland defeated the Lord Fairfax, who commanded in those parts for the Parliament, at Bramham Moor; which made the Parliament to hasten the assistance of the Scots.

In June following the Earl of Newcastle routed Sir Thomas Fairfax, son to the Lord Fairfax, upon Adderton Heath, and, in pursuit of them to Bradford, took and killed 2,000 men, and the next day took the town and 2,000 prisoners more (Sir Thomas himself hardly escaping) with all their arms and ammunition; and besides this, made the Lord Fairfax quit Halifax and Beverley. Lastly, Prince Rupert relieved Newark, besieged by Sir John Meldrun for the Parliament with 7,000 men, whereof 1,000 were slain; the rest upon articles departed, leaving behind them their arms, bag and baggage.

To balance in part this success, the Earl of Manchester, whose lieutenant-general was Oliver Cromwell, got a victory over the royalists near Horncastle, of whom he slew 400, took 800 prisoners and 1,000 arms, and presently after took and plundered the city of Lincoln.

In the West, May the 16th, Sir Ralph Hopton at Stratton, in Cornwall, had a victory over the Parliamentarians, wherein he took 1700 prisoners, thirteen brass pieces of ordnance, and all their ammunition, which was seventy barrels of powder; and the magazine of their other provisions in the town.

Again at Lansdown, between Sir Ralph Hopton and the Parliamentarians under Sir William Waller, was fought a fierce battle, wherein the victory was not very clear on either side; saving that the Parliamentarians might seem to have the better, because presently after Sir William Waller followed Sir Ralph Hopton to Devizes, in Wiltshire, though to his cost; for there he was overthrown, as I have already told you.

After this the King in person marched into the West, and took Exeter, Dorchester, Barnstable, and divers other places; and had he not at his return besieged Gloucester, and thereby given the Parliament time for new levies, it was thought by many he might have routed the House of

Commons. But the end of this year was more favourable to the Parliament. For in January the Scots entered England, and, March the 1st, crossed the Tyne; and whilst the Earl of Newcastle was marching to them, Sir Thomas Fairfax gathered together a considerable party in Yorkshire, and the Earl of Manchester from Lyn advanced towards York; so that the Earl of Newcastle having two armies of the rebels behind him, and another before him, was forced to retreat to York; which those three armies joining presently besieged. And these are all the considerable military actions of the year 1643.

In the same year the Parliament caused to be made a new Great Seal. The Lord Keeper had carried the former seal to Oxford. Hereupon the King sent a messenger to the judges at Westminster, to forbid them to make use of it. This messenger was taken, and condemned at a council of war, and hanged for a spy.

B.

Is that the law of war?

A.

I know not: but it seems, when a soldier comes into the enemies' quarters without address or notice given to the chief commander, that it is presumed he comes as a spy. The same year, when certain gentlemen at London received a commission of array from the King to levy men for his service in that city, being discovered, they were condemned, and some of them executed. This case is not much unlike the former.

B.

Was not the making of a new Great Seal a sufficient proof that the war was raised, not to remove evil counsellors from the King, but to remove the King himself from the government? What hope then could there be had in messages and treaties?

A.

The entrance of the Scots was a thing unexpected to the King, who was made to believe by continual letters from his commissioner in Scotland, Duke Hamilton, that the Scotch never intended any invasion. The Duke being then at Oxford, the King, assured that the Scotch were now entered, sent him prisoner to Pendennis Castle in Cornwall.

In the beginning of the year 1644, the Earl of Newcastle being, as I told you, besieged by the joint forces of the Scots, the Earl of Manchester and Sir Thomas Fairfax, the King sent Prince Rupert to relieve the town, and as soon as he could to give the enemy battle. Prince Rupert passing through Lancashire, and by the way having stormed that seditious town of Bolton, and taken Stockford and Liverpool, came to York July the 1st, and relieved it; the enemy being risen thence to a place called Marston Moor, about four miles off; and there was fought that unfortunate battle, which lost the King in a manner all the north. Prince Rupert returned by the way he came, and the Earl of Newcastle to York, and thence with some of his officers over the sea to Hamburgh.

The honour of this victory was attributed chiefly to Oliver Cromwell, the Earl of Manchester's lieutenant-general. The Parliamentarians returned from the field to the siege of York, which not long after, upon honourable articles, was surrendered; not that they were favoured, but because the Parliament employed not much time nor many men in sieges.

B.

This was a great and sudden abatement of the King's prosperity.

A.

It was so; but amends was made him for it within five or six weeks after. For Sir William Waller, after the loss of his army at Roundway-Down, had another raised for him by the city of London; who for the payment thereof imposed a weekly tax of the value of one meal's meat upon every citizen. This army, with that of the Earl of Essex, intended to besiege Oxford; which the King understanding, sent the Queen into the west, and marched himself towards Worcester. This made them to divide again, and the Earl to go into the west, and Waller to pursue the King. By this means, as it fell out, both their armies were defeated. For the King turned upon Waller, routed him at Cropredy-bridge, took his train of artillery and many officers; and then presently followed the Earl of Essex into Cornwall, where he had him at such advantage, that the Earl himself was fain to escape in a small boat to Plymouth; his horse broke through the King's quarters by night, but the infantry were all forced to lay down their arms, and upon condition never more to bear arms against the King were permitted to depart.

In October following was fought a second and sharp battle at Newbury. For this infantry, making no conscience of the conditions made with the King, being now come towards London as far as Basingstoke, had arms put again into their hands; to whom some of the trained-bands being added, the Earl of Essex had suddenly so great an army, that he attempted the King again at Newbury; and certainly had the better of the day, but the night parting them, had not a complete victory. And it was

observed here, that no part of the Earl's army fought so keenly as they who had laid down their arms in Cornwall.

These were the most important fights in the year 1644, and the King was yet, as both himself and others thought, in as good condition as the Parliament, which despaired of victory by the commanders they then used. Therefore they voted a new modelling of the army, suspecting the Earl of Essex, though I think wrongfully, to be too much a royalist, for not having done so much as they looked for in this second battle at Newbury. The Earls of Essex and Manchester, perceiving what they went about, voluntarily laid down their commissions; and the House of Commons made an ordinance, that no member of either House should enjoy any office or command, military or civil; with which oblique blow they shook off those that had hitherto served them too well. And yet out of this ordinance they excepted Oliver Cromwell, in whose conduct and valour they had very great confidence (which they would not have done, if they had known him as well then as they did afterwards), and made him lieutenant-general to Sir Thomas Fairfax, their new-made general. In the commission to the Earl of Essex, there was a clause for the preservation of his Majesty's person, which in this new commission was left out; though the Parliament as well as the general were as yet Presbyterian.

B.

It seems the Presbyterians also in order to their ends would fain have had the King murdered.

A.

For my part I doubt it not. For a rightful king living, an usurping power can never be sufficiently secured.

In this same year the Parliament put to death Sir John Hotham and his son, for tampering with the Earl of Newcastle about the rendition of Hull; and Sir Alexander Carew, for endeavouring to deliver up Plymouth, where he was governor for the Parliament; and the Archbishop of Canterbury, for nothing but to please the Scots; for the general article of going about to subvert the fundamental laws of the land, was no accusation, but only foul words. They then also voted down the Book of Common-prayer, and ordered the use of a Directory, which had been newly composed by an Assembly of Presbyterian ministers. They were also then, with much ado, prevailed with for a treaty with the King at Uxbridge; where they remitted nothing of their former demands. The King had also at this time a Parliament at Oxford, consisting of such discontented members as had left the Houses at Westminster; but few of them had changed their old principles, and therefore that Parliament was not much worth. Nay rather, because they endeavoured nothing but messages and treaties, that is to say, defeating of the soldiers' hope of benefit by the war, they were thought by most men to do the King more hurt than good.

The year 1645 was to the King very unfortunate; for by the loss of one great battle, he lost all he had formerly gotten, and at length his life. The new modelled army, after consultation whether they should lay siege to Oxford or march westward to the relief of Taunton, (then besieged by the Lord Goring, and defended by Blake, famous afterwards for his actions at sea), resolved for Taunton; leaving Cromwell to attend the motions of the King, though not strong enough to hinder him. The King upon this advantage drew his forces and artillery out of Oxford. This made the Parliament to call back their general, Fairfax, and order him to besiege Oxford. The King in the meantime relieved Chester, which was besieged by Sir William Brereton, and coming back took Leicester by

force; a place of great importance, and well provided of artillery and provision.

Upon this success it was generally thought that the King's party was the stronger. The King himself thought so; and the Parliament in a manner confessed the same, by commanding Fairfax to rise from the siege, and endeavour to give the King battle. For the successes of the King, and the divisions and treacheries growing now amongst themselves, had driven them to rely upon the fortune of one day; in which, at Naseby, the King's army was utterly overthrown, and no hope left him to raise another. Therefore after the battle he went up and down, doing the Parliament here and there some shrewd turns, but never much increasing his number.

Fairfax in the meantime first recovered Leicester, and then marching into the west subdued it all, except only a few places, forcing with much ado my Lord Hopton upon honourable conditions to disband his army, and with the Prince of Wales to pass over to Scilly; whence not long after they went to Paris.

In April 1646 General Fairfax began to march back to Oxford. In the meantime Rainsborough, who besieged Woodstock, had it surrendered. The King therefore, who was now also returned to Oxford, from whence Woodstock is but six miles, not doubting but that he should there by Fairfax be besieged, and having no army, to relieve him, resolved to get away disguised to the Scotch army about Newark; and thither he came the 4th of May; and the Scotch army, being upon remove homewards, carried him with them to Newcastle, whither he came May 13th.

B.

Why did the King trust himself with the Scots? They were the first that rebelled. They were Presbyterians, that is, cruel; besides, they were

indigent, and consequently might be suspected would sell him to his enemies for money. And lastly, they were too weak to defend him, or keep him in their country.

A.

What could he have done better? For he had in the winter before sent to the Parliament to get a pass for the Duke of Richmond and others, to bring them propositions of peace; it was denied. He sent again; it was denied again. Then he desired he might come to them in person; this also was denied. He sent again and again to the same purpose; but instead of granting it, they made an ordinance, that the commanders of the militia of London, in case the King should attempt to come within the line of communication, should raise what force they thought fit to suppress tumults, to apprehend such as came with him, and to secure, that is to imprison, his person from danger. If the King had adventured to come, and had been imprisoned, what could the Parliament have done with him? They had dethroned him by their votes, and therefore could have no security whilst he lived, though in prison. It may be they would not have put him to death by a high court of justice publicly, but secretly some other way.

B.

He should have attempted to get beyond sea.

A.

That had been from Oxford very difficult. Besides, it was generally believed that the Scotch army had promised him, that not only his Majesty, but also his friends that should come with him, should be in

their army safe; not only for their persons, but also for their honours and consciences. It is a pretty trick, when the army and the particular soldiers of the army are different things, to make the soldiers promise what the army means not to perform.

July the 11th the Parliament sent their propositions to the King at Newcastle; which propositions they pretended to be the only way to a settled and well grounded peace. They were brought by the Earl of Pembroke, the Earl of Suffolk, Sir Walter Earle, Sir John Hippisley, Mr. Goodwin, and Mr. Robinson; whom the King asked if they had power to treat; and when they said no, why they might not as well have been sent by a trumpeter. The propositions were the same dethroning ones which they used to send, and therefore the King would not assent to them. Nor did the Scots swallow them at first, but made some exceptions against them; only, it seems, to make the Parliament perceive they meant not to put the King into their hands gratis. And so at last the bargain was made between them; and upon the payment of 200,000l. the King was put into the hands of the commissioners, which the English Parliament sent down to receive him.

B.

What a vile complexion has this action, compounded of feigned religion and very covetousness, cowardice, perjury, and treachery!

A.

Now the war, that seemed to justify many unseemly things, is ended, you will see almost nothing else in these rebels but baseness and falseness besides their folly.

By this time the Parliament had taken in all the rest of the King's garrisons; whereof the last was Pendennis Castle, whither Duke

Hamilton had been sent prisoner by the King.

B.

What was done during this time in Ireland and Scotland?

A.

In Ireland there had been a peace made by order from his Majesty for a time, which by divisions amongst the Irish was ill kept. The Popish party, the Pope's nuncio being then there, took this to be the time for delivering themselves from their subjection to the English. Besides, the time of the peace was now expired.

B.

How were they subject to the English, more than the English to the Irish? They were subject to the King of England; but so also were the English to the King of Ireland.

A.

This distinction is somewhat too subtile for common understandings. In Scotland the Marquis of Montrose for the King, with very few men and miraculous victories, had overrun all Scotland, where many of his forces, out of too much security, were permitted to be absent for awhile; of which the enemy having intelligence, suddenly came upon them, and forced them to fly back into the Highlands to recruit; where he began to recover strength, when he was commanded by the King, then in the hands of the Scots at Newcastle, to disband; and he departed from Scotland by sea.

In the end of the same year, 1646, the Parliament caused the King's Great Seal to be broken; also the King was brought to Holmeby, and there kept by the Parliament's commissioners. And here was an end of that war as to England and Scotland, but not to Ireland. About this time also died the Earl of Essex, whom the Parliament had discarded.

B.

Now that there was peace in England, and the King in prison, in whom was the sovereign power?

A.

The right was certainly in the King, but the exercise was yet in nobody; but contended for as in a game at cards, without fighting, all the years 1647 and 1648, between the Parliament and Oliver Cromwell, lieutenant-general to Sir Thomas Fairfax.

You must know, that when King Henry VIII abolished the pope's authority here, and took upon him to be the head of the Church, the bishops, as they could not resist him, so neither were they discontented with it. For whereas before the pope allowed not the bishops to claim jurisdiction in their diocesses *jure divino*, that is of right immediately from God, but by the gift and authority of the pope, now that the pope was ousted, they made no doubt but that the divine right was in themselves. After this, the city of Geneva, and divers other places beyond sea, having revolted from the papacy, set up presbyteries for the government of their several churches. And divers English scholars, that went beyond sea during the persecution in the time of Queen Mary, were much taken with this government, and at their return in the time of Queen Elizabeth, and ever since, have endeavoured, to the great trouble of the Church and nation, to set up that government here, wherein they

might domineer and applaud their own wit and learning. And these took upon them not only a Divine right, but also a Divine inspiration. And having been connived at, and countenanced sometimes in their frequent preaching, they introduced many strange and many pernicious doctrines, out-doing the Reformation, as they pretended, both of Luther and Calvin; receding from the former divinity or church philosophy (for religion is another thing), as much as Luther and Calvin had receded from the pope; and distracted their auditors into a great number of sects, as Brownists, Anabaptists, Independents, Fifth-monarchy-men, Quakers, and divers others, all commonly called by the name of fanatics: insomuch as there was no so dangerous an enemy to the Presbyterians, as this brood of their own hatching.

These were Cromwell's best cards, whereof he had a very great number in the army, and some in the House, whereof he himself was thought one; though he were nothing certain, but, applying himself always to the faction that was strongest, was of a colour like it.

There were in the army a great number, if not the greatest part, that aimed only at rapine and sharing the lands and goods of their enemies; and these also, upon the opinion they had of Cromwell's valour and conduct, thought they could not any way better arrive at their ends than by adhering to him. Lastly, in the Parliament itself, though not the major part, yet a considerable number were fanatics enough to put in doubts, and cause delay in the resolutions of the House, and sometimes also by advantage of a thin House to carry a vote in favour of Cromwell, as they did upon the 26th of July. For whereas on the 4th of May precedent the Parliament had voted that the militia of London should be in the hands of a committee of citizens, whereof the Lord Mayor for the time being should be one; shortly after, the Independents, chancing to be the

majority, made an ordinance, by which it was put into hands more favourable to the army.

The best cards the Parliament had, were the city of London and the person of the King. The General, Sir Thomas Fairfax, was right Presbyterian, but in the hands of the army, and the army in the hands of Cromwell; but which party should prevail, depended on the playing of the game. Cromwell protested still obedience and fidelity to the Parliament; but meaning nothing less, bethought him and resolved on a way to excuse himself of all that he should do to the contrary upon the army. Therefore he and his son-in-law, Commissary-General Ireton (as good at contriving as himself, and at speaking and writing better), contrive how to mutiny the army against the Parliament. To this end they spread a whisper through the army, that the Parliament, now they had the King, intended to disband them, to cheat them of their arrears, and to send them into Ireland to be destroyed by the Irish. The army being herewith enraged, were taught by Ireton to erect a council amongst themselves of two soldiers out of every troop and every company, to consult for the good of the army, and to assist at the council of war, and to advise for the peace and safety of the kingdom. These were called adjutators; so that whatsoever Cromwell would have to be done, he needed nothing to make them do it but secretly to put it into the head of these adjutators. The effect of the first consultation was to take the King from Holmeby and to bring him to the army.

The general hereupon, by letter to the Parliament, excuses himself and Cromwell, and the body of the army, as ignorant of the fact; and that the King came away willingly with those soldiers that brought him: assuring them withal, that the whole army intended nothing but peace, nor opposed Presbytery, nor affected Independency, nor did hold any licentious freedom in religion.

B.

It is strange that Sir Thomas Fairfax could be so abused by Cromwell as to believe this which he himself here writes.

A.

I cannot believe that Cornet Joyce could go out of the army with 1,000 soldiers to fetch the King, and neither the general nor the lieutenant-general, nor the body of the army take notice of it. And that the King went willingly, appears to be false by a message sent on purpose from his Majesty to the Parliament.

B.

Here is perfidy upon perfidy: first, the perfidy of the Parliament against the King, and then the perfidy of the army against the Parliament.

A.

This was the first trick Cromwell played, whereby he thought himself to have gotten so great an advantage that he said openly, "That he had the Parliament in his pocket," as indeed he had, and the city too. For upon the news of it they were, both one and the other, in very great disorder, and the more, because there came with it a rumour that the army was marching up to London.

The King in the meantime, till his residence was settled at Hampton Court, was carried from place to place, not without some ostentation; but with much more liberty, and with more respect shewn him by far, than when he was in the hands of the Parliament's commissioners; for his own chaplains were allowed him, and his children and some friends

permitted to see him. Besides that, he was much complimented by Cromwell, who promised him, in a serious and seeming passionate manner, to restore him to his right against the Parliament.

B.

How was he sure he could do that?

A.

He was not sure; but he was resolved to march up to the city and Parliament, to set up the King again, and be the second man, unless in the attempt he found better hope, than yet he had, to make himself the first man by dispossessing the King.

B.

What assistance against the Parliament and the city could Cromwell expect from the King?

A.

By declaring directly for him he might have had all the King's party, which were many more now since his misfortune than ever they were before. For in the Parliament itself, there were many that had discovered the hypocrisy and private aims of their fellows: many were converted to their duty by their own natural reason; and their compassion for the King's sufferings had begot generally an indignation against the Parliament: so that if they had been by the protection of the present army brought together and embodied, Cromwell might have done what he had pleased, in the first place for the King, and in the second for

himself. But it seems he meant first to try what he could do without the King; and if that proved enough, to rid his hands of him.

B.

What did the Parliament and city do to oppose the army?

A.

First, the Parliament sent to the general to redeliver the King to their commissioners. Instead of an answer to this, the army sent articles to the Parliament, and with them a charge against eleven of their members, all of them active Presbyterians: of which articles these are some: 1. That the House may be purged of those, who, by the self-denying ordinance, ought not to be there; 2. That such as abused and endangered the kingdom, might be disabled to do the like hereafter; 3. That a day might be appointed to determine this Parliament; 4. That they would make an account to the kingdom of the vast sums of money they had received; 5. That the eleven members might presently be suspended sitting in the House. These were the articles that put them to their trumps; and they answered none of them, but that of the suspension of the eleven members, which they said they could not do by law till the particulars of the charge were produced: but this was soon answered with their own proceeding against the Archbishop of Canterbury and the Earl of Strafford.

The Parliament being thus somewhat awed, and the King made somewhat confident, he undertakes the city, requiring the Parliament to put the militia of London into other hands.

B.

What other hands? I do not well understand you.

A.

I told you that the militia of London was, on the 4th of May, put into the hands of the lord-mayor and other citizens, and soon after put into the hands of other men more favourable to the army. And now I am to tell you, that on July the 26th, the violence of certain apprentices and disbanded soldiers forced the Parliament to re-settle it as it was, in the citizens; and hereupon the two speakers and divers of the members ran away to the army, where they were invited and contented to sit and vote in the council of war in nature of a Parliament. And out of the citizens' hands they would have the militia taken away, and put again into those hands out of which it was taken the 26th of July.

B.

What said the city to this?

A.

The Londoners manned their works, viz: the line of communication; raised an army of valiant men within the line; chose good officers, all being desirous to go out and fight whensoever the city should give them order; and in that posture stood expecting the enemy.

The soldiers in the meantime enter into an engagement to live and die with Sir Thomas Fairfax, and the Parliament, and the army.

B.

That is very fine. They imitate that which the Parliament did, when they first took up arms against the King, styling themselves the King and

Parliament, maintaining that the King was always virtually in his Parliament: so the army now, making war against the Parliament, called themselves the Parliament and the army: but they might, with more reason, say, that the Parliament, since it was in Cromwell's pocket, was virtually in the army.

A.

Withal they send out a declaration of the grounds of their march towards London; wherein they take upon them to be judges of the Parliament, and of who are fit to be trusted with the business of the kingdom, giving them the name, not of the Parliament, but of the gentlemen at Westminster. For since the violence they were under July the 26th, the army denied them to be a lawful Parliament. At the same time they sent a letter to the mayor and aldermen of London, reproaching them with those late tumults; telling them they were enemies to the peace, treacherous to the Parliament, unable to defend either the Parliament or themselves; and demanded to have the city delivered into their hands, to which purpose, they said, they were now coming to them. The general also sent out his warrants to the counties adjacent, summoning their trained soldiers to join with them.

B.

Were the trained soldiers part of the general's army?

A.

No, nor at all in pay, nor could be without an order of Parliament. But what might an army not do, after it had mastered all the laws of the land? The army being come to Hounslow Heath, distant from London

but ten miles, the Court of Aldermen was called to consider what to do. The captains and soldiers of the city were willing, and well provided, to go forth and give them battle. But a treacherous officer, that had charge of a work on Southwark side, had let in within the line a small party of the enemies, who marched as far as to the gate of London-bridge; and then the Court of Aldermen, their hearts failing them, submitted on these conditions: to relinquish their militia; to desert the eleven members; to deliver up the forts and line of communication, together with the Tower of London, and all magazines and arms therein, to the army; to disband their forces and turn out all the reformadoes, that is, all Essex's old soldiers; to draw off the guards from the Parliament. All which was done, and the army marched triumphantly through the principal streets of the city.

B.

It is strange that the mayor and aldermen, having such an army, should so quickly yield. Might they not have resisted the party of the enemy at the bridge, with a party of their own; and the rest of the enemies, with the rest of their own?

A.

I cannot judge of that: but to me it would have been strange if they had done otherwise. For I consider the most part of rich subjects, that have made themselves so by craft and trade, as men that never look upon anything but their present profit; and who, to every thing not lying in that way, are in a manner blind, being amazed at the very thought of plundering. If they had understood what virtue there is to preserve their wealth in obedience to their lawful sovereign, they would never have sided with the Parliament; and so we had had no need of arming. The

mayor and aldermen therefore, being assured by this submission to save their goods, and not sure of the same by resisting, seem to me to have taken the wisest course. Nor was the Parliament less tame than the city. For presently, August the 6th, the general brought the fugitive speakers and members to the House with a strong guard of soldiers, and replaced the speakers in their chairs. And for this they gave the general thanks, not only there in the House, but appointed also a day for a holy thanksgiving; and not long after made him Generalissimo of all the forces of England and Constable of the Tower. But in effect all this was the advancement of Cromwell; for he was the usufructuary, though the property were in Sir Thomas Fairfax. For the Independents immediately cast down the whole line of communication; divided the militia of London, Westminster and Southwark, which were before united; displaced such governors of towns and forts as were not for their turn, though placed there by ordinance of Parliament; instead of whom, they put in men of their own party. They also made the Parliament to declare null all that had passed in the Houses from July the 26th to August the 6th, and clapped in prison some of the lords, and some of the most eminent citizens, whereof the lord mayor was one.

B.

Cromwell had power enough now to restore the King. Why did he not?

A.

His main end was to set himself in his place. The restoring of the King was but a reserve against the Parliament, which being in his pocket, he had no more need of the King, who was now an impediment to him. To keep him in the army was a trouble; to let him fall into the hands of the Presbyterians had been a stop to his hopes; to murder him privately,

besides the horror of the act, now whilst he was no more than lieutenant-general, would have made him odious without furthering his design. There was nothing better for his purpose than to let him escape from Hampton Court, where he was too near the Parliament, whither he pleased beyond the sea. For though Cromwell had a great party in the Parliament House whilst they saw not his ambition to be their master, yet they would have been his enemies as soon as that had appeared. To make the King attempt an escape, some of those that had him in custody, by Cromwell's direction told him that the adjutators meant to murder him; and withal caused a rumour of the same to be generally spread, to the end it might that way also come to the King's ear, as it did.

The King, therefore, in a dark and rainy night, his guards being retired, as it was thought, on purpose, left Hampton Court and went to the sea-side about Southampton, where a vessel had been bespoke to transport him but failed; so that the King was forced to trust himself with Colonel Hammond, then governor of the Isle of Wight; expecting perhaps some kindness from him, for Dr. Hammond's sake, brother to the colonel and his Majesty's much favoured chaplain. But it proved otherwise; for the colonel sent to his masters of the Parliament, to receive their orders concerning him. This going into the Isle of Wight was not likely to be any part of Cromwell's design, who neither knew whither nor which way he would go; nor had Hammond known any more than other men, if the ship had come to the appointed place in due time.

B.

If the King had escaped into France, might not the French have assisted him with forces to recover his kingdom, and so frustrated the designs both of Cromwell and all the King's other enemies?

A.

Yes, much; just as they assisted his son, our present most gracious Sovereign, who two years before fled thither out of Cornwall.

B.

It is methinks no great polity in neighbouring princes to favour, so often as they do, one another's rebels, especially when they rebel against monarchy itself. They should rather, first, make a league against rebellion, and afterwards, if there be no remedy, fight one against another. Nor will that serve the turn amongst Christian sovereigns, till preaching be better looked to, whereby the interpretation of a verse in the Hebrew, Greek, or Latin Bible, is oftentimes the cause of civil war and the deposing and assassinating of God's anointed. And yet, converse with those divinity-disputers as long as you will, you will hardly find one in a hundred discreet enough to be employed in any great affair either of war or peace. It is not the right of the sovereign, though granted to him by every man's express consent, that can enable him to do his office; it is the obedience of the subject, that must do that. For what good is it to promise allegiance, and then by and by to cry out, as some ministers did in the pulpit, To your tents, O Israel!? Common people know nothing of right or wrong by their own meditation; they must therefore be taught the grounds of their duty, and the reasons why calamities ever follow disobedience to their lawful sovereigns. But to the contrary, our rebels were publicly taught rebellion in the pulpits; and that there was no sin, but the doing of what the preachers forbade, or the omission of what they advised. But now the King was the Parliament's prisoner, why did not the Presbyterians advance their own interest by restoring him?

A.

The Parliament, in which there were more Presbyterians yet than Independents, might have gotten what they would of the King during his life, if they had not by an unconscionable and sottish ambition obstructed the way to their ends. They sent him four propositions, to be signed and passed by him as Acts of Parliament; telling him, when these were granted, they would send commissioners to treat with him of any other articles.

The propositions were these: First, that the Parliament should have the militia, and the power of levying money to maintain it, for twenty years; and after that term, the exercise thereof to return to the King, in case the Parliament think the safety of the kingdom concerned in it.

B.

The first article takes from the King the militia, and consequently the whole sovereignty for ever.

A.

The second was, that the King should justify the proceedings of the Parliament against himself; and declare void all oaths and declarations made by him against the Parliament.

B.

This was to make him guilty of the war, and of all the blood spilt therein.

A.

The third was, to take away all titles of honour conferred by the King since the Great Seal was carried to him in May 1642.

The fourth was, that the Parliament should adjourn themselves, when, and to what place, and for what time they pleased.

These propositions the King refused to grant, as he had reason; but sent others of his own, not much less advantageous to the Parliament, and desired a personal treaty with the Parliament for the settling of the peace of the kingdom. But the Parliament denying them to be sufficient for that purpose, voted that there should be no more addresses made to him, nor messages received from him; but that they would settle the kingdom without him. And this they voted partly upon the speeches and menaces of the army-faction then present in the House of Commons, whereof one advised these three points: 1. To secure the King in some inland castle with guards; 2. To draw up articles of impeachment against him; 3. To lay him by, and settle the kingdom without him.

Another said, that his denying of the four bills was the denying protection to his subjects; and that therefore they might deny him subjection; and added, that till the Parliament forsook the army, the army would never forsake the Parliament. This was threatening.

Last of all, Cromwell himself told them, it was now expected that the Parliament should govern and defend the kingdom, and not any longer let the people expect their safety from a man whose heart God had hardened; nor let those, that had so well defended the Parliament, be left hereafter to the rage of an irreconcilable enemy, lest they seek their safety some other way. This again was threatening; as also the laying his hand upon his sword when he spake it.

And hereupon the vote of non-addresses was made an ordinance; which the House would afterwards have recalled, but was forced by Cromwell to keep their word.

The Scotch were displeased with it; partly, because their brethren the Presbyterians had lost a great deal of their power in England; and partly also, because they had sold the King into their hands.

The King now published a passionate complaint to his people of this hard dealing with him; which made them pity him, but not yet rise in his behalf.

B.

Was not this, think you, the true time for Cromwell to take possession?

A.

By no means. There were yet many obstacles to be removed. He was not general of the army. The army was still for a Parliament. The city of London discontented about their militia. The Scots expected with an army to rescue the King. His adjutators were levellers, and against monarchy, who though they had helped him to bring under the Parliament, yet, like dogs that are easily taught to fetch, and not easily taught to render, would not make him king. So that Cromwell had these businesses following to overcome, before he could formally make himself a sovereign prince: 1. To be Generalissimo: 2. To remove the King: 3. To suppress all insurrections here: 4. To oppose the Scots: and lastly, to dissolve the present Parliament. Mighty businesses, which he could never promise himself to overcome. Therefore I cannot believe he then thought to be King; but only by well serving the strongest party, which was always his main polity, to proceed as far as that and fortune would carry him.

B.

The Parliament were certainly no less foolish than wicked, in deserting thus the King, before they had the army at a better command than they had.

A.

In the beginning of 1648 the Parliament gave commission to Philip Earl of Pembroke, then made Chancellor of Oxford, together with some of the doctors there as good divines as he, to purge the University. By virtue whereof they turned out all such as were not of their faction, and all such as had approved the use of the Common-prayer-book; as also divers scandalous ministers and scholars, that is, such as customarily and without need took the name of God into their mouths, or used to speak wantonly, or use the company of lewd women: and for this last I cannot but commend them.

B.

So shall not I; for it is just such another piece of piety, as to turn men out of an hospital because they are lame. Where can a man probably learn godliness, and how to correct his vices, better than in the universities erected for that purpose?

A.

It may be, the Parliament thought otherwise. For I have often heard the complaints of parents, that their children were debauched there to drunkenness, wantonness, gaming, and other vices consequent to these. Nor is it a wonder amongst so many youths, if they did corrupt one another in despite of their tutors, who oftentimes were little elder than themselves. And therefore I think the Parliament did not much

reverence that institution of universities, as to the bringing up of young men to virtue; though many of them learned there to preach, and became thereby capable of preferment and maintenance; and some others were sent thither by their parents, to save themselves the trouble of governing them at home, during that time wherein children are least governable. Nor do I think the Parliament cared more for the clergy than other men did. But certainly an university is an excellent servant to the clergy; and the clergy, if it be not carefully looked to, by their dissensions in doctrines and by the advantage to publish their dissensions, is an excellent means to divide a kingdom into factions.

B.

But seeing there is no place in this part of the world, where philosophy and other human sciences are not highly valued; where can they be learned better than in the Universities?

A.

What other sciences? Do not divines comprehend all civil and moral philosophy within their divinity? And as for natural philosophy, is it not removed from Oxford and Cambridge to Gresham College in London, and to be learned out of their gazettes? But we are gone from our subject.

B.

No; we are indeed gone from the greater businesses of the kingdom; to which, if you please, let us return.

A.

The first insurrection, or rather tumult, was that of the apprentices, on the 9th of April. But this was not upon the King's account, but arose from a customary assembly of them for recreation in Moorfields, whence some zealous officers of the trained soldiers would needs drive them away by force; but were themselves routed with stones; and had their ensign taken away by the apprentices, which they carried about in the streets, and frightened the lord mayor into his house; where they took a gun called a drake; and then they set guards at some of the gates, and all the rest of the day childishly swaggered up and down: but the next day the general himself marching into the city, quickly dispersed them. This was but a small business, but enough to let them see that the Parliament was ill-beloved of the people.

Next, the Welch took arms against them. There were three colonels in Wales, Langhorne, Poyer, and Powel, who had formerly done the Parliament good service, but now were commanded to disband; which they refused to do; and the better to strengthen themselves, declared for the King; and were about 8,000.

About the same time, in Wales also, was another insurrection, headed by Sir Nicholas Keymish, and another under Sir John Owen; so that now all Wales was in rebellion against the Parliament: and yet all these were overcome in a month's time by Cromwell and his officers; but not without store of bloodshed on both sides.

B.

I do not much pity the loss of those men, that impute to the King that which they do upon their own quarrel.

A.

Presently after this, some of the people of Surrey sent a petition to the Parliament for a personal treaty between the King and Parliament; but their messengers were beaten home again by the soldiers that were quartered about Westminster and the mews. And then the Kentish men having a like petition to deliver, and seeing how ill it was like to be received, threw it away and took up arms. They had many gallant officers, and for general the Earl of Norwich; and increased daily by apprentices and old disbanded soldiers. Insomuch as the Parliament was glad to restore to the city their militia, and to keep guards on the Thames side: and then Fairfax marched towards the enemy.

B.

And then the Londoners, I think, might easily and suddenly have mastered, first the Parliament, and next Fairfax his 8,000, and lastly Cromwell's army; or at least have given the Scotch army opportunity to march unfoughten to London.

A.

It is true: but the city was never good at venturing; nor were they or the Scots principled to have a King over them, but under them. Fairfax marching with his 8,000 against the royalists, routed a part of them at Maidstone; another part were taking in other places in Kent further off; and the Earl of Norwich with the rest came to Blackheath, and thence sent to the city to get passage through it, to join with those which were risen in Essex under Sir Charles Lucas and Sir George Lisle; which being denied, the greatest part of his Kentish men deserted him. With the rest, not above 500, he crossed the Thames into the Isle of Dogs, and so to Bow, and thence to Colchester. Fairfax having notice of this, crossed the Thames at Gravesend; and overtaking them, besieged them

in Colchester. The town had no defence but a breastwork, and yet held out, upon hope of the Scotch army to relieve them, the space of two months. Upon the news of the defeat of the Scots they were forced to yield. The Earl of Norwich was sent prisoner to London. Sir Charles Lucas and Sir George Lisle, two loyal and gallant persons, were shot to death. There was also another little insurrection, headed by the Earl of Holland, about Kingston; but quickly suppressed, and he himself taken prisoner.

B.

How came the Scots to be so soon dispatched?

A.

Merely, as it is said, for want of conduct. Their army was led by Duke Hamilton, who was then set at liberty, when Pendennis Castle, where he was prisoner, was taken by the Parliamentarians. He entered England with horse and foot 15,000, to which came above 3,000 English royalists. Against these Cromwell marched out of Wales with horse and foot 11,000, and near to Preston in Lancashire, in less than two hours, defeated them. And the cause of it is said to be, that the Scotch army was so ordered as they could not all come to the fight, nor relieve their fellows. After the defeat, they had no way to fly but further into England; so that in the pursuit they were almost all taken, and lost all that an army can lose; for the few that got home, did not all bring home their swords. Duke Hamilton was taken, and not long after sent to London. But Cromwell marched on to Edinburgh, and there, by the help of the faction which was contrary to Hamilton's, he made sure not to be hindered in his designs; the first whereof was to take away the King's life by the hand of the Parliament.

Whilst these things passed in the north, the Parliament, Cromwell being away, came to itself, and recalling their vote of non-addresses, sent to the King new propositions, somewhat, but not much, easier than formerly. And upon the King's answer to them, they sent commissioners to treat with him at Newport in the Isle of Wight; where they so long dodged with him about trifles, that Cromwell was come to London before they had done, to the King's destruction. For the army was now wholly at the devotion of Cromwell, who set the adjutators on work again to make a remonstrance to the House of Commons, wherein they require: 1. That the King be brought to justice: 2. That the Prince and the Duke of York be summoned to appear at a day appointed, and proceeded with, according as they should give satisfaction: 3. That the Parliament settle the peace and future government, and set a reasonable period to their own sitting, and make certain future Parliaments annual or biennial: 4. That a competent number of the King's chief instruments be executed. And this to be done both by the House of Commons and by a general agreement of the people testified by their subscriptions. Nor did they stay for an answer, but presently set a guard of soldiers at the Parliament-house door, and other soldiers in Westminster Hall, suffering none to go into the House but such as would serve their turns. All others were frighted away, or made prisoners, and some upon divers quarrels suspended; above ninety of them, because they had refused to vote against the Scots; and others, because they had voted against the vote of non-addresses: and the rest were a House for Cromwell. The fanatics also in the city being countenanced by the army, pack a new common-council, whereof any forty was to be above the mayor; and their first work was to frame a petition for justice against the King, which Tichborne, the mayor, involving the city in the regicide, delivered to the Parliament.

At the same time, with the like violence, they took the King from Newport in the Isle of Wight, to Hurst Castle, till things were ready for his trial. The Parliament in the meantime, to avoid perjury, by an ordinance declared void the oaths of supremacy and allegiance, and presently after made another to bring the King to his trial.

B.

This is a piece of law that I understood not before, that when many swear singly, they may, when they are assembled, if they please, absolve themselves.

A.

The ordinance being drawn up was brought into the House, where after three several readings it was voted, “that the Lords and Commons of England, assembled in Parliament, do declare, that by the fundamental laws of the realm, it is treason in the King of England to levy war against the Parliament.” And this vote was sent up to the Lords; and they denying their consent, the Commons in anger made another vote; “That all members of committees should proceed and act in any ordinance, whether the Lords concurred or no; and that the people, under God, are the original of all just power; and that the House of Commons have the supreme power of the nation; and that whatsoever the House of Commons enacteth, is law.” All this passed nemine contradicente.

B.

These propositions fight not only against the King of England, but against all the kings of the world. It were good they thought on it. But

yet, I believe, under God the original of all laws was in the people.

A.

But the people, for them and their heirs, by consent and oaths, have long ago put the supreme power of the nation into the hands of their kings, for them and their heirs; and consequently into the hands of this King, their known and lawful heir.

B.

But does not the Parliament represent the people?

A.

Yes, to some purposes; as to put up petitions to the King, when they have leave, and are grieved; but not to make a grievance of the King's power. Besides, the Parliament never represents the people but when the King calls them; nor is it to be imagined that he calls a Parliament to depose himself. Put the case, every county and borough should have given this Parliament for a benevolence a sum of money; and that every county, meeting in their county-court or elsewhere, and every borough in their town-hall, should have chosen men to carry their several sums respectively to the Parliament. Had not these men represented the whole nation?

B.

Yes, no doubt.

A.

Do you think the Parliament would have thought it reasonable to be called to account by this representative?

B.

No, sure; and yet I must confess the case is the same.

A.

This ordinance contained, first, a summary of the charge against the King, in substance this; that not content with the encroachments of his predecessors upon the freedom of the people, he had designed to set up a tyrannical government; and to that end, had raised and maintained in the land a civil war against the Parliament, whereby the country hath been miserably wasted, the public treasure exhausted, thousands of people murdered, and infinite other mischiefs committed. Secondly, a constitution passed of a high court of justice, that is, of a certain number of commissioners, of whom any twenty had power to try the King, and to proceed to sentence according to the merit of the cause, and see it speedily executed.

The commissioners met on Saturday, January 20th, in Westminster Hall, and the King was brought before them; where, sitting in a chair, he heard the charge read, but denied to plead to it either guilty or not guilty, till he should know by what lawful authority he was brought thither. The president told him that the Parliament affirmed their own authority; and the King still persevered in his refusal to plead. Though many words passed between him and the president, yet this was the substance of it all.

On Monday January 22nd the court met again, and the solicitor moved that if the King persisted in denying the authority of the court, the

charge might be taken pro confesso: but the King still denied their authority.

They met again January the 23rd, and then the solicitor moved the court for judgment; whereupon the King was required to give his final answer; which was again a denial of their authority.

Lastly, they met again January the 27th, where the King desired to be heard before the Lords and Commons in the Painted Chamber, and promising after that to abide the judgment of the court. The commissioners retired for half an hour to consider of it, and then returning caused the King to be brought again to the bar, and told him that what he proposed was but another denial of the court's jurisdiction; and that if he had no more to say, they would proceed. Then the King answering that he had no more to say, the president began a long speech in justification of the Parliament's proceedings, producing the examples of many kings killed or deposed by wicked Parliaments, ancient and modern, in England, Scotland, and other parts of the world. All which he endeavoured to justify from this only principle; that the people have the supreme power, and the Parliament is the people. This speech ended, the sentence of death was read; and the same upon Tuesday after, January 30th, executed at the gate of his own palace of Whitehall. He that can delight in reading how villainously he was used by the soldiers between the sentence and execution, may go to the chronicle itself; in which he shall see what courage, patience, wisdom, and goodness was in this prince, whom in their charge the members of that wicked Parliament styled tyrant, traitor, and murderer.

The King being dead, the same day they made an act of Parliament, that whereas several pretences might be made to the crown, &c. it is enacted by this present Parliament and by authority of the same, that no person presume to declare, proclaim, or publish, or any way promote Charles

Stuart, son of Charles late King of England, commonly called Prince of Wales, or any other person, to be King of England or Ireland, &c.

B.

Seeing the King was dead, and his successor barred; by what declared authority was the peace maintained?

A.

They had, in their anger against the Lords, formerly declared the supreme power of the nation to be in the House of Commons; and now, on February the 5th, they vote the House of Lords to be useless and dangerous. And thus the kingdom is turned into a democracy, or rather an oligarchy: for presently they made an act, that none of those members, who were secluded for opposing the vote of non-addresses, should ever be re-admitted. And these were commonly called the secluded members; and the rest were by some styled a Parliament, and by others the Rump.

I think you need not now have a catalogue, either of the vices, or of the crimes, or of the follies of the greatest part of them that composed the Long Parliament; than which greater cannot be in the world. What greater vices than irreligion, hypocrisy, avarice and cruelty; which have appeared so eminently in the actions of Presbyterian members, and Presbyterian ministers? What greater crimes than blaspheming and killing God's anointed; which was done by the hands of the Independents; but by the folly and first treason of the Presbyterians who betrayed and sold him to his murderers? Nor was it a little folly in the Lords, not to see that by the taking away of the King's power they lost withal their own privileges; or to think themselves, either for number or judgment, any way a considerable assistance to the House of Commons.

And for those men who had skill in the laws, it was no great sign of understanding not to perceive that the laws of the land were made by the King, to oblige his subjects to peace and justice, and not to oblige himself that made them. And lastly and generally, all men are fools which pull down anything which does them good, before they have set up something better in its place. He that would set up democracy with an army, should have an army to maintain it; but these men did it, when those men had the army that were resolved to pull it down. To these follies I might add the folly of those fine men, which out of their reading of Tully, Seneca, or other anti-monarchics, think themselves sufficient politicians, and show their discontents when they are not called to the management of the state, and turn from one side to another upon every neglect they fancy from the King or his enemies.

PART IV.

A.

You have seen the Rump in possession, as they believed, of the supreme power over the two nations of England and Ireland, and the army their servant; though Cromwell thought otherwise, serving them diligently for the advancement of his own purposes. I am now therefore to show you their proceedings.

B.

Tell me first, how this kind of government under the Rump or relic of a House of Commons is to be called?

A.

It is doubtless an oligarchy. For the supreme authority must needs be in one man or in more. If in one, it is monarchy; the Rump therefore was no monarchy. If the authority were in more than one, it was in all, or in fewer than all. When in all, it is democracy; for every man may enter into the assembly which makes the Sovereign Court; which they could not do here. It is therefore manifest, that the authority was in a few, and consequently the state was an oligarchy.

B.

Is it not impossible for a people to be well governed, that are to obey more masters than one?

A.

Both the Rump and all other sovereign assemblies, if they have but one voice, though they be many men, yet are they but one person. For contrary commands cannot consist in one and the same voice, which is the voice of the greatest part; and therefore they might govern well enough, if they had honesty and wit enough.

The first act of the Rump was the exclusion of those members of the House of Commons, which had been formerly kept out by violence for the procuring of an ordinance for the King's trial; for these men had appeared against the ordinance of non-addresses, and therefore were excluded, because they might else be an impediment to their future designs.

B.

Was it not rather, because in the authority of few they thought the fewer the better, both in respect of their shares and also of a nearer approach in every one of them to the dignity of king?

A.

Yes certainly, that was their principal end.

B.

When these were put out, why did not the counties and boroughs choose others in their places?

A.

They could not do that without order from the House.

After this they constituted a council of forty persons, which they termed a Council of State, whose office was to execute what the Rump should command.

B.

When there was neither King nor House of Lords, they could not call themselves a Parliament; for a Parliament is a meeting of the King, Lords, and Commons, to confer together about the businesses of the commonwealth. With whom did the Rump confer?

A.

Men may give to their assembly what name they please, what signification soever such name might formerly have had; and the Rump took the name of Parliament, as most suitable to their purpose, and such a name, as being venerable amongst the people for many hundred years, had countenanced and sweetened subsidies and other levies of money, otherwise very unpleasant to the subject. They took also afterwards another name, which was Custodes Libertatis Angliæ, which title they used only in their writs issuing out of the courts of justice.

B.

I do not see how a subject that is tied to the laws, can have more liberty in one form of government than another.

A.

Howsoever to the people, that understand by liberty nothing but leave to do what they list, it was a title not ingrateful.

Their next work was to set forth a public declaration, that they were fully resolved to maintain the fundamental laws of the nation, as to the preservation of the lives, liberties, and proprieties of the people.

B.

What did they mean by the fundamental laws of the nation?

A.

Nothing but to abuse the people. For the only fundamental law in every commonwealth, is to obey the laws from time to time, which he shall make to whom the people have given the supreme power. How likely then are they to uphold the fundamental laws, that had murdered him who was by themselves so often acknowledged for their lawful sovereign? Besides, at the same time that this declaration came forth, they were erecting that High Court of Justice which took away the lives of Duke Hamilton, the Earl of Holland, and the Lord Capel. Whatsoever they meant by a fundamental law, the erecting of this court was a breach of it, as being warranted by no former law or example in England.

At the same time also they levied taxes by soldiers, and to soldiers permitted free quarter, and did many other actions, which if the King had done, they would have said had been done against the liberty and propriety of the subject.

B.

What silly things are the common sort of people, to be cozened as they were so grossly!

A.

What sort of people, as to this matter, are not of the common sort? The craftiest knaves of all the Rump were no wiser than the rest whom they cozened. For the most of them did believe that the same things which they imposed upon the generality, were just and reasonable; and especially the great haranguers, and such as pretended to learning. For who can be a good subject in a monarchy, whose principles are taken from the enemies of monarchy, such as were Cicero, Seneca, Cato, and other politicians of Rome, and Aristotle of Athens, who seldom spake of kings but as of wolves and other ravenous beasts? You may perhaps think a man has need of nothing else to know the duty he owes to his governor, and what right he has to order him, but a good natural wit; but it is otherwise. For it is a science, and built upon sure and clear principles, and to be learned by deep and careful study, or from masters that have deeply studied it. And who was there in the Parliament or in the nation, that could find out those evident principles, and derive from them the necessary rules of justice, and the necessary connexion of justice and peace? The people have one day in seven the leisure to hear instruction, and there are ministers appointed to teach them their duty. But how have those ministers performed their office? A great part of them, namely, the Presbyterian ministers, throughout the whole war, instigated the people against the King; so did also Independents and other fanatic ministers. The rest, contented with their livings, preached in their parishes points of controversy, to religion impertinent, but to the breach of charity among themselves very effectual; or else eloquent things, which the people either understood not, or thought themselves not concerned in. But this sort of preachers, as they did little good, so they did little hurt. The mischief proceeded wholly from the

Presbyterian preachers, who, by a long practised histrionic faculty, preached up the rebellion powerfully.

B.

To what end?

A.

To the end that the State becoming popular, the Church might be so too, and governed by an Assembly; and by consequence, as they thought, seeing politics are subservient to religion, they might govern, and thereby satisfy not only their covetous humour with riches, but also their malice with power to undo all men that admired not their wisdom. Your calling the people silly things, obliged me by this digression to show you, that it is not want of wit, but want of the science of justice, that brought them into these troubles. Persuade, if you can, that man that has made his fortune, or made it greater, or an eloquent orator, or a ravishing poet, or a subtle lawyer, or but a good hunter or a cunning gamester, that he has not a good wit; and yet there were of all these a great many so silly, as to be deceived by the Rump and members of the same Rump. They wanted not wit, but the knowledge of the causes and grounds upon which one person has a right to govern, and the rest an obligation to obey; which grounds are necessary to be taught the people, who without them cannot live long in peace amongst themselves.

B.

Let us return, if you please, to the proceedings of the Rump.

A.

In the rest of this year they voted a new stamp for the coin of this nation. They considered also of agents to be sent to foreign states; and having lately received applause from the army for their work done by the High Court of Justice, and encouragement to extend the same further, they perfected the said High Court of Justice, in which were tried Duke Hamilton, the Earl of Holland, Lord Capel, the Earl of Norwich, and Sir John Owen; whereof, as I mentioned before, the three first were beheaded. This affrighted divers of the King's party out of the land; for not only they, but all that had borne arms for the King, were at that time in very great danger of their lives. For it was put to the question by the army at a council of war, whether they should be all massacred or no; where the noes carried it but by two voices. Lastly, March the 24th, they put the Mayor of London out of his office, fined him 2,000l., disfranchised him, and condemned him to two months imprisonment in the Tower, for refusing to proclaim the act for abolishing the kingly power. And thus ended the year 1648 and the monthly fast; God having granted that which they fasted for, the death of the King and the possession of his inheritance. By these their proceedings they had already lost the hearts of the generality of the people, and had nothing to trust to but the army; which was not in their power, but in Cromwell's; who never failed, when there was occasion, to put them upon all exploits that might make them odious to the people, in order to his future dissolving them whensoever it should conduce to his ends.

In the beginning of 1649 the Scots, discontented with the proceedings of the Rump against the late King, began to levy soldiers in order to a new invasion of England. The Irish rebels, for want of timely resistance from England, were grown terrible; and the English army at home, infected by the adjutators, were casting how to share the land amongst the godly,

meaning themselves and such others as they pleased, who were therefore called Levellers. Also the Rump for the present were not very well provided of money, and, therefore, the first thing they did, was the laying of a tax upon the people of 90,000l. a month for the maintenance of the army.

B.

Was it not one of their quarrels with the King, that he had levied money without the consent of the people in Parliament?

A.

You may see by this, what reason the Rump had to call itself a Parliament. For the taxes imposed by Parliament were always understood to be by the people's consent, and consequently legal. To appease the Scots, they sent messengers with flattering letters to keep them from engaging for the present King: but in vain: for they would hear nothing from a House of Commons, as they called it, at Westminster, without a King and Lords. But they sent commissioners to the King, to let him know what they were doing for him: for they were resolved to raise an army of 17,000 foot and 6,000 horse for themselves. To relieve Ireland, the Rump had resolved to send eleven regiments thither out of the army in England. This happened well for Cromwell. For the levelling soldiers, which were in every regiment many, and in some the major part, finding that instead of dividing the land at home they were to venture their lives in Ireland, flatly denied to go; and one regiment, having cashiered their colonel about Salisbury, was marching to join with three regiments more of the same resolution; but both the general and Cromwell falling upon them at Burford, utterly defeated them, and soon after reduced the whole army to their obedience. And

thus another of the impediments to Cromwell's advancement was soon removed. This done, they came to Oxford, and thence to London: and at Oxford, both the general and Cromwell were made doctors of the civil law; and at London, feasted and presented by the city.

B.

Were they not first made masters, and then doctors?

A.

They had made themselves already masters, both of the laws and Parliament. The army being now obedient, the Rump sent over those eleven regiments into Ireland, under the command of Dr. Cromwell, intituled governor of that kingdom, the Lord Fairfax being still general of all the forces, both here and there.

The Marquis, now Duke, of Ormond was the King's lieutenant of Ireland; and the rebels had made a confederacy amongst themselves; and these confederates had made a kind of league with the lieutenant, wherein they agreed, upon liberty given them in the exercise of their religion, to be faithful to and assist the King. To these also were joined some forces raised by the Earls of Castlehaven and Clanricarde and my Lord Inchiquin; so that they were the greatest united strength in the island. But there were amongst them a great many other Papists, that would by no means subject themselves to Protestants; and these were called the Nuntio's party, as the others were called the confederate party. These parties not agreeing, and the confederate party having broken their articles, the lord-lieutenant seeing them ready to besiege him in Dublin, and not able to defend it, did, to preserve the place for the Protestants, surrender it to the Parliament of England; and came over to the King at that time when he was carried from place to place by the

army. From England he went over to the Prince, now King, residing then at Paris.

But the confederates, affrighted with the news that the Rump was sending over an army thither, desired the Prince by letters, to send back my Lord of Ormond, engaging themselves to submit absolutely to the King's authority, and to obey my Lord of Ormond as his lieutenant. And hereupon he was sent back. This was about a year before the going over of Cromwell.

In which time, by the dissensions in Ireland between the confederate party and the Nuntio's party, and discontents about command, this otherwise sufficient power effected nothing; and was at last defeated, August the 2nd, by a sally out of Dublin, which they were besieging. Within a few days after arrived Cromwell, who with extraordinary diligence and horrid executions, in less than a twelvemonth that he stayed there, subdued in a manner the whole nation; having killed or exterminated a great part of them, and leaving his son-in-law Ireton to subdue the rest. But Ireton died there before the business was quite done, of the plague. This was one step more towards Cromwell's exaltation to the throne.

B.

What a miserable condition was Ireland reduced to by the learning of the Roman, as well as England was by the learning of the Presbyterian clergy.

A.

In the latter end of the preceding year the King was come from Paris to the Hague; and shortly after came thither from the Rump their agent Dorislaus, doctor of civil law, who had been employed in the drawing

up of the charge against the late King. But the first night he came, as he was at supper, a company of cavaliers, near a dozen, entered his chamber, killed him, and got away. Not long after also their agent at Madrid, one Ascham, one that had written in defence of his masters, was killed in the same manner. About this time came out two books, one written by Salmasius, a Presbyterian, against the murder of the King; another written by Milton, an English Independent, in answer to it.

B.

I have seen them both. They are very good Latin both, and hardly to be judged which is better; and both very ill reasoning, hardly to be judged which is worse; like two declamations, pro and con, made for exercise only in a rhetoric school by one and the same man. So like is a Presbyterian to an Independent.

A.

In this year the Rump did not much at home; save that in the beginning they made England a free state by an act which runs thus: “Be it enacted and declared by this present Parliament, and by the authority thereof, that the people of England, and all the dominions and territories thereunto belonging, are, and shall be, and are hereby constituted, made, and declared a commonwealth and free state, &c.”

B.

What did they mean by a free state and commonwealth? Were the people no longer to be subject to laws? They could not mean that: for the Parliament meant to govern them by their own laws, and punish such as broke them. Did they mean that England should not be subject

to any foreign kingdom or commonwealth? That needed not be enacted, seeing there was no king nor people pretended to be their masters. What did they mean then?

A.

They meant that neither this king, nor any king, nor any single person, but only that they themselves would be the people's masters, and would have set it down in those plain words, if the people could have been cozened with words intelligible, as easily as with words not intelligible. After this they gave one another money and estates out of the lands and goods of the loyal party. They enacted also an engagement to be taken by every man, in these words: You shall promise to be true and faithful to the commonwealth of England, as it is now established, without King or House of Lords.

They banished also from within twenty miles of London all the royal party, forbidding also every one of them to depart more than five miles from his dwelling-house.

B.

They meant perhaps to have them ready, if need were, for a massacre. But what did the Scots in this time?

A.

They were considering of the officers of the army which they were levying for the King, how they might exclude from command all such as had loyally served his father, and all Independents, and all such as commanded in Duke Hamilton's army; and these were the main things that passed this year.

The Marquis of Montrose, that in the year 1645 had with a few men and in little time done things almost incredible against the late King's enemies in Scotland, landed now again, in the beginning of the year 1650, in the north of Scotland, with commission from the present King, hoping to do him as good service as he had formerly done his father. But the case was altered; for the Scotch forces were then in England in the service of the Parliament; whereas now they were in Scotland, and many more for their intended invasion newly raised. Besides, the soldiers which the Marquis brought over were few, and foreigners; nor did the Highlanders come in to him, as he expected; insomuch as he was soon defeated, and shortly after taken, and, with more spiteful usage than revenge required, executed by the Covenanters of Edinburgh, May the 2nd.

B.

What good could the King expect from joining with these men, who during the treaty discovered so much malice to him in one of his best servants?

A.

No doubt, their churchmen being then prevalent, they would have done as much to this King as the English Parliament had done to his father, if they could have gotten by it that which they foolishly aspired to, the government of the nation. I do not believe that the Independents were worse than the Presbyterians: both the one and the other were resolved to destroy whatsoever should stand in the way to their ambition. But necessity made the King pass over both this and many other indignities from them, rather than suffer the pursuit of his right in England to cool, and be little better than extinguished.

B.

Indeed I believe a kingdom, if suffered to become an old debt, will hardly ever be recovered. Besides, the King was sure, wheresoever the victory lighted, he could lose nothing in the war but enemies.

A.

About the time of Montrose's death, which was in May, Cromwell was yet in Ireland, and his work unfinished. But finding, or by his friends advertised, that his presence in the expedition now preparing against the Scots would be necessary to his design, he sent to the Rump to know their pleasure concerning his return. But for all that, he knew, or thought it was not necessary to stay for their answer, but came away, and arrived at London the 6th of June following, and was welcomed by the Rump. Now General Fairfax, who was truly what he pretended to be, a Presbyterian, had been so catechised by the Presbyterian ministers here, that he refused to fight against the brethren in Scotland; nor did the Rump nor Cromwell go about to rectify his conscience in that point. And thus Fairfax laying down his commission, Cromwell was now made general of all the forces in England and Ireland; which was another step to the sovereign power.

B.

Where was the King?

A.

In Scotland, newly come over. He landed in the north, and was honourably conducted to Edinburgh, though all things were not yet well

agreed on between the Scots and him. For though he had yielded to as hard conditions as the late King had yielded to in the Isle of Wight, yet they had still somewhat to add, till the King, enduring no more, departed from them towards the north again. But they sent messengers after him to pray him to return, but they furnished these messengers with strength enough to bring him back, if he should have refused. In fine they agreed; but would not suffer either the King, or any royalist, to have command in the army.

B.

The sum of all is, the King was there a prisoner.

A.

Cromwell from Berwick sends a declaration to the Scots, telling them he had no quarrel against the people of Scotland, but against the malignant party that had brought in the King, to the disturbance of the peace between the two nations; and that he was willing, either by conference to give and receive satisfaction, or to decide the justice of the cause by battle. To which the Scots answering, declare, that they will not prosecute the King's interest before and without his acknowledgment of the sins of his house and his former ways, and satisfaction given to God's people in both kingdoms. Judge by this whether the present King were not in as bad a condition here, as his father was in the hands of the Presbyterians of England.

B.

Presbyterians are everywhere the same: they would fain be absolute governors of all they converse with; and have nothing to plead for it, but

that where they reign, it is God that reigns, and nowhere else. But I observe one strange demand, that the King should acknowledge the sins of his house; for I thought it had been certainly held by all divines, that no man was bound to acknowledge any man's sins but his own.

A.

The King having yielded to all that the Church required, the Scots proceeded in their intended war. Cromwell marched on to Edinburgh, provoking them all he could to battle; which they declining, and provisions growing scarce in the English army, Cromwell retired to Dunbar, despairing of success; and intending by sea or land to get back into England. And such was the condition which this general Cromwell, so much magnified for conduct, had brought his army to, that all his glories had ended in shame and punishment, if fortune and the faults of his enemies had not relieved him. For as he retired, the Scots followed him close all the way till within a mile of Dunbar. There is a ridge of hills, that from beyond Edinburgh goes winding to the sea, and crosses the highway between Dunbar and Berwick, at a village called Copperspeith, where the passage is so difficult, that had the Scots sent timely thither a very few men to guard it, the English could never have gotten home. For the Scots kept the hills, and needed not have fought but upon great advantage, and were almost two to one. Cromwell's army was at the foot of those hills, on the north side; and there was a great ditch or channel of a torrent between the hills and it; so that he could never have got home by land, nor without utter ruin of the army attempted to ship it; nor have stayed where he was, for want of provisions. Now Cromwell knowing the pass was free, and commanding a good party of horse and foot to possess it, it was necessary for the Scots to let them go, whom they bragged they had

impounded, or else to fight; and therefore with the best of their horse they charged the English, and made them at first shrink a little. But the English foot coming on, the Scots were put to flight; and the flight of the horse hindered the foot from engaging; who therefore fled, as did also the rest of their horse. Thus the folly of the Scottish commanders brought all their odds to an even lay between two small and equal parties; wherein fortune gave the victory to the English, who were not many more in number than those that were killed and taken prisoners of the Scots; and the Church lost their cannon, bag and baggage, with 10,000 arms, and almost their whole army. The rest were got together by Lesley to Stirling.

B.

This victory happened well for the King. For had the Scots been victors, the Presbyterians, both here and there, would have domineered again, and the King been in the same condition his father was in at Newcastle, in the hands of the Scottish army. For in pursuit of this victory, the English at last brought the Scots to a pretty good habit of obedience for the King, whensoever he should recover his right.

A.

In pursuit of this victory the English marched to Edinburgh (quitted by the Scots), fortified Leith, and took in all the strength and castles they thought fit on this side the Frith, which now was become the bound betwixt the two nations. And the Scotch ecclesiastics began to know themselves better; and resolved in their new army, which they meant to raise, to admit some of the royalists into command. Cromwell from Edinburgh marched towards Stirling, to provoke the enemy to fight, but finding danger in it returned to Edinburgh and besieged the castle. In the

meantime he sent a party into the west of Scotland to suppress Strachan and Kerr, two great Presbyterians that were there levying forces for their new army. And in the same time the Scots crowned the King at Scone. The rest of this year was spent in Scotland, on Cromwell's part, in taking of Edinburgh Castle and in attempts to pass the Frith, or any other ways to get over to the Scottish forces; and on the Scots' part, in hastening their levies for the north.

B.

What did the Rump at home during this time?

A.

They voted liberty of conscience to the sectaries; that is, they plucked out the sting of Presbytery, which consisted in a severe imposing of odd opinions upon the people, impertinent to religion, but conducing to the advancement of the power of the Presbyterian ministers. Also they levied more soldiers, and gave the command of them to Harrison, now made major-general, a Fifth-monarchy-man; and of these soldiers two regiments of horse and one of foot were raised by the Fifth-monarchy-men and other sectaries, in thankfulness for this their liberty from the Presbyterian tyranny. Also they pulled down the late King's statue in the Exchange, and in the niche where it stood, caused to be written these words: Exit tyrannus, Regum ultimus, etc.

B.

What good did that do them, and why did they not pull down the statues of all the rest of the Kings?

A.

What account can be given of actions that proceed not from reason, but spite and such-like passions? Besides this, they received ambassadors from Portugal and from Spain, acknowledging their power. And in the very end of the year they prepared ambassadors to the Netherlands to offer them friendship. All they did besides, was persecuting and executing of royalists.

In the beginning of the year 1651 General Dean arrived in Scotland; and on the 11th of April the Scottish Parliament assembled, and made certain acts in order to a better uniting of themselves, and better obedience to the King, who was now at Stirling with the Scottish forces he had, expecting more now in levying. Cromwell from Edinburgh went divers times towards Stirling to provoke the Scots to fight. There was no ford there to pass over his men; at last boats being come from London and Newcastle, Colonel Overton (though it was long first, for it was now July) transported 1,400 foot of his own, besides another regiment of foot and four troops of horse, and entrenched himself at Northferry on the other side; and before any help could come from Stirling, Major-General Lambert also was got over with as many more. By this time Sir John Browne was come to oppose them with 4,500 men, whom the English there defeated, killing about 2,000 and taking prisoners 1,600. This done, and as much more of the army transported as was thought fit, Cromwell comes before St. Johnstone's (from whence the Scottish Parliament, upon the news of his passing the Frith, was removed to Dundee) and summons it; and the same day had news brought him that the King was marching from Stirling towards England; which was true. But notwithstanding the King was three days' march before him, he resolved to have the town before he followed him; and accordingly had it the next day by surrender.

B.

What hopes had the King in coming into England, having before and behind him none, at least none armed, but his enemies?

A.

Yes; there was before him the city of London, which generally hated the Rump, and might easily be reckoned for 20,000 well-armed soldiers; and most men believed they would take his part, had he come near the city.

B.

What probability was there of that? Do you think the Rump was not sure of the services of the mayor and those that had command of the city militia? And if they had been really the King's friends, what need had they to stay for his coming up to London? They might have seized the Rump, if they had pleased, which had no possibility of defending themselves; at least they might have turned them out of the House.

A.

This they did not; but on the contrary, permitted the recruiting of Cromwell's army, and the raising of men to keep the country from coming in to the King. The King began his march from Stirling the last of July, and August the 22nd came to Worcester by way of Carlisle with a weary army of about 13,000, whom Cromwell followed, and joining with the new levies environed Worcester with 40,000, and on the 3rd of September utterly defeated the King's army. Here Duke Hamilton, brother of him that was beheaded, was slain.

B.

What became of the King?

A.

Night coming on, before the city was quite taken he left it; it being dark and none of the enemy's horse within the town to follow him, the plundering foot having kept the gates shut, lest the horse should enter and have a share of the booty. The King before morning got into Warwickshire, twenty-five miles from Worcester, and there lay disguised awhile, and afterwards went up and down in great danger of being discovered, till at last he got over into France, from Brighthelmstone in Sussex.

B.

When Cromwell was gone, what was further done in Scotland?

A.

Lieutenant-General Monk, whom Cromwell left there with 7,000, took Stirling August 14th by surrender, and Dundee the 3rd of September, by storm, because it resisted. This the soldiers plundered, and had good booty, because the Scots for safety had sent thither their most precious goods from Edinburgh and St. Johnstone's. He took likewise by surrender Aberdeen, and the place where the Scottish ministers first learned to play the fool, St. Andrew's. Also in the Highlands, Colonel Alured took a knot of lords and gentlemen, viz. four earls and four lords and above twenty knights and gentlemen, whom he sent prisoners into England. So that there was nothing more to be feared from Scotland: all

the trouble of the Rump being to resolve what they should do with it. At last they resolved to unite and incorporate it into one commonwealth with England and Ireland. And to that end sent thither St. John, Vane, and other commissioners, to offer them this union by public declaration, and to warn them to choose their deputies of shires and burgesses of towns, and send them to Westminster.

B.

This was a very great favour.

A.

I think so: and yet it was by many of the Scots, especially by the ministers and other Presbyterians, refused. The ministers had given way to the levying of money for the payment of the English soldiers; but to comply with the declaration of the English commissioners they absolutely forbade.

B.

Methinks this contributing to the pay of their conquerors was some mark of servitude; whereas entering into the union made them free, and gave them equal privilege with the English.

A.

The cause why they refused the union, rendered by the Presbyterians themselves, was this: that it drew with it a subordination of the Church to the civil state in the things of Christ.

B.

This is a downright declaration to all kings and commonwealths in general, that a Presbyterian minister will be a true subject to none of them in the things of Christ; which things what they are, they will be judges themselves. What have we then gotten by our deliverance from the Pope's tyranny, if these petty men succeed in the place of it, that have nothing in them that can be beneficial to the public, except their silence? For their learning, it amounts to no more than an imperfect knowledge of Greek and Latin, and an acquired readiness in the Scripture language, with a gesture and tone suitable thereunto; but of justice and charity, the manners of religion, they have neither knowledge nor practice, as is manifest by the stories I have already told you. Nor do they distinguish between the godly and the ungodly but by conformity of design in men of judgment, or by repetition of their sermons in the common sort of people.

A.

But this sullenness of the Scots was to no purpose. For they at Westminster enacted the union of the two nations and the abolition of monarchy in Scotland, and ordained punishment for those that should transgress that act.

B.

What other business did the Rump this year?

A.

They sent St. John and Strickland ambassadors to the Hague, to offer league to the United Provinces; who had audience March the 3rd; St. John in a speech showing those states what advantage they might have

by this league in their trade and navigations, by the use of the English ports and harbours. The Dutch, though they showed no great forwardness in the business, yet appointed commissioners to treat with them about it. But the people were generally against it, calling the ambassadors and their followers, as they were, traitors and murderers, and made such tumults about their house that their followers durst not go abroad till the States had quieted them. The Rump advertised hereof, presently recalled them. The compliment which St. John gave to the commissioners at their taking leave, is worth your hearing. You have, said he, an eye upon the event of the affairs of Scotland, and therefore do refuse the friendship we have offered. Now I can assure you, many in the Parliament were of opinion that we should not have sent any ambassadors to you till we had separated those matters between them and that king, and then expected your ambassadors to us. I now perceive our error, and that those gentlemen were in the right. In a short time you shall see that business ended; and then you will come and seek what we have freely offered, when it shall perplex you that you have refused our proffer.

B.

St. John was not sure that the Scottish business would end as it did. For though the Scots were beaten at Dunbar, he could not be sure of the event of their entering England, which happened afterward.

A.

But he guessed well: for within a month after the battle at Worcester, an act passed forbidding the importing of merchandize in other than English ships. The English also molested their fishing upon our coast. They also many times searched their ships (upon occasion of our war

with France), and made some of them prize. And then the Dutch sent their ambassadors hither to desire what they before refused; but partly also to inform themselves what naval forces the English had ready, and how the people here were contented with the government.

B.

How sped they?

A.

The Rump showed now as little desire of agreement as the Dutch did then; standing upon terms never likely to be granted. First, for the fishing on the English coast, that they should not have it without paying for it. Secondly, that the English should have free trade from Middleburgh to Antwerp, as they had before their rebellion against the King of Spain. Thirdly, they demanded amends for the old, but never to be forgotten business of Amboyna. So that the war was already certain, though the season kept them from action till the spring following. The true quarrel, on the English part, was that their proffered friendship was scorned, and their ambassadors affronted; on the Dutch part, was their greediness to engross all traffic, and a false estimate of our and their own strength.

Whilst these things were doing, the relics of the war, both in Ireland and Scotland, were not neglected, though those nations were not fully pacified till two years after. The persecution also of royalists still continued, amongst whom was beheaded one Mr. Love, for holding correspondence with the King.

B.

I had thought a Presbyterian minister, whilst he was such, could not be a royalist, because they think their assembly have the supreme power in the things of Christ; and by consequence they are in England, by a statute, traitors.

A.

You may think so still: for though I called Mr. Love a royalist, I meant it only for that one act for which he was condemned. It was he who during the treaty at Uxbridge, preaching before the commissioners there, said, it was as possible for heaven and hell, as for the King and Parliament, to agree. Both he and the rest of the Presbyterians are and were enemies to the King's enemies, Cromwell and his fanatics, for their own and not for the King's sake. Their loyalty was like that of Sir John Hotham's, that kept the King out of Hull, and afterwards would have betrayed the same to the Marquis of Newcastle. These Presbyterians therefore cannot be rightly called loyal, but rather doubly perfidious, unless you think that as two negatives make an affirmative, so two treasons make loyalty.

This year also were reduced to the obedience of the Rump the islands of Scilly and Man, and the Barbadoes, and St. Christopher's. One thing fell out that they liked not, which was, that Cromwell gave them warning to determine their sitting, according to the bill for triennial Parliaments.

B.

That I think indeed was harsh.

A.

In the year 1652, May the 14th, began the Dutch war, in this manner. Three Dutch men-of-war, with divers merchants from the straights,

being discovered by one Captain Young, who commanded some English frigates, the said Young sent to their admiral to bid him strike his flag, a thing usually done in acknowledgment of the English dominion in the narrow seas; which accordingly he did. Then came up the vice-admiral, and being called to as the other was, to take down his flag, he answered plainly he would not: but after the exchange of four or five broadsides and mischief done on either part, he took it down. But Captain Young demanded also, either the vice-admiral himself or his ship to make good the damage already sustained; to which the vice-admiral answered that he had taken in his flag, but would defend himself and his ship. Whereupon Captain Young consulting with the captains of his other ships, lest the beginning of the war in this time of treaty should be charged upon himself, and night also coming on, thought fit to proceed no further.

B.

The war certainly began at this time. But who began it?

A.

The dominion of the seas belonging to the English, there can be no question but the Dutch began it: and that the said dominion belonged to the English, it was confessed at first by the admiral himself peaceably, and at last by the vice-admiral taking in their flags.

About a fortnight after there happened another fight upon the like occasion. Van Tromp, with forty-two men-of-war, came to the back of Goodwin Sands, Major Bourne being then with a few of the Parliament ships in the Downs, and Blake with the rest further westward; and sent two captains of his to Bourne, to excuse his coming thither. To whom Bourne returned this answer, that the message was civil, but that it

might appear real he ought to depart. So Van Tromp departed, meaning, now Bourne was satisfied, to sail towards Blake, and he did so; but so did also Bourne, for fear of the worst. When Van Tromp and Blake were near one another, Blake made a shot over Van Tromp's ship, as a warning to him to take in his flag. This he did thrice, and then Van Tromp gave him a broadside; and so began the fight, (at the beginning whereof Bourne came in), and lasted from two o'clock till night, the English having the better, and the flag, as before, making the quarrel.

B.

What needs there, when both nations were heartily resolved to fight, to stand so much upon this compliment of who should begin? For as to the gaining of friends and confederates thereby, I think it was in vain; seeing princes and states in such occasions look not much upon the justice of their neighbours, but upon their own concernment in the event.

A.

It is commonly so; but in this case, the Dutch knowing the dominion of the narrow seas to be a gallant title, and envied by all the nations that reach the shore, and consequently that they were likely to oppose it, did wisely enough in making this point the state of the quarrel. After this fight the Dutch ambassadors residing in England sent a paper to the council of state, wherein they styled this last encounter a rash action, and affirmed it was done without the knowledge and against the will of their lords the States-general, and desired them that nothing might be done upon it in heat, which might become irreparable. The Parliament hereupon voted: 1. That the States-general should pay the charges they were at, and for the damages they sustained upon this occasion. 2. That

this being paid, there should be a cessation of all acts of hostility, and a mutual restitution of all ships and goods taken. 3. And both these agreed to, that there should be made a league between the two commonwealths. These votes were sent to the Dutch ambassadors in answer of the said paper; but with a preamble setting forth the former kindnesses of England to the Netherlands, and taking notice of their new fleet of 150 men-of-war, without any other apparent design than the destruction of the English fleet.

B.

What answer made the Dutch to this?

A.

None. Van Tromp sailed presently to Zealand, and Blake with seventy men-of-war to the Orkney Islands to seize their busses, and to wait for five Dutch ships from the East Indies. And Sir George Askew, newly returned from the Barbadoes, came into the Downs with fifteen men-of-war, where he was commanded to stay for a recruit out of the Thames. Van Tromp being recruited now to 120 sail, made account to get in between Sir George Askew and the mouth of the river, but was hindered so long by contrary winds, that the merchants calling for his convoy he could stay no longer; and so he went back into Holland, and thence to Orkney, where he met with the said five East India ships and sent them home. And then he endeavoured to engage with Blake, but a sudden storm forced him to sea, and so dissipated his fleet that only forty-two came home in a body, the rest singly as well as they could. Blake also came home (but went first to the coast of Holland) with 900 prisoners and six men-of-war taken, which were part of twelve which he found

and took guarding their busses. This was the first bout after the war declared.

In August following there happened a fight between De Ruyter, the admiral of Zealand, with fifty men-of-war, and Sir George Askew, near Plymouth, with forty, wherein Sir George had the better, and might have got an entire victory had the whole fleet engaged. Whatsoever was the matter, the Rump, though they rewarded him, never more employed him after his return in their service at sea: but voted for the year to come three generals, Blake that was one already, and Dean, and Monk.

About this time the Archduke Leopold besieging Dunkirk, and the French sending a fleet to relieve it, General Blake lighting on the French at Calais, and taking seven of their ships, was cause of the town's surrender.

In September they fought again, De Witt and De Ruyter commanding the Dutch, and Blake the English; and the Dutch were again worsted.

Again, in the end of November, Van Tromp with eighty men-of-war shewed himself at the back of Goodwin Sands; where Blake, though he had with him but forty, adventured to fight with him, and had much the worst, and night parting the fray, retired into the river Thames; whilst Van Tromp keeping the sea, took some inconsiderable vessels from the English, and thereupon, as it was said, with a childish vanity hung out a broom from the main-top-mast, signifying he meant to sweep the seas of all English shipping.

After this, in February, the Dutch with Van Tromp were encountered by the English under Blake and Dean near Portsmouth, and had the worst. And these were all the encounters between them in this year in the narrow seas. They fought also once at Leghorn, where the Dutch had the better.

B.

I see no great odds yet on either side; if there were any, the English had it.

A.

Nor did either of them the more incline to peace. For the Hollanders, after they had sent ambassadors into Denmark, Sweden, Poland, and the Hanse Towns whence tar and cordage are usually had, to signify the declaration of the war, and to get them to their party, recalled their ambassadors from England. And the Rump without delay, gave them their parting audience, without abating a syllable of their former severe propositions; and presently, to maintain the war for the next year, laid a tax upon the people of 120,000l. per mensem.

B.

What was done in the mean time at home?

A.

Cromwell was now quarrelling with the last and greatest obstacle to his design, the Rump. And to that end there came out daily from the army petitions, addresses, remonstrances, and other such papers; some of them urging the Rump to dissolve themselves and make way for another Parliament. To which the Rump, unwilling to yield and not daring to refuse, determined for the end of their sitting the 5th of November 1654. But Cromwell meant not to stay so long.

In the meantime the army in Ireland was taking submissions, and granting transportations of the Irish, and condemning whom they pleased in a High Court of Justice erected there for that purpose. Amongst those that were executed, was hanged Sir Phelim O'Neale,

who first began the rebellion. In Scotland the English built some citadels for the bridling of that stubborn nation. And thus ended the year 1652.

B.

Come we then to the year 1653.

A.

Cromwell wanted now but one step to the end of his ambition, and that was to set his foot upon the neck of this Long Parliament; which he did April the 23rd of this present year 1653, a time very seasonable. For though the Dutch were not mastered yet, they were much weakened; and what with prizes from the enemy and squeezing the royal party, the treasury was pretty full, and the tax of 120,000l. a month began to come in; all which was his own in right of the army.

Therefore, without more ado, attended by the Major-Generals Lambert and Harrison, and some other officers, and as many soldiers as he thought fit, he went to the Parliament House, and dissolved them, turning them out, and locked up the doors. And for this action he was more applauded by the people than for any of his victories in the war, and the Parliament men as much scorned and derided.

B.

Now that there was no Parliament, who had the supreme power?

A.

If by power you mean the right to govern, nobody had it. If you mean the supreme strength, it was clearly in Cromwell, who was obeyed as

general of all the forces in England, Scotland, and Ireland.

B.

Did he pretend that for title?

A.

No: but presently after he invented a title, which was this; that he was necessitated for the defence of the cause, for which at first the Parliament had taken up arms, that is to say, rebelled, to have recourse to extraordinary actions. You know the pretence of the Long Parliament's rebellion was *salus populi*, the safety of the nation against a dangerous conspiracy of Papists and a malignant party at home; and that every man is bound, as far as his power extends, to procure the safety of the whole nation, which none but the army were able to do, and the Parliament had hitherto neglected. Was it not then the general's duty to do it? Had he not therefore right? For that law of *salus populi* is directed only to those that have power enough to defend the people; that is, to them that have the supreme power.

B.

Yes, certainly, he had as good a title as the Long Parliament. But the Long Parliament did represent the people; and it seems to me that the sovereign power is essentially annexed to the representative of the people.

A.

Yes, if he that makes a representative, that is in the present case the King, do call them together to receive the sovereign power, and he

divest himself thereof; otherwise not. Nor was ever the Lower House of Parliament the representative of the whole nation, but of the commons only; nor had that House the power to oblige by their acts or ordinances, any lord or any priest.

B.

Did Cromwell come in upon the only title of *salus populi*?

A.

This is a title that very few men understand. His way was to get the supreme power conferred upon him by Parliament. Therefore he called a Parliament, and gave it the supreme power, to the end that they should give it to him again. Was not this witty? First, therefore, he published a declaration of the causes why he dissolved the Parliament. The sum whereof was, that instead of endeavouring to promote the good of God's people, they endeavoured, by a bill then ready to pass, to recruit the House and perpetuate their own power. Next he constituted a council of state of his own creatures, to be the supreme authority of England; but no longer than till the next Parliament should be called and met. Thirdly, he summoned 142 persons, such as he himself or his trusty officers made choice of; the greatest part of whom were instructed what to do; obscure persons, and most of them fanatics, though styled by Cromwell men of approved fidelity and honesty. To these the council of state surrendered the supreme authority, and not long after these men surrendered it to Cromwell. July the 4th this Parliament met, and chose for their Speaker one Mr. Rous, and called themselves from that time forward the Parliament of England. But Cromwell, for the more surety, constituted also a council of state; not of such petty fellows as most of these were, but of himself and his principal officers. These did all the

business, both public and private; making ordinances, and giving audiences to foreign ambassadors. But he had now more enemies than before. Harrison, who was the head of the Fifth-monarchy-men, laying down his commission, did nothing but animate his party against him; for which afterwards he was imprisoned. This little Parliament in the meantime were making of acts so ridiculous and displeasing to the people, that it was thought he chose them on purpose to bring all ruling Parliaments into contempt, and monarchy again into credit.

B.

What acts were these?

A.

One of them was, that all marriages should be made by a justice of peace, and the banns asked three several days in the next market: none were forbidden to be married by a minister, but without a justice of peace the marriage was to be void: so that divers wary couples, to be sure of one another, howsoever they might repent it afterwards, were married both ways. Also they abrogated the engagement, whereby no man was admitted to sue in any court of law that had not taken it, that is, that had not acknowledged the late Rump.

B.

Neither of these did any hurt to Cromwell.

A.

They were also in hand with an act to cancel all the present laws and law-books, and to make a new code more suitable to the humour of the

Fifth-monarchy-men; of whom there were many in this Parliament. Their tenet being, that there ought none to be sovereign but King Jesus, nor any to govern under him but the saints. But their authority ended before this act passed.

B.

What is this to Cromwell?

A.

Nothing yet. But they were likewise upon an act, now almost ready for the question, that Parliaments henceforward, one upon the end of another, should be perpetual.

B.

I understand not this; unless Parliaments can beget one another like animals, or like the phoenix.

A.

Why not like the phoenix? Cannot a Parliament at the day of their expiration send out writs for a new one?

B.

Do you think they would not rather summon themselves anew; and to save the labour of coming again to Westminster, sit still where they were? Or if they summon the country to make new elections, and then dissolve themselves, by what authority shall the people meet in their county courts, there being no supreme authority standing?

A.

All they did was absurd, though they knew not that; no nor this, whose design was upon the sovereignty, the contriver of this act, it seems, perceived not; but Cromwell's party in the House saw it well enough. And therefore, as soon as it was laid, there stood up one of the members and made a motion, that since the commonwealth was like to receive little benefit by their sitting, they should dissolve themselves. Harrison and they of his sect were troubled hereat, and made speeches against it; but Cromwell's party, of whom the speaker was one, left the House, and with the mace before them went to Whitehall, and surrendered their power to Cromwell that had given it to them. And so he got the sovereignty by an act of Parliament; and within four days after, December the 16th, was installed Protector of the three nations, and took his oath to observe certain rules of governing, engrossed in parchment and read before him. The writing was called the instrument.

B.

What were the rules he swore to?

A.

One was, to call a Parliament every third year, of which the first was to begin September the 3rd following.

B.

I believe he was a little superstitious in the choice of September the 3rd, because it was lucky to him in 1650 and 1651, at Dunbar and Worcester;

but he knew not how lucky the same would be to the whole nation in 1658 at Whitehall.

A.

Another was, that no Parliament should be dissolved till it had sitten five months; and those bills that they presented to him, should be passed by him within twenty days, or else they should pass without him.

A third, that he should have a council of state of not above twenty-one, nor under thirteen; and that upon the Protector's death this council should meet, and before they parted choose a new Protector. There were many more besides, but not necessary to be inserted.

B.

How went on the war against the Dutch?

A.

The generals for the English were Blake, and Dean, and Monk; and Van Tromp for the Dutch; between whom was a battle fought the 2nd of June, which was a month before the beginning of this little Parliament; wherein the English had the victory, and drove the enemies into their harbours, but with the loss of General Dean, slain by a cannon-shot. This victory was great enough to make the Dutch send over ambassadors into England, in order to a treaty; but in the meantime they prepared and put to sea another fleet, which likewise, in the end of July, was defeated by General Monk, who got now a greater victory than before; and this made the Dutch descend so far as to buy their peace with the payment of the charge of the war, and with the

acknowledgment, amongst other articles, that the English had the right of the flag.

This peace was concluded in March, being the end of this year, but not proclaimed till April; the money, it seems, being not paid till then.

The Dutch war being now ended, the Protector sent his youngest son Henry into Ireland, whom also some time after he made lieutenant there; and sent Monk lieutenant-general into Scotland, to keep those nations in obedience. Nothing else worth remembering was done this year at home; saving the discovery of a plot of royalists, as was said, upon the life of the Protector, who all this while had intelligence of the King's designs from a traitor in his court, who afterwards was taken in the manner and killed.

B.

How came he into so much trust with the King?

A.

He was the son of a colonel that was slain in the wars on the late King's side. Besides, he pretended employment from the King's loyal and loving subjects here, to convey to his Majesty money as they from time to time should send him; and to make this credible, Cromwell himself caused money to be sent to him.

The following year, 1654, had nothing of war, but was spent in civil ordinances, in appointing of judges, preventing of plots (for usurpers are jealous), and in executing the King's friends and selling their lands. The 3rd of September, according to the instrument, the Parliament met; in which there was no House of Lords, and the House of Commons was made, as formerly, of knights and burgesses; but not as formerly, of two burgesses for a borough and two knights for a county; for boroughs for

the most part had but one burgess, and some counties six or seven knights. Besides, there were twenty members for Scotland, and as many for Ireland. So that now Cromwell had nothing else to do but to show his art of government upon six coach-horses newly presented to him, which, being as rebellious as himself, threw him out of the coach-box and almost killed him.

B.

This Parliament, which had seen how Cromwell had handled the two former, the long one and the short one, had surely learned the wit to behave themselves better to him than those had done?

A.

Yes, especially now that Cromwell in his speech at their first meeting had expressly forbidden them to meddle either with the government by a single person and Parliament, or with the militia, or with perpetuating of Parliaments, or taking away liberty of conscience; and told them also that every member of the House, before they sat, must take a recognition of his power in divers points. Whereupon, of above 400 there appeared not above 200 at first; though afterwards some relenting, there sat about 300. Again, just at their sitting down he published some ordinances of his own, bearing date before their meeting; that they might see he took his own acts to be as valid as theirs. But all this could not make them know themselves. They proceeded to debate of every article of the recognition.

B.

They should have debated that before they had taken it.

A.

But then they had never been suffered to sit. Cromwell being informed of their stubborn proceedings, and out of hope of any supply from them, dissolved them.

All that passed besides in this year, was the exercise of the High Court of Justice upon some royalists for plots.

In the year 1655 the English, to the number of near 10,000, landed in Hispaniola, in hope of the plunder of the gold and silver, whereof they thought there was great abundance in the town of Santo Domingo; but were well beaten by a few Spaniards, and with the loss of near 1,000 men, went off to Jamaica and possessed it.

This year also the royal party made another attempt in the west; and proclaimed there King Charles the Second; but few joining with them, and some falling off, they were soon suppressed, and many of the principal persons executed.

B.

In these many insurrections, the royalists, though they meant well, yet they did but disservice to the King by their impatience. What hope had they to prevail against so great an army as the Protector had ready? What cause was there to despair of seeing the King's business done better by the dissension and ambition of the great commanders in that army, whereof many had the favour to be as well esteemed amongst them as Cromwell himself?

A.

That was somewhat uncertain. The Protector, being frustrated of his hope of money at Santo Domingo, resolved to take from the royalists

the tenth part yearly of their estates. And to this end chiefly, he divided England into eleven major-generalships, with commission to every major-general to make a roll of the names of all suspected persons of the King's party, and to receive the tenth part of their estates within his precinct; as also to take caution from them not to act against the state, and to reveal all plots that should come to their knowledge; and to make them engage the like for their servants. They had commission also to forbid horse-races and concourse of people, and to receive and account for this decimation.

B.

By this the usurper might easily inform himself of the value of all the estates in England, and of the behaviour and affection of every person of quality; which has heretofore been taken for very great tyranny.

A.

The year 1656 was a Parliament-year by the instrument. Between the beginning of this year and the day of the Parliament's sitting, which was September 17, these major-generals, resided in several provinces, behaving themselves most tyrannically. Amongst other of their tyrannies was the awing of elections, and making themselves and whom they pleased to be returned members for the Parliament; which was also thought a part of Cromwell's design in their constitution: for he had need of a giving Parliament, having lately, upon a peace made with the French, drawn upon himself a war with Spain.

This year it was that Captain Stainer set upon the Spanish Plate-fleet, being eight in number, near Cadiz; whereof he sunk two, and took two, there being in one of them two millions of pieces of eight, which amounts to 400,000l. sterling.

This year also it was that James Naylor appeared at Bristol, and would be taken for Jesus Christ. He wore his beard forked, and his hair composed to the likeness of that in the Volto Santo; and being questioned, would sometimes answer Thou sayest it. He had also his disciples, that would go by his horse's side to the mid-leg in dirt. Being sent for by the Parliament, he was sentenced to stand on the pillory, to have his tongue bored through, and to be marked on the forehead with the letter B, for blasphemy, and to remain in Bridewell. Lambert, a great favourite of the army, endeavoured to save him, partly because he had been his soldier, and partly to curry favour with the sectaries of the army; for he was now no more in the Protector's favour, but meditating how he might succeed him in his power.

About two years before this, there appeared in Cornwall a prophetess, much famed for her dreams and visions, and hearkened to by many, whereof some were eminent officers. But she and some of her accomplices being imprisoned, we heard no more of her.

B.

I have heard of another, one Lilly, that prophecied all the time of the Long Parliament. What did they to him?

A.

His prophecies were of another kind; he was a writer of almanacs, and a pretender to a pretended art of judicial astrology; a meer cozener to get maintenance from a multitude of ignorant people; and no doubt had been called in question, if his prophecies had been any way disadvantageous to that Parliament.

B.

I understand not how the dreams and prognostications of madmen (for such I take to be all those that foretell future contingencies) can be of any great disadvantage to the commonwealth.

A.

Yes, yes: know, there is nothing that renders human counsels difficult, but the uncertainty of future time; nor that so well directs men in their deliberations, as the foresight of the sequels of their actions; prophecy being many times the principal cause of the event foretold. If, upon some prediction, the people should have been made confident that Oliver Cromwell and his army should be, upon a day to come, utterly defeated; would not every one have endeavoured to assist, and to deserve well of the party that should give him that defeat? Upon this account it was that fortune-tellers and astrologers were so often banished out of Rome.

The last memorable thing this year, was a motion made by a member of the House, an alderman of London, that the Protector might be petitioned and advised by the House to leave the title of Protector, and take upon him that of King.

B.

That was indeed a bold motion, and which would, if prosperous, have put an end to many men's ambition, and to the licentiousness of the whole army. I think the motion was made on purpose to ruin both the Protector himself and his ambitious officers.

A.

It may be so. In the year 1657 the first thing the Parliament did, was the drawing up of this petition to the Protector, to take upon him the government of the three nations, with the title of King. As of other Parliaments, so of this, the greatest part had been either kept out of the House by force, or else themselves had forborne to sit and become guilty of setting up this King Oliver. But those few that sat, presented their petition to the Protector, April the 9th, in the Banqueting-house at Whitehall; where Sir Thomas Widdrington, the Speaker, used the first arguments, and the Protector desired some time to seek God, the business being weighty. The next day they sent a committee to him to receive his answer; which answer being not very clear, they pressed him again for a resolution; to which he made answer in a long speech, that ended in a peremptory refusal. And so retaining still the title of Protector, he took upon him the government according to certain articles contained in the said petition.

B.

What made him refuse the title of King?

A.

Because he durst not take it at that time; the army being addicted to their great officers, and amongst their great officers many hoping to succeed him, and, the succession having been promised to Major-General Lambert, would have mutinied against him. He was therefore forced to stay for a more propitious conjuncture.

B.

What were those articles?

A.

The most important of them were: 1. That he would exercise the office of chief-magistrate of England, Scotland, and Ireland, under the title of Protector, and govern the same according to the said petition and advice: and that he would in his life-time name his successor.

B.

I believe the Scots, when they first rebelled, never thought of being governed absolutely, as they were by Oliver Cromwell.

A.

That he should call a Parliament every three years at farthest. 3. That those persons which were legally chosen members, should not be secluded without consent of the House. In allowing this clause, the Protector observed not that the secluded members of this same Parliament, are thereby re-admitted. 4. The members were qualified. 5. The power of the other House was defined. 6. That no law should be made but by act of Parliament. 7. That a constant yearly revenue of a million of pounds should be settled for the maintenance of the army and navy; and 300,000l. for the support of the government, besides other temporary supplies as the House of Commons should think fit. 8. That all the officers of state should be chosen by the Parliament. 9. That the Protector should encourage the ministry. Lastly, that he should cause a profession of religion to be agreed on and published. There are divers others of less importance. Having signed the articles, he was presently with great ceremony installed anew.

B.

What needed that, seeing he was still but Protector?

A.

But the articles of this petition were not all the same with those of his former instrument. For now there was to be another House; and whereas before, his council was to name his successor, he had power now to do it himself; so that he was an absolute monarch, and might leave the succession to his son if he would, and so successively, or transfer it to whom he pleased.

The ceremony being ended, the Parliament adjourned to the 20th of January following; and then the other House also sat with their fellows.

The House of Commons being now full, took little notice of the other House, wherein there were not of sixty persons above nine lords; but fell a questioning all that their fellows had done, during the time of their seclusion; whence had followed the avoidance of the power newly placed in the Protector. Therefore, going to the House, he made a speech to them, ending in these words; By the living God, I must, and do dissolve you.

In this year, the English gave the Spaniard another great blow at Santa Cruz, not much less than they had given him the year before at Cadiz.

About the time of the dissolution of this Parliament, the royalists had another design against the Protector; which was, to make an insurrection in England, the King being in Flanders ready to second them with an army thence. But this also was discovered by treachery, and came to nothing but the ruin of those that were engaged in it; whereof many in the beginning of the next year were by a High Court of Justice imprisoned, and some executed.

This year also was Major-General Lambert put out of all employment, a man second to none but Oliver in the favour of the army. But because he

expected by that favour, or by promise from the Protector, to be his successor in the supreme power, it would have been dangerous to let him have command in the army; the Protector having designed for his successor his eldest son Richard.

In the year 1658, September the 3rd, the Protector died at Whitehall; having ever since his last establishment been perplexed with fear of being killed by some desperate attempt of the royalists.

Being importuned in his sickness by his privy-council to name his successor, he named his son Richard; who, encouraged thereunto, not by his own ambition, but by Fleetwood, Desborough, Thurlow, and other of his council, was content to take it upon him; and presently, addresses were made to him from the armies in England, Scotland and Ireland. His first business was the chargeable and splendid funeral of his father.

Thus was Richard Cromwell seated on the imperial throne of England, Ireland, and Scotland, successor to his father; lifted up to it by the officers of the army then in town, and congratulated by all the parts of the army throughout the three nations; scarce any garrison omitting their particular flattering addresses to him.

B.

Seeing the army approved of him, how came he so soon cast off?

A.

The army was inconstant; he himself irresolute, and without any military glory. And though the two principal officers had a near relation to him; yet neither of them, but Lambert, was the great favourite of the army; and by courting Fleetwood to take upon him the Protectorship, and by tampering with the soldiers, he had gotten again to be a colonel. He and the rest of the officers had a council at Wallingford House,

where Fleetwood dwelt, for the dispossessing of Richard; though they had not yet considered how the nations should be governed afterwards. For from the beginning of the rebellion, the method of ambition was constantly this, first to destroy, and then to consider what they should set up.

B.

Could not the Protector, who kept his court at Whitehall, discover what the business of the officers was at Wallingford House, so near him?

A.

Yes, he was by divers of his friends informed of it; and counselled by some of them, who would have done it, to kill the chief of them. But he had not courage enough to give them such a commission. He took, therefore, the counsel of some milder persons, which was to call a Parliament. Whereupon writs were presently sent to those, that were in the last Parliament, of the other House, and other writs to the sheriffs for the election of knights and burgesses, to assemble on the 27th of January following. Elections were made according to the ancient manner, and a House of Commons now of the right English temper, and about four hundred in number, including twenty for Scotland and as many for Ireland. Being met, they take themselves, without the Protector and other House, to be a Parliament, and to have the supreme power of the three nations.

For the first business, they intended the power of that other House: but because the Protector had recommended to them for their first business an act, already drawn up, for the recognition of his Protectoral power, they began with that; and voted after a fortnight's deliberation, that an act should be made whereof this act of recognition should be part; and

that another part should be for the bounding of the Protector's power, and for the securing the privileges of Parliament and liberties of the subject; and that all should pass together.

B.

Why did these men obey the Protector at first, in meeting upon his only summons? Was not that as full a recognition of his power as was needful? Why by this example did they teach the people that he was to be obeyed, and then by putting laws upon him, teach them the contrary? Was it not the Protector that made the Parliament? Why did they not acknowledge their maker?

A.

I believe it is the desire of most men to bear rule; but few of them know what title one has to it more than another, besides the right of the sword.

B.

If they acknowledged the right of the sword, they were neither just nor wise to oppose the present government, set up and approved by all the forces of the three kingdoms. The principles of this House of Commons were, no doubt, the very same with theirs that began the rebellion; and would, if they could have raised a sufficient army, have done the same against the Protector; and the general of their army would, in like manner, have reduced them to a Rump. For they that keep an army, and cannot master it, must be subject to it as much as he that keeps a lion in his house. The temper of all the Parliaments, since the time of Queen Elizabeth, has been the same with the temper of this Parliament; and

shall always be such, as long as the Presbyterians and men of democratical principles have the like influence upon the elections.

A.

After, they resolved concerning the other House, that during this Parliament they would transact with it, but without intrenching upon the right of the peers, to have writs sent to them in all future Parliaments. These votes being passed, they proceed to another, wherein they assume to themselves the power of the militia. Also to show their supreme power, they delivered out of prison some of those that had been, they said, illegally committed by the former Protector. Other points concerning civil rights and concerning religion, very pleasing to the people, were now also under their consideration. So that at the end of this year the Protector was no less jealous of the Parliament, than of the council of officers at Wallingford House.

B.

Thus it is when ignorant men will undertake reformation. Here are three parties, the Protector, the Parliament, and the Army. The Protector against Parliament and army, the Parliament against army and Protector, and the army against Protector and Parliament.

A.

In the beginning of 1659 the Parliament passed divers other acts. One was, to forbid the meetings in council of the army-officers without order from the Protector and both houses. Another, that no man shall have any command or trust in the army, who did not first, under his hand, engage himself never to interrupt any of the members, but that they might freely

meet and debate in the House. And to please the soldiers, they voted to take presently into their consideration the means of paying them their arrears. But whilst they were considering this, the Protector, according to the first of those acts, forbade the meeting of officers at Wallingford House. This made the government, which by the disagreement of the Protector and army was already loose, to fall in pieces. For the officers from Wallingford House, with soldiers enough, came over to Whitehall, and brought with them a commission ready drawn, giving power to Desborough to dissolve the Parliament, for the Protector to sign; which also, his heart and his party failing him, he signed. The Parliament nevertheless continued sitting; but at the end of the week the House adjourned till the Monday after, being April the 25th. At their coming on Monday morning, they found the door of the House shut up, and the passages to it filled with soldiers, who plainly told them they must sit no longer. Richard's authority and business in town being thus at an end, he retired into the country; where within a few days, upon promise of the payment of his debts, which his father's funeral had made great, he signed a resignation of his Protectorship.

B.

To whom?

A.

To nobody. But after ten days' cessation of the sovereign power, some of the Rumpers that were in town, together with the old Speaker Mr. William Lenthall, resolved amongst themselves, and with Lambert, Hazlerig, and other officers, who were also Rumpers, in all forty-two, to go into the House; which they did, and were by the army declared to be the Parliament.

There were also in Westminster Hall at that time, about their private business, some few of those whom the army had secluded in 1648, and were called the secluded members. These knowing themselves to have been elected by the same authority, and to have the same right to sit, attempted to get into the House, but were kept out by the soldiers. The first vote of the Rump resealed was, that such persons as, heretofore members of this Parliament, have not sitten in this Parliament since the year 1648, shall not sit in this House till further order of the Parliament. And thus the Rump recovered their authority May the 7th 1659, which they lost in April 1653.

B.

Seeing there had been so many shiftings of the supreme authority, I pray you, for memory's sake, repeat them briefly in times and order.

A.

First, from 1640 to 1648, when the King was murdered, the sovereignty was disputed between King Charles I and the Presbyterian Parliament. Secondly, from 1648 to 1653, the power was in that part of the Parliament which voted the trial of the King, and declared themselves, without King or House of Lords, to have the supreme authority of England and Ireland. For there were in the Long Parliament two factions, the Presbyterian and Independent; the former whereof sought only the subjection of the King, not his destruction directly; the latter sought directly his destruction; and this part is it, which was called the Rump. Thirdly, from April the 20th to July the 4th, the supreme power was in the hands of a council of state constituted by Cromwell. Fourthly, from July the 4th to December the 12th of the same year, it was in the hands of men called unto it by Cromwell, whom he termed men of

fidelity and integrity, and made them a Parliament; which was called, in contempt of one of the members, Barebone's Parliament. Fifthly, from December the 12th 1653 to September the 3rd 1658, it was in the hands of Oliver Cromwell, with the title of Protector. Sixthly, from September the 3rd 1658 to April the 25th 1659, Richard Cromwell had it as successor to his father. Seventhly, from April the 25th 1659 to May the 7th of the same year, it was nowhere. Eighthly, from May the 7th 1659, the Rump, which was turned out of doors in 1653, recovered it again; and shall lose it again to a committee of safety, and again recover it, and again lose it to the right owner.

B.

By whom, and by what art, came the Rump to be turned out the second time?

A.

One would think them safe enough. The army in Scotland, which when it was in London had helped Oliver to put down the Rump, submitted now, begged pardon, and promised obedience. The soldiers in town had their pay mended, and the commanders everywhere took the old engagement, whereby they had acknowledged their authority heretofore. They also received their commissions in the House itself from the speaker, who was generalissimo. Fleetwood was made lieutenant-general, with such and so many limitations as were thought necessary by the Rump, that remembered how they had been served by the general, Oliver. Also Henry Cromwell, lord-lieutenant of Ireland, having resigned his commission by command, returned into England. But Lambert, to whom, as was said, Oliver had promised the succession, and who as well as the Rump knew the way to the

Protectorship by Oliver's own footsteps, was resolved to proceed in it upon the first opportunity; which presented itself presently after. Besides some plots of royalists, whom after the old fashion they again persecuted, there was an insurrection made against them by Presbyterians in Cheshire, headed by Sir George Booth, one of the secluded members. They were in number about 3,000, and their pretence was for a free Parliament. There was a great talk of another rising, or endeavour to rise, in Devonshire and Cornwall at the same time. To suppress Sir George Booth, the Rump sent down more than a sufficient army under Lambert; which quickly defeated the Cheshire party, and recovered Chester, Liverpool, and all the other places they had seized. Divers also of their commanders in and after the battle were taken prisoners, whereof Sir George Booth himself was one.

This exploit done, Lambert, before his return, caressed his soldiers with an entertainment at his own house in Yorkshire, and got their consent to a petition to be made to the House, that a general might be set up in the army; as being unfit that the army should be judged by any power extrinsic to itself.

B.

I do not see that unfitness.

A.

Nor I. But it was, as I have heard, an axiom of Sir Henry Vane's. But it so much displeased the Rump, that they voted, that the having of more generals in the army than were already settled, was unnecessary, burthensome, and dangerous to the commonwealth.

B.

This was not Oliver's method; for though this Cheshire victory had been as glorious as that of Oliver at Dunbar, yet it was not the victory that made Oliver general, but the resignation of Fairfax, and the proffer of it to Cromwell by the Parliament.

A.

But Lambert thought so well of himself, as to expect it. Therefore, at his return to London, he and the other officers assembling at Wallingford House, drew their petition into form, and called it a representation; wherein the chief point was to have a general, but many others of less importance were added; and this they represented to the House, October the 4th, by Major-General Desborough. And this so far awed them, as to teach them so much good manners as to promise to take it presently into debate. Which they did; and October the 12th, having recovered their spirits, voted "that the commissions of Lambert, Desborough, and others of the council at Wallingford House, should be void: item, that the army should be governed by a commission to Fleetwood, Monk, Hazlerig, Walton, Morley, and Overton, till February the 12th following." And to make this good against the force they expected from Lambert, they ordered Hazlerig and Morley to issue warrants to such officers as they could trust, to bring their soldiers next morning into Westminster; which was done somewhat too late. For Lambert had first brought his soldiers thither, and beset the House, and turned back the Speaker, which was then coming to it; but Hazlerig's forces marching about St. James's park-wall, came into St. Margaret's churchyard; and so both parties looked all day one upon another, like enemies, but offered not to fight: whereby the Rump was put out of possession of the House; and the officers continued their meeting as before, at Wallingford House.

There they chose from among themselves, with some few of the city, a committee, which they called a committee of safety, whereof the chief were Lambert and Vane; who, with the advice of a general council of officers, had power to call delinquents to trial, to suppress rebellions, to treat with foreign states, &c. You see now the Rump cut off, and the supreme power, which is charged with *salus populi*, transferred to a council of officers. And yet Lambert hopes for it in the end. But one of their limitations was, that they should within six weeks present to the army a new model of the government. If they had done so, do you think they would have preferred Lambert or any other to the supreme authority therein, rather than themselves?

B.

I think not. When the Rump had put into commission, amongst a few others, for the government of the army, that is to say, for the government of the three nations, General Monk, already commander-in-chief of the army in Scotland, and that had done much greater things in this war than Lambert, how durst they leave him out of this committee of safety? Or how could Lambert think that General Monk would forgive it, and not endeavour to fasten the Rump again?

A.

They thought not of him; his gallantry had been shown on remote stages, Ireland and Scotland. His ambition had not appeared here in their contentions for the government, but he had complied both with Richard and the Rump. After General Monk had signified by letter his dislike of the proceedings of Lambert and his fellows, they were much surprised, and began to think him more considerable than they had done; but it was too late.

B.

Why? His army was too small for so great an enterprise.

A.

The general knew very well his own and their forces, both what they were then, and how they might be augmented, and what generally city and country wished for, which was the restitution of the King: which to bring about, there needed no more but to come with his army, though not very great, to London: to the doing whereof, there was no obstacle but the army with Lambert. What could he do in this case? If he had declared presently for the King or for a free Parliament, all the armies in England would have joined against him, and assuming the title of a Parliament would have furnished themselves with money.

General Monk, after he had thus quarrelled by his letter with the council-officers, secured first those officers of his own army, which were Anabaptists and therefore not to be trusted, and put others into their places; then drawing his forces together, marched to Berwick. Being there, he indicted a convention of the Scots, of whom he desired that they would take order for the security of that nation in his absence, and raise some maintenance for his army in their march. The convention promised for the security of the nation their best endeavour, and raised him a sum of money, not great, but enough for his purpose, excusing themselves upon their present wants. On the other side, the committee of safety with the greatest and best part of their army sent Lambert to oppose him; but at the same time, by divers messages and mediators urged him to a treaty; which he consented to, and sent three officers to London to treat with as many of theirs. These six suddenly concluded, without power from the general, upon these articles: that the King be

excluded; a free state settled; the ministry and universities encouraged; with divers others. Which the general liked not, and imprisoned one of his commissioners for exceeding his commission. Whereupon another treaty was agreed on, of five to five. But whilst these treaties were in hand, Hazlerig, a member of the Rump, seized on Portsmouth, and the soldiers sent by the committee of safety to reduce it, instead of that, entered into the town and joined with Hazlerig. Secondly, the city renewed their tumults for a free Parliament. Thirdly, the Lord Fairfax, a member also of the Rump, and greatly favoured in Yorkshire, was raising forces there behind Lambert, who being now between two armies, his enemies would gladly have fought with the general. Fourthly, there came news that Devonshire and Cornwall were listing of soldiers. Lastly, Lambert's army wanting money, and sure they should not be furnished from the council of officers, which had neither authority nor strength to levy money, grew discontented, and for their free quarters were odious to the northern countries.

B.

I wonder why the Scots were so ready to furnish General Monk with money; for they were no friends to the Rump.

A.

I know not; but I believe the Scots would have parted with a greater sum, rather than the English should not have gone together by the ears amongst themselves. The council of officers being now beset with so many enemies, produced speedily their model of government; which was to have a free Parliament, which should meet December the 15th, but with such qualifications of no King, no House of Lords, as made the city more angry than before. To send soldiers into the west to suppress

those that were rising there, they durst not, for fear of the city; nor could they raise any other for want of money. There remained nothing but to break, and quitting Wallingford House to shift for themselves. This coming to the knowledge of their army in the north, they deserted Lambert; and the Rump, the 26th of December, repossessed the House.

B.

Seeing the Rump was now resealed, the business pretended by General Monk for his marching to London, was at an end.

A.

The Rump, though seated, was not well settled, but in the midst of so many tumults for a free Parliament had as much need of the general's coming up now as before. He therefore sent them word, that because he thought them not yet secure enough, he would come up to London with his army; which they not only accepted, but also intreated him to do, and voted him for his services 1000l. a year.

The general marching towards London, the country every where petitioned him for a free Parliament. The Rump, to make room in London for his army, dislodged their own. The general for all that, had not let fall a word in all this time that could be taken for a declaration of his final design.

B.

How did the Rump revenge themselves on Lambert?

A.

They never troubled him; nor do I know any cause of so gentle dealing with him: but certainly Lambert was the ablest of any officer they had to do them service, when they should have means and need to employ him. After the general was come to London, the Rump sent to the city for their part of a tax of 100,000l. a month, for six months, according to an act which the Rump had made formerly before their disseisin by the committee of safety. But the city, who were adverse to the Rump, and keen upon a free Parliament, could not be brought to give their money to their enemies and to purposes repugnant to their own. Hereupon the Rump sent order to the general to break down the city gates and their portcullises, and to imprison certain obstinate citizens. This he performed, and it was the last service he did them.

About this time the commission, by which general Monk with others had the government of the army put into their hands by the Rump before the usurpation of the council of officers, came to expire; which the present Rump renewed.

B.

He was thereby the sixth part of the general of the whole forces of the commonwealth. If I had been as the Rump, he should have been sole general. In such cases as this, there cannot be a greater vice than pinching. Ambition should be liberal.

A.

After the pulling down of the city gates, the general sent a letter to the Rump, to let them know that that service was much against his nature, and to put them in mind how well the city had served the Parliament throughout the whole war.

B.

Yes. But for the city the Parliament never could have made the war, nor the Rump ever have murdered the King.

A.

The Rump considered not the merit of the city, nor the good-nature of the general. They were busy. They were giving out commissions, making of acts for abjuration of the King and his line, and for the old engagement, and conferring with the city to get money. The general also desired to hear conference between some of the Rump and some of the secluded members, concerning the justice of their seclusion, and of the hurt that could follow from their readmission: and it was granted, after long conference. The general finding the Rump's pretences unreasonable and ambitious, declared himself with the city for a free Parliament, and came to Westminster with the secluded members, (whom he had appointed to meet and stay for him at Whitehall), and replaced them in the House amongst the Rumpers; so that now the same cattle that were in the House of Commons in 1640, except those that were dead and those that went from them to the late King at Oxford, are all there again.

B.

But this, methinks, was no good service to the King, unless they had learned better principles.

A.

They had learned nothing. The major part was now again Presbyterian. It is true they were so grateful to General Monk as to make him general of all the forces in the three nations. They did well also to make void the engagement; but it was because those acts were made to the prejudice of their party; but recalled none of their own rebellious ordinances, nor did anything in order to the good of the present King; but on the contrary, they declared by a vote, that the late King began the war against his two Houses.

B.

The two Houses considered as two persons, were they not two of the King's subjects? If a king raise an army against his subject, is it lawful for that subject to resist with force, when, as in this case, he might have had peace upon his submission?

A.

They knew they had acted vilely and sottishly; but because they had always pretended to greater than ordinary wisdom and godliness, they were loath to confess it. The Presbyterians now saw their time to make a Confession of their Faith, and presented it to the House of Commons to show they had not changed their principles; which, after six readings in the House, was voted to be printed, and once a year to be read publicly in every church.

B.

I say again, this re-establishing of the Long Parliament was no good service to the King.

A.

Have a little patience. They were re-established with two conditions; one to determine their sitting before the end of March; another to send out writs before their rising for new elections.

B.

That qualifies.

A.

That brought in the King: for few of this Long Parliament, the country having felt the smart of their former service, could get themselves chosen again. This New Parliament began to sit April the 25th 1660. How soon these called in the King; with what joy and triumph he was received; how earnestly his Majesty pressed the Parliament for the act of oblivion, and how few were excepted out of it; you know as well as I.

B.

But I have not yet observed in the Presbyterians any oblivion of their former principles. We are but returned to the state we were in at the beginning of the sedition.

A.

Not so: for before that time, though the Kings of England had the right of the militia in virtue of the sovereignty, and without dispute, and without any particular act of Parliament directly to that purpose; yet now, after this bloody dispute, the next, which is the present, Parliament, in proper and express terms hath declared the same to be the

right of the King only, without either of his Houses of Parliament; which act is more instructive to the people, than any arguments drawn from the title of sovereign, and consequently fitter to disarm the ambition of all seditious haranguers for the time to come.

B.

I pray God it prove so. Howsoever, I must confess that this Parliament has done all that a Parliament can do for the security of our peace: which I think also would be enough, if preachers would take heed of instilling evil principles into their auditory. I have seen in this revolution a circular motion of the sovereign power through two usurpers, from the late King to this his son. For (leaving out the power of the council of officers, which was but temporary, and no otherwise owned by them but in trust) it moved from King Charles I to the Long Parliament; from thence to the Rump; from the Rump to Oliver Cromwell; and then back again from Richard Cromwell to the Rump; thence to the Long Parliament; and thence to King Charles II, where long may it remain.

A.

Amen. And may he have as often as there shall be need such a general.

B.

You have told me little of the general till now in the end: but truly, I think the bringing of his little army entirely out of Scotland up to London, was the greatest stratagem that is extant in history.

The Translations

The Old Grammar Hall, Magdalen College, part of the original Magdalen Hall site — where Hobbes was educated at Oxford.

Eight Books of the Peloponnesian War

MOLESWORTH 1840 EDITION

In 1610 Hobbes became a companion to the younger William Cavendish, 2nd Earl of Devonshire. He served at Chatsworth House as his private tutor for many years and they both took part in a grand tour of Europe. Hobbes was exposed to European scientific and critical methods during the tour, in contrast to the scholastic philosophy that he had learned in Oxford. His scholarly efforts at the time were aimed at a careful study of classic Greek and Latin authors. In 1628, he released his translation of the ancient Greek historian Thucydides' *History of the Peloponnesian War*, the first translation in English from the classical Greek.

Divided into eight books, the text provides a historical account of the Peloponnesian War (431-404 BC), which was fought between the Peloponnesian League (led by Sparta) and the Delian League (led by Athens). Thucydides was an Athenian historian, who also happened to serve as an Athenian general during the war. His account of the conflict is widely considered to be a classic and is widely regarded as one of the earliest scholarly works of history.

William Cavendish, 2nd Earl of Devonshire, c. 1590

ADVERTISEMENT.

THE MERIT OF Hobbes' translation of Thucydides lies principally in the simplicity and force of the language: bearing in that respect some affinity to the original. Viewed merely as a translation, it will be found to contain, owing partly to the corrupt state of the Greek text of his day, partly to his habitual disregard of minute details so that accuracy were attained in essentials, manifold errors and omissions. As these defects disfigure the narrative, and sometimes perplex the reader, it has been considered worth while to attempt, by short notes, something towards their removal: without however affecting to offer a translation either critically correct or even free from many errors. In the performance of this task the interpretations of Goeller, Arnold, Thirlwall and others, have been followed wheresoever they were available: where such help failed, the editor had to rely on his own imperfect resources.

To render the work more useful to the English reader and those not deeply versed in Grecian history, some historical notes have been added, drawn for the most part in substance from Mueller's history of the Dorians, Hermann's Grecian Antiquities, Thirlwall's history of Greece, Niebuhr's history of Rome, &c. Wheresoever Aristotle is cited, his Politics will be understood to be the work referred to.

Several phrases having been marked by Hobbes himself with square brackets, to designate them as interpolations, the same marks have been added for the same purpose to other words and passages.

Those corrections of the Greek text by Bekker and others only have been noticed, which serve to explain the cause of Hobbes' departure in those

instances from the right interpretation.

It has been considered useless to reprint the maps belonging to the original edition, and referred to in the Epistle to the Reader. These were unavoidably rude and imperfect, and have been long superseded both by the more general maps to be found in any modern Atlas, and the numerous maps and plans which have been published of late years for the particular illustration of this history. It has however been thought useful to append Goeller's map of the siege of Syracuse, which is accessible only in his edition of the text.

E. G.

**TO THE RIGHT HONOURABLE SIR WILLIAM
CAVENDISH, KNIGHT OF THE BATH, BARON OF
HARDWICK, AND EARL OF DEVONSHIRE.**

RIGHT HONOURABLE, I take confidence from your Lordship's goodness in the very entrance of this Epistle, to profess, with simplicity and according to the faith I owe my master now in heaven, that it is not unto yourself, but to your Lordship's father that I dedicate this my labour, such as it is. For neither am I at liberty to make choice of one to whom I may present it as a voluntary oblation; being bound in duty to bring it in as an account to him, by whose indulgence I had both the time and ammunition to perform it. Nor if such obligation were removed, know I any to whom I ought to dedicate it rather. For by the experience of many years I had the honour to serve him, I know this: there was not any, who more really, and less for glory's sake favoured those that studied the liberal arts liberally, than my Lord your father did; nor in whose house a man should less need the university than in his. For his own study, it was bestowed, for the most part, in that kind of learning which best deserveth the pains and hours of great persons, history and civil knowledge: and directed not to the ostentation of his reading, but to the government of his life and the public good. For he read, so that the learning he took in by study, by judgment he digested, and converted into wisdom and ability to benefit his country: to which also he applied himself with zeal, but such as took no fire either from faction or ambition. And as he was a most able man, for soundness of advice and clear expression of himself, in matters of difficulty and consequence, both in public and private: so also was he one whom no man was able either to draw or justle

out of the straight path of justice. Of which virtue, I know not whether he deserved more by his severity in imposing it (as he did to his last breath) on himself, or by his magnanimity in not exacting it to himself from others. No man better discerned of men: and therefore was he constant in his friendships, because he regarded not the fortune nor adherence, but the men; with whom also he conversed with an openness of heart that had no other guard than his own integrity and that nil conscire. To his equals he carried himself equally, and to his inferiors familiarly; but maintaining his respect fully, and only with the native splendour of his worth. In sum, he was one in whom might plainly be perceived, that honour and honesty are but the same thing in the different degrees of persons. To him therefore, and to the memory of his worth, be consecrated this, though unworthy, offering.

And now, imitating in this civil worship the religious worship of the gentiles; who, when they dedicated any thing to their gods, brought and presented the same to their images: I bring and present this gift of mine, the history of thucydides, translated into English with much more diligence than elegance, to your Lordship; who are the image of your father, (for never was a man more exactly copied out than he in you), and who have in you the seeds of his virtues already springing up: humbly intreating your Lordship to esteem it amongst the goods that descend upon you, and in your due time to read it. I could recommend the author unto you, not impertinently, for that he had in his veins the blood of kings; but I choose rather to recommend him for his writings, as having in them profitable instruction for noblemen, and such as may come to have the managing of great and weighty actions. For I may confidently say, that notwithstanding the excellent both examples and precepts of heroic virtue you have at home, this book will confer not a little to your institution; especially when you come to the years to frame your life by your own observation. For in history, actions of honour and dishonour do appear plainly and distinctly,

which are which; but in the present age they are so disguised, that few there be, and those very careful, that be not grossly mistaken in them. But this, I doubt not, is superfluously spoken by me to your Lordship. Therefore I end with this prayer: that it will please God to give you virtues suitable to the fair dwelling he hath prepared for them, and the happiness that such virtues lead unto both in and after this world.

Your Lordship's most humble servant,

Tho: Hobbes.

TO THE READERS.

THOUGH THIS TRANSLATION have already past the censure of some, whose judgments I very much esteem: yet because there is something, I know not what, in the censure of a multitude, more terrible than any single judgment, how severe or exact soever, I have thought it discretion in all men, that have to do with so many, and to me, in my want of perfection, necessary, to bespeak your candour. Which that I may upon the better reason hope for, I am willing to acquaint you briefly, upon what grounds I undertook this work at first; and have since, by publishing it, put myself upon the hazard of your censure, with so small hope of glory as from a thing of this nature can be expected. For I know, that mere translations have in them this property: that they may much disgrace, if not well done; but if well, not much commend the doer.

It hath been noted by divers, that Homer in poesy, Aristotle in philosophy, Demosthenes in eloquence, and others of the ancients in other knowledge, do still maintain their primacy: none of them exceeded, some not approached, by any in these later ages. And in the number of these is justly ranked also our Thucydides; a workman no less perfect in his work, than any of the former; and in whom (I believe with many others) the faculty of writing history is at the highest. For the principal and proper work of history being to instruct and enable men, by the knowledge of actions past, to bear themselves prudently in the present and providently towards the future: there is not extant any other (merely human) that doth more naturally and fully perform it, than this of my author. It is true, that there be many excellent and profitable histories written since: and in some of them

there be inserted very wise discourses, both of manners and policy. But being discourses inserted, and not of the contexture of the narration, they indeed commend the knowledge of the writer, but not the history itself: the nature whereof is merely narrative. In others, there be subtle conjectures at the secret aims and inward cogitations of such as fall under their pen; which is also none of the least virtues in a history, where conjecture is thoroughly grounded, not forced to serve the purpose of the writer in adorning his style, or manifesting his subtlety in conjecturing. But these conjectures cannot often be certain, unless withal so evident, that the narration itself may be sufficient to suggest the same also to the reader. But Thucydides is one, who, though he never digress to read a lecture, moral or political, upon his own text, nor enter into men's hearts further than the acts themselves evidently guide him: is yet accounted the most politic historiographer that ever writ. The reason whereof I take to be this. He filleth his narrations with that choice of matter, and ordereth them with that judgment, and with such perspicuity and efficacy expresseth himself, that, as Plutarch saith, he maketh his auditor a spectator. For he setteth his reader in the assemblies of the people and in the senate, at their debating; in the streets, at their seditions; and in the field, at their battles. So that look how much a man of understanding might have added to his experience, if he had then lived a beholder of their proceedings, and familiar with the men and business of the time: so much almost may he profit now, by attentive reading of the same here written. He may from the narrations draw out lessons to himself, and of himself be able to trace the drifts and counsels of the actors to their seat.

These virtues of my author did so take my affection, that they begat in me a desire to communicate him further: which was the first occasion that moved me to translate him. For it is an error we easily fall into, to believe that whatsoever pleaseth us, will be in like manner and degree acceptable to all: and to esteem of one another's judgment, as we agree in the liking or

dislike of the same things. And in this error peradventure was I, when I thought, that as many of the more judicious as I should communicate him to, would affect him as much as I myself did. I considered also, that he was exceedingly esteemed of the Italians and French in their own tongues: notwithstanding that he be not very much beholden for it to his interpreters. Of whom (to speak no more than becomes a candidate of your good opinion in the same kind) I may say this: that whereas the author himself so carrieth with him his own light throughout, that the reader may continually see his way before him, and by that which goeth before expect what is to follow; I found it not so in them. The cause whereof, and their excuse, may be this: they followed the Latin of Laurentius Valla, which was not without some errors; and he a Greek copy not so correct as now is extant. Out of French he was done into English (for I need not dissemble to have seen him in English) in the time of King Edward the Sixth: but so, as by multiplication of error he became at length traduced, rather than translated into our language. Hereupon I resolved to take him immediately from the Greek, according to the edition of Æmilius Porta: not refusing or neglecting any version, comment, or other help I could come by. Knowing that when with diligence and leisure I should have done it, though some error might remain, yet they would be errors but of one descent; of which nevertheless I can discover none, and hope they be not many. After I had finished it, it lay long by me: and other reasons taking place, my desire to communicate it ceased.

For I saw that, for the greatest part, men came to the reading of history with an affection much like that of the people in Rome: who came to the spectacle of the gladiators with more delight to behold their blood, than their skill in fencing. For they be far more in number, that love to read of great armies, bloody battles, and many thousands slain at once, than that mind the art by which the affairs both of armies and cities be conducted to

their ends. I observed likewise, that there were not many whose ears were well accustomed to the names of the places they shall meet with in this history; without the knowledge whereof it can neither patiently be read over, perfectly understood, nor easily remembered: especially being many, as here it falleth out. Because in that age almost every city both in Greece and Sicily, the two main scenes of this war, was a distinct commonwealth by itself, and a party in the quarrel.

Nevertheless I have thought since, that the former of these considerations ought not to be of any weight at all, to him that can content himself with the few and better sort of readers: who, as they only judge, so is their approbation only considerable. And for the difficulty arising from the ignorance of places, I thought it not so insuperable, but that with convenient pictures of the countries it might be removed. To which purpose, I saw there would be necessary especially two: a general map of Greece, and a general map of Sicily. The latter of these I found already extant, exactly done by Philip Cluverius; which I have caused to be cut, and you have it at the beginning of the sixth book. But for maps of Greece, sufficient for this purpose, I could light on none. For neither are the tables of Ptolomy, and descriptions of those that follow him, accommodate to the time of Thucydides; and therefore few of the places by him mentioned, therein described: nor are those that be, agreeing always with the truth of history. Wherefore I was constrained to draw one as well as I could myself. Which to do, I was to rely for the main figure of the country on the modern description now in reputation: and in that, to set down those places especially (as many as the volume was capable of) which occur in the reading of this author, and to assign them that situation, which, by travel in Strabo, Pausanias, Herodotus, and some other good authors, I saw belonged unto them. And to shew you that I have not played the mountebank in it, putting down exactly some few of the principal, and the rest at adventure,

without care and without reason, I have joined with the map an index, that pointeth to the authors which will justify me where I differ from others. With these maps, and those few brief notes in the margin upon such passages as I thought most required them, I supposed the history might be read with very much benefit by all men of good judgment and education, (for whom also it was intended from the beginning by Thucydides), and have therefore at length made my labour public, not without hope to have it accepted. Which if I obtain, though no otherwise than in virtue of the author's excellent matter, it is sufficient.

OF THE LIFE AND HISTORY OF THUCYDIDES.

WE READ OF divers men that bear the name of Thucydides. There is Thucydides a Pharsalian, mentioned in the eighth book of this history; who was public host of the Athenians in Pharsalus, and chancing to be at Athens at the time that the government of the four hundred began to go down, by his interposition and persuasion kept asunder the factions then arming themselves, that they fought not in the city to the ruin of the commonwealth. There is Thucydides the son of Milesias, an Athenian, of the town of Alope, of whom Plutarch speaketh in the life of Pericles; and the same, in all probability, that in the first book of this history is said to have had the charge of forty galleys sent against Samos, about twenty-four years before the beginning of this war. Another Thucydides the son of Ariston, an Athenian also, of the town of Acherdus, was a poet; though of his verses there be nothing extant. But Thucydides the writer of this history, an Athenian, of the town of Halimus, was the son of Olorus (or Orolus) and Hegesypele. His father's name is commonly written Olorus, though in the inscription on his tomb it was Orolus. Howsoever it be written, it is the same that was borne by divers of the kings of Thrace; and imposed on him with respect unto his descent from them. So that though our author (as Cicero saith of him, lib. ii. De Oratore,) had never written an history, yet had not his name not been extant, in regard of his honour and nobility. And not only Plutarch, in the life of Cimon, but also almost all others that have touched this point, affirm directly that he was descended from the Thracian kings: adducing this for proof, that he was of the house of Miltiades, that famous general of the Athenians against the Persians at Marathon; which

they also prove by this, that his tomb was a long time extant amongst the monuments of that family. For near unto the gates of Athens, called Melitides, there was a place named Coela; and in it the monuments called Cimoniana, belonging to the family of Miltiades, in which none but such as were of that family might be buried. And amongst those was the monument of Thucydides; with this inscription, Thucydides Oroli Halimusius. Now Miltiades is confessed by all, to have descended from Olorus king of Thrace; whose daughter another Miltiades, grandfather to this, married and had children by. And Miltiades, that won the memorable victory at Marathon, was heir to goodly possessions and cities in the Chersonnesus of Thrace; over which also he reigned. In Thrace lay also the possessions of Thucydides, and his wealthy mines of gold: as he himself professth in his fourth book. And although those riches might come to him by a wife (as is also by some affirmed) which he married in Scapte-Hyle, a city of Thrace; yet even by that marriage it appeareth, that his affairs had a relation to that country, and that his nobility was not there unknown. But in what degree of kindred Miltiades and he approached each other, is not anywhere made manifest. Some also have conjectured that he was of the house of the Peisistratides: the ground of whose conjecture hath been only this, that he maketh honourable mention of the government of Peisistratus and his sons, and extenuateth the glory of Harmodius and Aristogeiton; proving that the freeing of the state of Athens from the tyranny of the Peisistratides was falsely ascribed to their fact, (which proceeded from private revenge in a quarrel of love), by which the tyranny ceased not, but grew heavier to the state, till it was at last put down by the Lacedæmonians. But this opinion, as it is not so well-grounded, so neither is it so well received as the former.

Agreeable to his nobility, was his institution in the study of eloquence and philosophy. For in philosophy, he was the scholar (as also was Pericles and Socrates) of Anaxagoras; whose opinions, being of a strain above the

apprehension of the vulgar, procured him the estimation of an atheist: which name they bestowed upon all men that thought not as they did of their ridiculous religion, and in the end cost him his life. And Socrates after him for the like causes underwent the like fortune. It is not therefore much to be regarded, if this other disciple of his were by some reputed an atheist too. For though he were none, yet it is not improbable, but by the light of natural reason he might see enough in the religion of these heathen, to make him think it vain and superstitious; which was enough to make him an atheist in the opinion of the people. In some places of his history he noteth the equivocation of the oracles; and yet he confirmeth an assertion of his own, touching the time this war lasted, by the oracle's prediction. He taxeth Nicias for being too punctual in the observation of the ceremonies of their religion, when he overthrew himself and his army, and indeed the whole dominion and liberty of his country, by it. Yet he commendeth him in another place for his worshipping of the gods, and saith in that respect, he least of all men deserved to come to so great a degree of calamity as he did. So that in his writings our author appeareth to be, on the one side not superstitious, on the other side not an atheist.

In rhetoric, he was the disciple of Antiphon; one (by his description in the eighth book of this history) for power of speech almost a miracle, and feared by the people for his eloquence. Insomuch as in his latter days he lived retired, but so as he gave counsel to, and writ orations for other men that resorted to him to that purpose. It was he that contrived the deposing of the people, and the setting up of the government of the four hundred. For which also he was put to death, when the people again recovered their authority, notwithstanding that he pleaded his own cause the best of any man to that day.

It need not be doubted, but from such a master Thucydides was sufficiently qualified to have become a great demagogue, and of great

authority with the people. But it seemeth he had no desire at all to meddle in the government: because in those days it was impossible for any man to give good and profitable counsel for the commonwealth, and not incur the displeasure of the people. For their opinion was such of their own power, and of the facility of achieving whatsoever action they undertook, that such men only swayed the assemblies, and were esteemed wise and good commonwealth's men, as did put them upon the most dangerous and desperate enterprizes. Whereas he that gave them temperate and discreet advice, was thought a coward, or not to understand, or else to malign their power. And no marvel: for much prosperity (to which they had now for many years been accustomed) maketh men in love with themselves; and it is hard for any man to love that counsel which maketh him love himself the less. And it holdeth much more in a multitude, than in one man. For a man that reasoneth with himself, will not be ashamed to admit of timorous suggestions in his business, that he may the stronglier provide; but in public deliberations before a multitude, fear (which for the most part adviseth well, though it execute not so) seldom or never sheweth itself or is admitted. By this means it came to pass amongst the Athenians, who thought they were able to do anything, that wicked men and flatterers drave them headlong into those actions that were to ruin them; and the good men either durst not oppose, or if they did, undid themselves. Thucydides therefore, that he might not be either of them that committed or of them that suffered the evil, forbore to come into the assemblies; and propounded to himself a private life, as far as the eminency of so wealthy a person, and the writing of the history he had undertaken, would permit.

For his opinion touching the government of the state, it is manifest that he least of all liked the democracy. And upon divers occasions he noteth the emulation and contention of the demagogues for reputation and glory of wit; with their crossing of each other's counsels, to the damage of the

public; the inconsistency of resolutions, caused by the diversity of ends and power of rhetoric in the orators; and the desperate actions undertaken upon the flattering advice of such as desired to attain, or to hold what they had attained, of authority and sway amongst the common people. Nor doth it appear that he magnifieth anywhere the authority of the few: amongst whom, he saith, every one desireth to be the chief; and they that are undervalued, bear it with less patience than in a democracy; whereupon sedition followeth, and dissolution of the government. He praiseth the government of Athens, when it was mixed of the few and the many; but more he commendeth it, both when Peisistratus reigned, (saving that it was an usurped power), and when in the beginning of this war it was democratical in name, but in effect monarchical under Pericles. So that it seemeth, that as he was of regal descent, so he best approved of the regal government. It is therefore no marvel, if he meddled as little as he could in the business of the commonwealth; but gave himself rather to the observation and recording of what was done by those that had the managing thereof. Which also he was no less prompt, diligent, and faithful by the disposition of his mind, than by his fortune, dignity, and wisdom able, to accomplish. How he was disposed to a work of this nature, may be understood by this: that when being a young man he heard Herodotus the historiographer reciting his history in public, (for such was the fashion both of that, and many ages after), he felt so great a sting of emulation, that it drew tears from him: insomuch as Herodotus himself took notice how violently his mind was set on letters, and told his father Olorus. When the Peloponnesian war began to break out, he conjectured truly that it would prove an argument worthy of his labour: and no sooner it began, than he began his history; pursuing the same not in that perfect manner in which we see it now, but by way of commentary or plain register of the actions and passages thereof, as from time to time they fell out and came to his

knowledge. But such a commentary it was, as might perhaps deserve to be preferred before a history written by another. For it is very probable that the eighth book is left the same as it was when he first writ it: neither beautified with orations, nor so well cemented at the transitions, as the former seven books are. And though he began to write as soon as ever the war was on foot; yet began he not to perfect and polish his history, till after he was banished.

For notwithstanding his retired life upon the coast of Thrace, where his own possessions lay, he could not avoid a service to the state which proved to him afterwards very unfortunate. For whilst he resided in the isle Thasos, it fell out that Brasidas the Lacedæmonian besieged Amphipolis; a city belonging to the Athenians, on the confines of Thrace and Macedonia, distant from Thasos about half a day's sail. To relieve which, the captain thereof for the Athenians sent to Thucydides, to levy a power and make haste unto him: for Thucydides was one of the Strategi, that is, had authority to raise forces in those parts for the service of the commonwealth. And he did accordingly; but he came thither one night too late, and found the city already yielded up. And for this he was afterwards banished; as if he had let slip his time through negligence, or purposely put it off upon fear of the enemy. Nevertheless he put himself into the city of Eion, and preserved it to the Athenians with the repulse of Brasidas; which came down from Amphipolis the next morning, and assaulted it. The author of his banishment is supposed to have been Cleon; a most violent sycophant in those times, and thereby also a most acceptable speaker amongst the people. For where affairs succeed amiss, though there want neither providence nor courage in the conduction; yet with those that judge only upon events, the way to calumny is always open, and envy, in the likeness of zeal to the public good, easily findeth credit for an accusation.

After his banishment he lived in Scapte-Hyle, a city of Thrace before mentioned, as Plutarch writeth; but yet so, as he went abroad, and was present at the actions of the rest of the war; as appeareth by his own words in his fifth book, where he saith, that he was present at the actions of both parts, and no less at those of the Peloponnesians, by reason of his exile, than those of the Athenians. During this time also he perfected his history, so far as is now to be seen; nor doth it appear that after his exile he ever again enjoyed his country. It is not clear in any author, where, or when, or in what year of his own age he died. Most agree that he died in banishment: yet there be that have written, that after the defeat in Sicily the Athenians decreed a general revocation of all banished persons, except those of the family of Peisistratus; and that he then returned, and was afterwards put to death at Athens. But this is very unlikely to be true, unless by after the defeat in Sicily, be meant so long after, that it was also after the end of the Peloponnesian war; because Thucydides himself maketh no mention of such return, though he outlived the whole war, as is manifest by his words in the fifth book. For he saith he lived in banishment twenty years after his charge at Amphipolis; which happened in the eighth year of this war: which, in the whole, lasted but twenty-seven years complete. And in another place he maketh mention of the razing of the long walls between Peiræus and the city; which was the last stroke of this war. They that say he died at Athens, take their conjecture from his monument which was there. But this is not a sufficient argument; for he might be buried there secretly, (as some have written he was), though he died abroad: or his monument might be there, and (as others have affirmed) he not buried in it. In this variety of conjecture, there is nothing more probable than that which is written by Pausanias, where he describeth the monuments of the Athenian city; and saith thus: “The worthy act of Cænobius in the behalf of Thucydides, is not without honour”: meaning that he had a statue. “For

Cenobius obtained to have a decree passed for his return; who returning was slain by treachery; and his sepulchre is near the gates called Melitides.” He died, as saith Marcellinus, after the seven and fiftieth year of his age. And if it be true that is written by A. Gellius, of the ages of Hellanicus, Herodotus, and Thucydides, then died he not before the sixty–eighth year. For if he were forty when the war began, and lived (as he did certainly) to see it ended, he might be more when he died, but not less than sixty–eight years of age. What children he left, is not manifest. Plato in Menone, maketh mention of Milesias and Stephanus, sons of a Thucydides of a very noble family; but it is clear they were of Thucydides the rival of Pericles, both by the name Milesias, and because this Thucydides also was of the family of Miltiades, as Plutarch testifieth in the life of Cimon. That he had a son, is affirmed by Marcellinus out of the authority of Polemon; but of his name there is no mention, save that a learned man readeth there in the place of Θεο (which is in the imperfect copy), Timotheus. Thus much of the person of Thucydides.

Now for his writings, two things are to be considered in them: truth and elocution. For in truth consisteth the soul, and in elocution the body of history. The latter without the former, is but a picture of history; and the former without the latter, unapt to instruct. But let us see how our author hath acquitted himself in both. For the faith of this history, I shall have the less to say: in respect that no man hath ever yet called it into question. Nor indeed could any man justly doubt of the truth of that writer, in whom they had nothing at all to suspect of those things that could have caused him either voluntarily to lie, or ignorantly to deliver an untruth. He overtasked not himself by undertaking an history of things done long before his time, and of which he was not able to inform himself. He was a man that had as much means, in regard both of his dignity and wealth, to find the truth of what he relateth, as was needful for a man to have. He used as much

diligence in search of the truth, (noting every thing whilst it was fresh in memory, and laying out his wealth upon intelligence), as was possible for a man to use. He affected least of any man the acclamations of popular auditories, and wrote not his history to win present applause, as was the use of that age: but for a monument to instruct the ages to come; which he professeth himself, and entitleth his book ΚΤΗΜΑ ΕΣ ΑΕΙ, a possession for everlasting. He was far from the necessity of servile writers, either to fear or flatter. And whereas he may peradventure be thought to have been malevolent towards his country, because they deserved to have him so; yet hath he not written any thing that discovereth such passion. Nor is there any thing written of them that tendeth to their dishonour as Athenians, but only as people; and that by the necessity of the narration, not by any sought digression. So that no word of his, but their own actions do sometimes reproach them. In sum, if the truth of a history did ever appear by the manner of relating, it doth so in this history: so coherent, perspicuous and persuasive is the whole narration, and every part thereof.

In the elocution also, two things are considerable: disposition or method, and style. Of the disposition here used by Thucydides, it will be sufficient in this place briefly to observe only this: that in his first book, first he hath, by way of exordium, derived the state of Greece from the cradle to the vigorous stature it then was at when he began to write: and next, declared the causes, both real and pretended, of the war he was to write of. In the rest, in which he handleth the war itself, he followeth distinctly and purely the order of time throughout; relating what came to pass from year to year, and subdividing each year into a summer and winter. The grounds and motives of every action he setteth down before the action itself, either narratively, or else contriveth them into the form of deliberative orations in the persons of such as from time to time bare sway in the commonwealth. After the actions, when there is just occasion, he giveth his judgment of

them; shewing by what means the success came either to be furthered or hindered. Digressions for instruction's cause, and other such open conveyances of precepts, (which is the philosopher's part), he never useth; as having so clearly set before men's eyes the ways and events of good and evil counsels, that the narration itself doth secretly instruct the reader, and more effectually than can possibly be done by precept.

For his style, I refer it to the judgment of divers ancient and competent judges. Plutarch in his book, *De gloria Atheniensium*, saith of him thus: "Thucydides aimeth always at this; to make his auditor a spectator, and to cast his reader into the same passions that they were in that were beholders. The manner how Demosthenes arranged the Athenians on the rugged shore before Pylus; how Brasidas urged the steersman to run his galley aground; how he went to the ladder or place in the galley for descent; how he was hurt, and swooned, and fell down on the ledges of the galley; how the Spartans fought after the manner of a land-fight upon the sea, and the Athenians of a sea-fight upon land: again, in the Sicilian war, how a battle was fought by sea and land with equal fortune: these things, I say, are so described and so evidently set before our eyes, that the mind of the reader is no less affected therewith than if he had been present in the actions." There is for his perspicuity. Cicero in his book entitled *Orator*, speaking of the affection of divers Greek rhetoricians, saith thus: "And therefore Herodotus and Thucydides are the more admirable. For though they lived in the same age with those I have before named," (meaning Thrasymachus, Gorgias, and Theodorus), "yet were they far from this kind of delicacy, or rather indeed foolery. For the one without rub, gently glideth like a still river; and the other" (meaning Thucydides) "runs stronglier, and in matter of war, as it were, bloweth a trumpet of war. And in these two (as saith Theophrastus) history hath roused herself, and adventured to speak, but more copiously, and with more ornament than in those that were before them." This

commends the gravity and the dignity of his language. Again in his second book, *De Oratore*, thus: “Thucydides, in the art of speaking, hath in my opinion far exceeded them all. For he is so full of matter, that the number of his sentences doth almost reach to the number of his words; and in his words he is so apt and so close, that it is hard to say whether his words do more illustrate his sentences, or his sentences his words.” There is for the pithiness and strength of his style. Lastly, for the purity and propriety, I cite Dionysius Halicarnassius: whose testimony is the stronger in this point, because he was a Greek rhetorician for his faculty, and for his affection, one that would no further commend him than of necessity he must. His words are these: “There is one virtue in eloquence, the chiefest of all the rest, and without which there is no other goodness in speech. What is that? That the language be pure, and retain the propriety of the Greek tongue. This they both observe diligently. For Herodotus is the best rule of the Ionic, and Thucydides of the Attic dialect.” These testimonies are not needful to him that hath read the history itself; nor at all, but that this same Dionysius hath taken so much pains, and applied so much of his faculty in rhetoric, to the extenuating of the worth thereof. Moreover, I have thought it necessary to take out the principal objections he maketh against him; and without many words of mine own to leave them to the consideration of the reader. And first, Dionysius saith thus: “The principal and most necessary office of any man that intendeth to write a history, is to choose a noble argument, and grateful to such as shall read it. And this Herodotus, in my opinion, hath done better than Thucydides. For Herodotus hath written the joint history both of the Greeks and barbarians, to save from oblivion, &c. But Thucydides writeth one only war, and that neither honourable nor fortunate; which principally were to be wished never to have been; and next, never to have been remembered nor known to posterity. And that he took an evil argument in hand, he maketh it manifest in his proeme, saying: that many

cities were in that war made desolate and utterly destroyed, partly by barbarians, partly by the Greeks themselves: so many banishments, and so much slaughter of men, as never was the like before, &c. so that the hearers will abhor it at the first propounding. Now by how much it is better to write of the wonderful acts both of the barbarians and Grecians, than of the pitiful and horrible calamities of the Grecians; so much wiser is Herodotus in the choice of his argument than Thucydides.”

Now let any man consider whether it be not more reasonable to say: That the principal and most necessary office of him that will write a history, is to take such an argument as is both within his power well to handle, and profitable to posterity that shall read it, which Thucydides, in the opinion of all men, hath done better than Herodotus: for Herodotus undertook to write of those things, of which it was impossible for him to know the truth; and which delight more the ear with fabulous narrations, than satisfy the mind with truth: but Thucydides writeth one war; which, how it was carried from the beginning to the end, he was able certainly to inform himself: and by propounding in his proeme the miseries that happened in the same, he sheweth that it was a great war, and worthy to be known; and not to be concealed from posterity, for the calamities that then fell upon the Grecians; but the rather to be truly delivered unto them, for that men profit more by looking on adverse events, than on prosperity: therefore by how much men’s miseries do better instruct, than their good success; by so much was Thucydides more happy in taking his argument, than Herodotus was wise in choosing his.

Dionysius again saith thus: “The next office of him that will write a history, is to know where to begin, and where to end. And in this point Herodotus seemeth to be far more discreet than Thucydides. For in the first place he layeth down the cause for which the barbarians began to injure the Grecians; and going on, maketh an end at the punishment and the revenge

taken on the barbarians. But Thucydides begins at the good estate of the Grecians; which, being a Grecian and an Athenian, he ought not to have done: nor ought he, being of that dignity amongst the Athenians, so evidently to have laid the fault of the war upon his own city, when there were other occasions enough to which he might have imputed it. Nor ought he to have begun with the business of the Corcyræans, but at the more noble acts of his country, which they did immediately after the Persian war: which afterward in convenient place he mentioneth, but it is but cursorily, and not as he ought. And when he had declared those with much affection, as a lover of his country, then he should have brought in, how that the Lacedæmonians, through envy and fear, but pretending other causes, began the war: and so have descended to the Corcyræan business, and the decree against the Megareans, or whatsoever else he had to put in. Then in the ending of his history, there be many errors committed. For though he profess he was present in the whole war, and that he would write it all: yet he ends with the naval battle at Cynos-sema, which was fought in the twenty-first year of the war. Whereas it had been better to have gone through with it, and ended his history with that admirable and grateful return of the banished Athenians from Phile; at which time the city recovered her liberty.”

To this I say, that it was the duty of him that had undertaken to write the history of the Peloponnesian war, to begin his narration no further off than at the causes of the same, whether the Grecians were then in good or in evil estate. And if the injury, upon which the war arose, proceeded from the Athenians; then the writer, though an Athenian and honoured in his country, ought to declare the same; and not to seek nor take, though at hand, any other occasion to transfer the fault. And that the acts done before the time comprehended in the war he writ of, ought to have been touched but cursorily, and no more than may serve for the enlightening of the history to

follow, how noble soever those acts have been. Which when he had thus touched, without affection to either side, and not as a lover of his country but of truth; then to have proceeded to the rest with the like indifferency. And to have made an end of writing, where the war ended, which he undertook to write; not producing his history beyond that period, though that which followed were never so admirable and acceptable. All this Thucydides hath observed.

These two criminations I have therefore set down at large, translated almost verbatim, that the judgment of Dionysius Halicarnassius may the better appear concerning the main and principal virtues of a history. I think there was never written so much absurdity in so few lines. He is contrary to the opinion of all men that ever spake of this subject besides himself, and to common sense. For he makes the scope of history, not profit by writing truth, but delight of the hearer, as if it were a song. And the argument of history, he would not by any means have to contain the calamities and misery of his country; these he would have buried in silence: but only their glorious and splendid actions. Amongst the virtues of an historiographer, he reckons affection to his country; study to please the hearer; to write of more than his argument leads him to; and to conceal all actions that were not to the honour of his country. Most manifest vices. He was a rhetorician; and it seemeth he would have nothing written, but that which was most capable of rhetorical ornament. Yet Lucian, a rhetorician also, in a treatise entitled, *How a history ought to be written*, saith thus: “that a writer of history ought, in his writings, to be a foreigner, without country, living under his own law only, subject to no king, nor caring what any man will like or dislike, but laying out the matter as it is.”

The third fault he finds is this: that the method of his history is governed by the time, rather than the periods of several actions: for he declares in order what came to pass each summer and winter, and is thereby forced

sometimes to leave the narration of a siege, or sedition, or a war, or other action in the midst, and enter into a relation of somewhat else done at the same time, in another place, and to come to the former again when the time requires it. This, saith he, causes confusion in the mind of his hearer, so that he cannot comprehend distinctly the several parts of the history.

Dionysius aimeth still at the delight of the present hearer; though Thucydides himself profess that his scope is not that, but to leave his work for a perpetual possession for posterity: and then have men leisure enough to comprehend him thoroughly. But indeed, whosoever shall read him once attentively, shall more distinctly conceive of every action this way than the other. And the method is more natural; forasmuch as his purpose being to write of one Peloponnesian war, this way he has incorporated all the parts thereof into one body; so that there is unity in the whole, and the several narrations are conceived only as parts of that. Whereas the other way, he had sewed together many little histories, and left the Peloponnesian war, which he took for his subject, in a manner unwritten: for neither any part nor the whole could justly have carried such a title.

Fourthly, he accuseth him for the method of his first book: in that he deriveth Greece from the infancy thereof to his own time: and in that he setteth down the narration of the quarrels about Corcyra and Potidæa, before he entreateth of the true cause of the war; which was the greatness of the Athenian dominion, feared and envied by the Lacedæmonians.

For answer to this, I say thus. For the mentioning of the ancient state of Greece, he doth it briefly, insisting no longer upon it than is necessary for the well understanding of the following history. For without some general notions of these first times, many places of the history are the less easy to be understood; as depending upon the knowledge of the original of several cities and customs, which could not be at all inserted into the history itself, but must be either supposed to be foreknown by the reader, or else be

delivered to him in the beginning as a necessary preface. And for his putting first the narration of the public and avowed cause of this war, and after that the true and inward motive of the same; the reprehension is absurd. For it is plain, that a cause of war divulged and avowed, how slight soever it be, comes within the task of the historiographer, no less than the war itself. For without a pretext, no war follows. This pretext is always an injury received, or pretended to be received. Whereas the inward motive to hostility is but conjectural; and not of that evidence, that a historiographer should be always bound to take notice of it: as envy to the greatness of another state, or fear of an injury to come. Now let any man judge, whether a good writer of history ought to handle, as the principal cause of war, proclaimed injury or concealed envy. In a word, the image of the method used by Thucydides in this point, is this: “The quarrel about Corcyra passed on this manner; and the quarrel about Potidæa on this manner”: relating both at large: “and in both the Athenians were accused to have done the injury. Nevertheless, the Lacedæmonians had not upon this injury entered into a war against them, but that they envied the greatness of their power, and feared the consequence of their ambition.” I think a more clear and natural order cannot possibly be devised.

Again he says, that he maketh a funeral oration (which was solemnly done on all occasions through the war) for fifteen horsemen only, that were slain at the brooks called Rheiti: and that for this reason only, that he might make it in the person of Pericles, who was then living, but before another the like occasion happened was dead.

The manner of the Athenians was, that they that were slain the first in any war, should have a solemn funeral in the suburbs of the city. During this war, they had many occasions to put this custom in practice. Seeing therefore it was fit to have that custom and the form of it known, and that once for all, the manner being ever the same; it was the fittest to relate it on

the first occasion, what number soever they were that were then buried: which nevertheless is not likely to have been so few as Dionysius saith. For the funeral was not celebrated till the winter after they were slain: so that many more were slain before this solemnity, and may all be accounted amongst the first. And that Pericles performed the office of making their funeral oration, there is no reason alledged by him why it should be doubted.

Another fault he finds, is this: that he introduceth the Athenian generals, in a dialogue with the inhabitants of the Isle of Melos, pretending openly for the cause of their invasion of that isle, the power and will of the state of Athens; and rejecting utterly to enter into any disputation with them concerning the equity of their cause, which, he saith, was contrary to the dignity of the state.

To this may be answered, that the proceeding of these generals was not unlike to divers other actions, that the people of Athens openly took upon them: and therefore it is very likely they were allowed so to proceed. Howsoever, if the Athenian people gave in charge to these their captains, to take in the island by all means whatsoever, without power to report back unto them first the equity of the islanders' cause; as is most likely to be true; I see then no reason the generals had to enter into disputation with them, whether they should perform their charge or not, but only whether they should do it by fair or foul means; which is the point treated of in this dialogue. Other cavils he hath touching the matter and order of this history, but not needful to be answered.

Then for his phrase, he carpeth at it in infinite places, both for obscure and licentious. He that will see the particular places he reprehendeth, let him read Dionysius himself, if he will: for the matter is too tedious for this place. It is true, that there be some sentences in him somewhat long: not obscure to one that is attentive: and besides that, they are but few. Yet is this

the most important fault he findeth. For the rest, the obscurity that is, proceedeth from the profoundness of the sentences; containing contemplations of those human passions, which either dissembled or not commonly discoursed of, do yet carry the greatest sway with men in their public conversation. If then one cannot penetrate into them without much meditation, we are not to expect a man should understand them at the first speaking. Marcellinus saith, he was obscure on purpose; that the common people might not understand him. And not unlikely: for a wise man should so write, (though in words understood by all men), that wise men only should be able to commend him. But this obscurity is not to be in the narrations of things done, nor in the descriptions of places or of battles, in all which Thucydides is most perspicuous: as Plutarch in the words before cited hath testified of him. But in the characters of men's humours and manners, and applying them to affairs of consequence: it is impossible not to be obscure to ordinary capacities, in what words soever a man deliver his mind. If therefore Thucydides in his orations, or in the description of a sedition, or other thing of that kind, be not easily understood; it is of those only that cannot penetrate into the nature of such things, and proceedeth not from any intricacy of expression. Dionysius further findeth fault with his using to set word against word: which the rhetoricians call antitheta. Which, as it is in some kind of speech a very great vice, so is it not improper in characters: and of comparative discourses, it is almost the only style.

And whereas he further taxeth him for licentiousness in turning nouns into verbs, and verbs into nouns, and altering of genders, cases, and numbers; as he doth sometimes for the more efficacy of his style, and without solœcism; I leave him to the answer of Marcellinus: who says, "That Dionysius findeth fault with this, as being ignorant" (yet he was a professed rhetorician) "that this was the most excellent and perfect kind of speaking."

Some man may peradventure desire to know, what motive Dionysius might have to extenuate the worth of him, whom he himself acknowledgeth to have been esteemed by all men for the best by far of all historians that ever wrote, and to have been taken by all the ancient orators and philosophers for the measure and rule of writing history. What motive he had to it, I know not: but what glory he might expect by it, is easily known. For having first preferred Herodotus, his countryman, a Halicarnassian, before Thucydides, who was accounted the best; and then conceiving that his own history might perhaps be thought not inferior to that of Herodotus: by this computation he saw the honour of the best historiographer falling on himself. Wherein, in the opinion of all men, he hath misreckoned. And thus much for the objections of Denis of Halicarnasse.

It is written of Demosthenes, the famous orator, that he wrote over the history of Thucydides with his own hand eight times. So much was this work esteemed, even for the eloquence. But yet was this his eloquence not at all fit for the bar; but proper for history, and rather to be read than heard. For words that pass away (as in public orations they must) without pause, ought to be understood with ease, and are lost else: though words that remain in writing for the reader to meditate on, ought rather to be pithy and full. Cicero therefore doth justly set him apart from the rank of pleaders; but withal, he continually giveth him his due for history, (lib. ii. De Oratore): “What great rhetorician ever borrowed any thing of Thucydides? Yet all men praise him, I confess it, as a wise, severe, grave relator of things done: not for a pleader of causes at the bar, but a reporter of war in history. So that he was never reckoned an orator: nor if he had never written a history, had his name therefore not been extant, being a man of honour and nobility. Yet none of them imitate the gravity of his words and sentences; but when they have uttered a kind of lame and disjointed stuff, they presently think themselves brothers of Thucydides.” Again, in his book De Optimo

Oratore, he saith thus: “But here will stand up Thucydides: for his eloquence is by some admired; and justly. But this is nothing to the orator we seek: for it is one thing to unfold a matter by way of narration; another thing to accuse a man, or clear him by arguments. And in narrations, one thing to stay the hearer, another to stir him.” Lucian, in his book entitled *How a history ought to be written*, doth continually exemplify the virtues which he requires in an historiographer by Thucydides. And if a man consider well that whole discourse of his, he shall plainly perceive that the image of this present history, preconceived in Lucian’s mind, suggested unto him all the precepts he there delivereth. Lastly, hear the most true and proper commendation of him from Justus Lipsius, in his notes to his book *De Doctrina Civili* in these words: “Thucydides, who hath written not many nor very great matters, hath perhaps yet won the garland from all that have written of matters both many and great. Everywhere for elocution grave; short, and thick with sense; sound in his judgments; everywhere secretly instructing and directing a man’s life and actions. In his orations and excursions, almost divine. Whom the oftener you read, the more you shall carry away; yet never be dismissed without appetite. Next to him is Polybius, &c.”

And thus much concerning the life and history of Thucydides.

THE FIRST BOOK OF THE HISTORY OF THUCYDIDES.

THE PRINCIPAL CONTENTS.

THE ESTATE OF Greece, derived from the remotest known antiquity thereof, to the beginning of the Peloponnesian War. — The occasion and pretexts of this war, arising from the controversies of the Athenians with the Corinthians concerning Corcyra and Potidæa. — The Lacedæmonians, instigated by the confederates, undertake the war; not so much at their instigation, as of envy to the greatness of the Athenian dominion. — The degrees by which that dominion was acquired. — The war generally decreed by the confederates at Sparta. — The demands of the Lacedæmonians. — The obstinacy of the Athenians; and their answer by the advice of Pericles.

To make it appear that this war was greater than any before it, the author sheweth the imbecility of former times; describing three periods: 1. From the beginning of the Grecian memory to the war of Troy. 2. The war itself. 3. The time from thence to the present war which he writeth.

Thucydides, an Athenian, wrote the war of the Peloponnesians and the Athenians as they warred against each other, beginning to write as soon as the war was on foot; with expectation it should prove a great one, and most worthy the relation of all that had been before it: conjecturing so much, both from this, that they flourished on both sides in all manner of provision; and also because he saw the rest of Greece siding with the one or the other faction, some then presently and some intending so to do. For this was certainly the greatest commotion that ever happened amongst the Grecians, reaching also to part of the barbarians, and, as a man may say, to most nations. For the actions that preceded this, and those again that are yet more

ancient, though the truth of them through length of time cannot by any means clearly be discovered; yet for any argument that, looking into times far past, I have yet light on to persuade me, I do not think they have been very great, either for matter of war or otherwise.

The state of Greece before the Trojan war.

For it is evident that that which now is called Hellas, was not of old constantly inhabited; but that at first there were often removals, every one easily leaving the place of his abode to the violence always of some greater number. For whilst traffic was not, nor mutual intercourse but with fear, neither by sea nor land; and every man so husbanded the ground as but barely to live upon it, without any stock of riches, and planted nothing; (because it was uncertain when another should invade them and carry all away, especially not having the defence of walls); but made account to be masters, in any place, of such necessary sustenance as might serve them from day to day: they made little difficulty to change their habitations. And for this cause they were of no ability at all, either for greatness of cities or other provision. But the fattest soils were always the most subject to these changes of inhabitants; as that which is now called Thessalia, and Bœotia, and the greatest part of Peloponnesus, except Arcadia; and of the rest of Greece, whatsoever was most fertile. For the goodness of the land increasing the power of some particular men, both caused seditions, whereby they were ruined at home; and withal made them more obnoxious to the insidiation of strangers. From hence it is that Attica, from great antiquity for the sterility of the soil free from seditions, hath been inhabited ever by the same people. And it is none of the least evidences of what I have said, that Greece, by reason of sundry transplantations, hath not in other parts received the like augmentation. For such as by war or sedition were driven out of other places, the most potent of them, as to a place of stability, retired themselves to Athens; where receiving the freedom of the

city, they long since so increased the same in number of people, as Attica, being incapable of them itself, they sent out colonies into Ionia.

The original of the name of Hellas. The name of Hellenes not given to all the Grecians in the time that Homer wrote his poems. The Trojan war was the first enterprise where the Grecians combined their forces.

And to me the imbecility of ancient times is not a little demonstrated also by this [that followeth]. For before the Trojan war nothing appeareth to have been done by Greece in common; nor indeed was it, as I think, called all by that one name of Hellas; nor before the time of Hellen, the son of Deucalion, was there any such name at all. But Pelasgicum (which was the farthest extended) and the other parts, by regions, received their names from their own inhabitants. But Hellen and his sons being strong in Phthiotis, and called in for their aid into other cities; these cities, because of their conversing with them, began more particularly to be called Hellenes: and yet could not that name of a long time after prevail upon them all. This is conjectured principally out of Homer. For though born long after the Trojan war, yet he gives them not anywhere that name in general; nor indeed to any but those that with Achilles came out of Phthiotis, and were the first so called: but in his poems he mentioneth Danaans, Argives, and Achæans. Nor doth he likewise use the word barbarians; because the Grecians, as it seemeth unto me, were not yet distinguished by one common name of Hellenes, oppositely answerable unto them. The Grecians then, neither as they had that name in particular by mutual intercourse, nor after, universally so termed, did ever before the Trojan war, for want of strength and correspondence, enter into any action with their forces joined. And to that expedition they came together by the means of navigation, which the most part of Greece had now received.

Minos, king of Creta, the first that had a navy.

For Minos was the most ancient of all that by report we know to have built a navy. And he made himself master of the now Grecian Sea; and both commanded the isles called Cyclades, and also was the first that sent colonies into most of the same, expelling thence the Carians and constituting his own sons there for governors; and also freed the seas of pirates as much as he could, for the better coming in, as is likely, of his own revenue.

A digression touching the piracies and robberies of old time; with other notes of savageness. Robbing had in honour.

For the Grecians in old time, and such barbarians as in the continent lived near unto the sea, or else inhabited the islands, after once they began to cross over one to another in ships, became thieves, and went abroad under the conduct of their most puissant men, both to enrich themselves and to fetch in maintenance for the weak; and falling upon towns unfortified and scatteringly inhabited, rifled them, and made this the best means of their living; being a matter at that time nowhere in disgrace, but rather carrying with it something of glory. This is manifest by some that dwell on the continent, amongst whom, so it be performed nobly, it is still esteemed as an ornament. The same also is proved by some of the ancient poets, who introduce men questioning of such as sail by, on all coasts alike, whether they be thieves or not; as a thing neither scorned by such as were asked, nor upbraided by those that were desirous to know. They also robbed one another within the main land. And much of Greece useth that old custom, as the Locrians called Ozolæ, the Acarnanians, and those of the continent in that quarter, unto this day. Moreover, the fashion of wearing iron remaineth yet with the people of that continent from their old trade of thieving.

Continual wearing of armour in fashion. The Athenians grew first civil.

For once they were wont throughout all Greece to go armed, because their houses were unfenced and travelling was unsafe; and accustomed

themselves, like the barbarians, to the ordinary wearing of their armour. And the nations of Greece that live so yet, do testify that the same manner of life was anciently universal to all the rest. Amongst whom, the Athenians were the first that laid by their armour, and growing civil, passed into a more tender kind of life. And such of the rich as were anything stepped into years, laid away upon the same delicacy, not long after, the fashion of wearing linen coats and golden grasshoppers, which they were wont to bind up in the locks of their hair. From whence also the same fashion, by reason of their affinity, remained a long time in use amongst the ancient Ionians. But the moderate kind of garment, and conformable to the wearing of these times, was first taken up by the Lacedæmonians; amongst whom also, both in other things and especially in the culture of their bodies, the nobility observed the most equality with the commons. The same were also the first, that when they were to contend in the Olympic games, stripped themselves naked and anointed their bodies with ointment: whereas in ancient times, the champions did also in the Olympic games use breeches; nor is it many years since this custom ceased. Also there are to this day amongst the barbarians, especially those of Asia, prizes propounded of fighting with fists and of wrestling, and the combatants about their privy parts wear breeches in the exercise. It may likewise by many other things be demonstrated, that the old Greeks used the same form of life that is now in force amongst the barbarians of the present age.

The cities of Greece, how seated, and for what causes.

As for cities, such as are of late foundation and since the increase of navigation, inasmuch as they have had since more plenty of riches, have been walled about and built upon the shore; and have taken up isthmi, [that is to say, necks of land between sea and sea], both for merchandise and for the better strength against confiners. But the old cities, men having been in those times for the most part infested by thieves, are built farther up, as well

in the islands as in the continent. For others also that dwelt on the sea-side, though not seamen, yet they molested one another with robberies. And even to these times, those people are planted up high in the country.

The Carians and Phœnicians were those that committed the most robberies.

But these robberies were the exercise especially of the islanders, namely, the Carians and the Phœnicians. For by them were the greatest part of the islands inhabited; a testimony whereof is this. The Athenians, when in this present war they hallowed the isle of Delos and had digged up the sepulchres of the dead, found that more than half of them were Carians; known so to be, both by the armour buried with them, and also by their manner of burial at this day. And when Minos his navy was once afloat, navigators had the sea more free. For he expelled the malefactors out of the islands, and in the most of them planted colonies of his own. By which means they who inhabited the sea-coasts, becoming more addicted to riches, grew more constant to their dwellings; of whom some, grown now rich, compassed their towns about with walls. For out of desire of gain, the meaner sort underwent servitude with the mighty; and the mighty with their wealth brought the lesser cities into subjection. And so it came to pass, that rising to power they proceeded afterward to the war against Troy.

The action of Troy. Peloponnesus, so called from Pelops. The increase of the power of the Pelopians. Atreus king of Mycenæ after the death of Pelops.

And to me it seemeth that Agamemnon got together that fleet, not so much for that he had with him the suitors of Helena, bound thereto by oath to Tindareus, as for this, that he exceeded the rest in power. For they that by tradition of their ancestors know the most certainty of the acts of the Peloponnesians, say that first Pelops, by the abundance of his wealth which he brought with him out of Asia to men in want, obtained such power

amongst them, as, though he were a stranger, yet the country was called after his name; and that this power was also increased by his posterity. For Euristheus being slain in Attica by the Heracleides, Atreus, that was his uncle by the mother, and was then abiding with him as an exiled person for fear of his father for the death of Chrysippus, and to whom Euristheus, when he undertook the expedition, had committed Mycenæ and the government thereof, for that he was his kinsman; when as Euristheus came not back, (the Mycenians being willing to it for fear of the Heracleides, and because he was an able man and made much of the common people), obtained the kingdom of Mycenæ, and of whatsoever else was under Euristheus, for himself; and the power of the Pelopides became greater than that of the Perseides. To which greatness Agamemnon succeeding, and also far excelling the rest in shipping, took that war in hand, as I conceive it, and assembled the said forces, not so much upon favour as by fear. For it is clear, that he himself both conferred most ships to that action, and that some also he lent to the Arcadians. And this is likewise declared by Homer, (if any think his testimony sufficient); who, at the delivery of the sceptre unto him, calleth him, “of many isles and of all Argos King.” Now he could not, living in the continent, have been lord of the islands, other than such as were adjacent, which cannot be many, unless he had also had a navy. And by this expedition we are to estimate what were those of the ages before it.

Mycenæ, though no great city, yet was of great power. The city of Sparta less, and the city of Athens greater, than for the proportion of their power. A survey of the fleetsent to Troy.

Now seeing Mycenæ was but a small city, or if any other of that age seem but of light regard, let not any man for that cause, on so weak an argument, think that fleet to have been less than the poets have said, and fame reported it to be. For if the city of Lacedæmon were now desolate, and nothing of it left but the temples and floors of the buildings, I think it would

breed much unbelief in posterity long hence of their power in comparison of the fame. For although of five parts of Peloponnesus it possess two, and hath the leading of the rest, and also of many confederates without; yet the city being not close built, and the temples and other edifices not costly, and because it is but scatteringly inhabited after the ancient manner of Greece, their power would seem inferior to the report. Again, the same things happening to Athens, one would conjecture, by the sight of their city, that their power were double to what it is. We ought not therefore to be incredulous [concerning the forces that went to Troy], nor have in regard so much the external show of a city as the power: but we are to think, that that expedition was indeed greater than those that went before it, but yet inferior to those of the present age; if in this also we may credit the poetry of Homer, who being a poet was like to set it forth to the utmost. And yet even thus it cometh short. For he maketh it to consist of twelve hundred vessels; those that were of Bœotians carrying one hundred and twenty men a-piece, and those which came with Philoctetes fifty: setting forth, as I suppose, both the greatest sort and the least; and therefore of the bigness of any of the rest, he maketh in his catalogue no mention at all: but declareth that they who were in the vessels of Philoctetes, served both as mariners and soldiers; for he writes, that they who were at the oar, were all of them archers. And for such as wrought not, it is not likely that many went along, except kings and such as were in chief authority; especially being to pass the sea with munition of war, and in bottoms without decks, built after the old and piratical fashion. So then, if by the greatest and least one estimate the mean of their shipping, it will appear that the whole number of men considered as sent jointly from all Greece, were not very many.

The poverty of the Greeks was the cause why the Trojans could so long hold out.

And the cause hereof was not so much want of men, as of wealth. For, for want of victual they carried the lesser army, and no greater than they hoped might both follow the war and also maintain itself. When upon their arrival they had gotten the upper hand in fight, (which is manifest; for else they could not have fortified their camp), it appears that from that time forward they employed not there their whole power, but that for want of victual they betook themselves, part of them to the tillage of Chersonesus, and part to fetch in booties; whereby divided, the Trojans the more easily made that ten years resistance, as being ever a match for so many as remained at the siege. Whereas, if they had gone furnished with store of provision, and with all their forces, eased of boot-haling and tillage, since they were masters of the field, they had also easily taken the city. But they strove not with their whole power, but only with such a portion of their army as at the several occasions chanced to be present; when as, if they had pressed the siege, they had won the place both in less time and with less labour. But through want of money, not only they were weak matters, all that preceded this enterprise; but also this, which is of greater name than any before it, appeareth to be in fact beneath the fame and report, which by means of the poets now goeth of it.

The state of Greece after the Trojan war. A. C. 1124. A. 1m. Ol. 347. Bœotia, more anciently Cadmeis. A. C. 1104. A. 1m. Ol. 327. The Ionians were the colonies of the Athenians.

For also after the Trojan war the Grecians continued still their shiftings and transplantations; insomuch as never resting, they improved not their power. For the late return of the Greeks from Ilium caused not a little innovation; and in most of the cities there arose seditions; and those which were driven out, built cities for themselves in other places. For those that are now called Bœotians, in the sixtieth year after the taking of Troy, expelled Arne by the Thessalians, seated themselves in that country, which

now Bœotia, was then called Cadmeis. (But there was in the same country a certain portion of that nation before, of whom also were they that went to the warfare of Troy). And in the eightieth year, the Dorians together with the Heracleides seized on Peloponnesus. And with much ado, after long time, Greece had constant rest; and shifting their seats no longer, at length sent colonies abroad. And the Athenians planted Ionia and most of the islands; and the Peloponnesians most of Italy and Sicily, and also certain parts of the rest of Greece. But these colonies were all planted after the Trojan war.

The difference between tyranny and regal authority. At Corinth were made the first triremes, or gallies of three tire of oars one above another. A. C. 704. Olym. 1. A. C. 667. Olym. 2. The means of the wealth of Corinth. Corinth surnamed the rich. The Ionians had a navy in Cyrus' time. Polycrates, tyrant of Samos, had a navy in the time of Cambyses. About A. C. 600. Olym.

But when the power of Greece was now improved, and the desire of money withal, their revenues being enlarged, in most of the cities there were erected tyrannies: (for before that time, kingdoms with honours limited were hereditary): and the Grecians built navies, and became more seriously addicted to the affairs of the sea. The Corinthians are said to have been the first that changed the form of shipping into the nearest to that which is now in use; and at Corinth are reported to have been made the first gallies of all Greece. Now it is well known that Aminocles, the ship-wright of Corinth, built four ships at Samos: and from the time that Aminocles went to Samos until the end of this present war, are at the most but three hundred years. And the most ancient naval battle that we know of, was fought between the Corinthians and the Corcyræans; and from that battle to the same time, are but two hundred and sixty years. For Corinth, seated on an isthmus, had been always a place of traffic; (because the Grecians of old,

from within and without Peloponnesus, trading by land more than by sea, had no other intercourse one to another but through the Corinthians' territory); and was also wealthy in money, as appears by the poets, who have surnamed this town the rich. And after the Grecians had commerce also by sea, then likewise having furnished themselves with a navy, they scoured the sea of pirates; and affording traffic both by sea and land, mightily increased their city in revenue of money. After this, the Ionians, in the times of Cyrus first king of the Persians, and of his son Cambyses, got together a great navy; and making war on Cyrus, obtained for a time the dominion of that part of the sea that lieth on their own coast. Also Polycrates, who in the time of Cambyses tyrannised in Samos, had a strong navy, wherewith he subdued divers of the islands; and amongst the rest having won Rhenea, he consecrated the same to Apollo of Delos. The Phocæans likewise, when they were building the city of Marseilles, overcame the Carthaginians in a fight at sea.

The shipping of Greece very mean before this war. A. C. 493. Ol. 71. 4.

These were the greatest navies extant. And yet even these, though many ages after the time of Troy, consisted, as it seems, but of a few galleys, and were made up with vessels of fifty oars and with long boats, as well as those of former times. And it was but a little before the Medan war and death of Darius, successor of Cambyses in the kingdom of Persia, that the tyrants of Sicily and the Corcyræans had of galleys any number. For these last were the only navies worth speaking of in all Greece, before the invasion of the Medes. And the people of Ægina and the Athenians had but small ones, and the most of them consisting but of fifty oars a-piece; and that so lately, as but from the time that the Athenians making war on Ægina, and withal expecting the coming of the barbarian, at the persuasion of Themistocles built those ships which they used in that war. And these also not all had decks.

The causes why the Grecians never joined their forces in any great action.

Such were then the navies of the Greeks, both ancient and modern. Nevertheless, such as applied themselves to naval business gained by them no small power, both in revenue of money and in dominion over other people. For with their navies (especially those men that had not sufficient land, where they inhabited, to maintain themselves) they subdued the islands. But as for war by land, such as any state might acquire power by, there was none at all: and such as were, were only between borderer and borderer. For the Grecians had never yet gone out with any army to conquer any nation far from home; because the lesser cities neither brought in their forces to the great ones, as subjects, nor concurred as equals in any common enterprise; but such as were neighbours warred against each other hand to hand. For the war of old between the Chalcideans and the Eretrians was it wherein the rest of Greece was most divided and in league with either party.

The Ionians kept down by the Persians.

As others by other means were kept back from growing great, so also the Ionians by this: that the Persian affairs prospering, Cyrus and the Persian kingdom, after the defeat of Cræsus, made war upon all that lieth from the river Halys to the sea-side, and so subdued all the cities which they possessed in the continent: and Darius afterward, when he had overcome the Phœnician fleet, did the like unto them in the islands.

C. 548. Ol. 58. 1.

And as for the tyrants that were in the Grecian cities, who forecasted only for themselves, how with as much safety as was possible to look to their own persons and their own families, they resided for the most part in the cities and did no action worthy of memory, unless it were against their neighbours. For as for the tyrants of Sicily, they were already arrived at greater power. Thus was Greece for a long time hindered, that neither

jointly it could do anything remarkable, nor the cities singly be adventurous.

The Lacedæmonians put down the tyrants through all Greece. A. C. 510. Ol. 67. 2. A. C. 804. A. C. 490. Ol. 72. 3. Olym. 1. All Greece divided into two leagues; the Lacedæmonians and their league, and the Athenians and their league.

But after that the tyrants, both of Athens and of the rest of Greece where tyrannies were, were the most and last of them, excepting those of Sicily, put down by the Lacedæmonians; (for Lacedæmon, after that it was built by the Dorians that inhabited the same, though it hath been longer troubled with seditions than any other city we know, yet hath it had for the longest time good laws, and been also always free from tyrants: for it is unto the end of this war four hundred years and something more, that the Lacedæmonians have used one and the same government, and thereby being of power themselves, they also ordered the affairs in the other cities); I say, after the dissolution of tyrannies in Greece, it was not long before the battle was fought by the Medes against the Athenians in the fields of Marathon. And in the tenth year again after that, came the barbarian with the great fleet into Greece, to subdue it. And Greece being now in great danger, the leading of the Grecians that leagued in that war was given to the Lacedæmonians, as to the most potent state. And the Athenians, who had purposed so much before and already stowed their necessities, at the coming in of the Medes went a ship-board and became seamen. When they had jointly beaten back the barbarian, then did the Grecians, both such as were revolted from the king and such as had in common made war upon him, not long after divide themselves into leagues, one part with the Athenians and the other with the Lacedæmonians; these two cities appearing to be the mightiest; for this had the power by land, and the other by sea. But this confederation lasted but awhile: for afterwards the

Lacedæmonians and the Athenians, being at variance, warred each on other together with their several confederates. And the rest of Greece, where any discord chanced to arise, had recourse presently to one of these. In so much, that from the war of the Medes to this present war being continually [exercised] sometimes in peace sometimes in war, either one against the other or against revolted confederates, they arrived at this war, both well furnished with military provisions and also expert; because their practice was with danger.

The manner how the Lacedæmonians dealt with their confederates. The manner how the Athenians handled their confederates.

The Lacedæmonians governed not their confederates so as to make them tributaries, but only drew them by fair means to embrace the oligarchy, convenient to their own policy. But the Athenians, having with time taken into their hands the galleys of all those that stood out, (except the Chians and Lesbians), reigned over them, and ordained every of them to pay a certain tribute of money. By which means, their own particular provision was greater in the beginning of this war, than when in their flourishing time, the league between them and the rest of Greece remaining whole, it was at the most.

Such then I find to have been the state of things past; hard to be believed, though one produce proof for every particular thereof. For men receive the report of things, though of their own country, if done before their own time, all alike, from one as from another, without examination.

Digression to show how negligently men receive the fame of things past, by the example of their error touching the story of Hippias the son of Pisistratus: which it seems he willingly mentions, both here and hereafter, on light occasion. A. C. 514. Ol. 46. 2.

For the vulgar sort of Athenians think that Hipparchus was the tyrant, and slain by Harmodius and Aristogeiton: and know not that Hippias had

the government, as being the eldest son of Pisistratus, and that Hipparchus and Thessalus were his brethren; and that Harmodius and Aristogeiton, suspecting that some of their complices had that day, and at that instant, discovered unto Hippias somewhat of their treason, did forbear Hippias as a man forewarned; and desirous to effect somewhat, though with danger, before they should be apprehended, lighting on Hipparchus slew him near the temple called Leocorium, whilst he was setting forth the Panathenaical show. And likewise divers other things now extant, and which time hath not yet involved in oblivion, have been conceived amiss by other Grecians; as that the kings of Lacedæmon, in giving their suffrages, had not single, but double votes: and that Pitonate was a band of soldiers so called there; whereas there was never any such. So impatient of labour are the most men in search of truth, and embrace soonest the things that are next to hand.

Now he, that by the arguments here adduced, shall frame a judgment of the things past, and not believe rather that they were such as the poets have sung, or prose-writers have composed, more delightfully to the ear than conformably to the truth, as being things not to be disproved, and by length of time turned for the most part into the nature of fables without credit; but shall think them here searched out by the most evident signs that can be, and sufficiently too, considering their antiquity; he, I say, shall not err. And though men always judge the present war wherein they live to be greatest, and when it is past, admire more those that were before it; yet if they consider of this war by the acts done in the same, it will manifest itself to be greater than any of those before mentioned.

The diligence of the author in the inquiry of the truth of what he wrote: both touching the orations and the actions.

What particular persons have spoken when they were about to enter into the war or when they were in it, were hard for me to remember exactly; whether they were speeches which I have heard myself, or have received at

the second hand. But as any man seemed to me, that knew what was nearest to the sum of the truth of all that had been uttered, to speak most agreeably to the matter still in hand, so I have made it spoken here. But of the acts themselves done in the war, I thought not fit to write all that I heard from all authors, nor such as I myself did but think to be true; but only those whereat I was myself present, and those of which with all diligence I had made particular inquiry. And yet even of those things it was hard to know the certainty; because such as were present at every action, spake not all after the same manner; but as they were affected to the parts, or as they could remember.

The use of this history.

To hear this history rehearsed, for that there be inserted in it no fables, shall be perhaps not delightful. But he that desires to look into the truth of things done, and which (according to the condition of humanity) may be done again, or at least their like, he shall find enough herein to make him think it profitable. And it is compiled rather for an everlasting possession, than to be rehearsed for a prize.

The greatness of the present war. Earthquakes, eclipses, famine, pestilence, concomitants of this war. A. C. 415. Ol. 83. 3. The causes of the war. Fear necessitates the war in the Lacedæmonians.

The greatest action before this was that against the Medes; and yet that, by two battles by sea and as many by land, was soon decided. But as for this war, it both lasted long, and the harm it did to Greece was such, as the like in the like space had never been seen before. For neither had there ever been so many cities expugned and made desolate, what by the barbarians and what by the Greeks warring on one another; (and some cities there were, that when they were taken changed their inhabitants); nor so much banishing and slaughter, some by the war some by sedition, as was in this. And those things which concerning former time there went a fame of, but in

fact rarely confirmed, were now made credible: as earthquakes, general to the greatest part of the world, and most violent withal: eclipses of the sun, oftener than is reported of any former time: great droughts in some places, and thereby famine: and that which did none of the least hurt, but destroyed also its part, the plague. All these evils entered together with this war: which began from the time that the Athenians and Peloponnesians brake the league, which immediately after the conquest of Eubœa had been concluded between them for thirty years. The causes why they brake the same, and their quarrels, I have therefore set down first, because no man should be to seek from what ground so great a war amongst the Grecians could arise. And the truest quarrel, though least in speech, I conceive to be the growth of the Athenian power; which putting the Lacedæmonians into fear necessitated the war. But the causes of the breach of the league publicly voiced, were these.

The first pretext. A. C. 627. Ol. 38. 2.

Epidamnus is a city situate on the right hand to such as enter into the Ionian Gulf. Bordering upon it are the Taulantii, barbarians, a people of Illyris. This was planted by the Corcyræans; but the captain of the colony was one Phalius, the son of Heratoclidus, a Corinthian of the lineage of Hercules, and, according to an ancient custom, called to this charge out of the metropolitan city. Besides that, the colony itself consisted in part of Corinthians, and others of the Doric nation. In process of time the city of Epidamnus became great and populous; and having for many years together been annoyed with sedition, was by a war, as is reported, made upon them by the confining barbarians, brought low and deprived of the greatest part of their power. But that which was the last accident before this war, was, that the nobility, forced by the commons to fly the city, went and joined with the barbarians, and both by land and sea robbed those that remained within. The Epidamnians that were in the town, oppressed in this manner,

sent their ambassadors to Corcyra, as being their mother city, praying the Corcyraeans not to see them perish, but to reconcile unto them those whom they had driven forth, and to put an end to the barbarian war. And this they entreated in the form of suppliants, sitting down in the temple of Juno. But the Corcyraeans, not admitting their supplication, sent them away again without effect.

The Epidamnians neglected by their mother city Corcyra, procure the protection of the Corinthians. A. C. 436. Ol. 86. 1. A. C. 436. Ol. 85. 4./86. 1.

The Epidamnians now despairing of relief from the Corcyraeans, and at a stand how to proceed in their present affairs, sending to Delphi enquired at the oracle, whether it were not best to deliver up their city into the hands of the Corinthians as of their founders, and make trial what aid they should obtain from thence. And when the oracle had answered, that they should deliver it and take the Corinthians for their leaders, they went to Corinth, and according to the advice of the oracle gave their city to them, and declared how the first founder of it was a Corinthian, and what answer the oracle had given them, entreating their help, and that they would not stand by beholding their destruction. And the Corinthians undertook their defence, not only for the equity of the cause, as thinking them no less their own than the Corcyraeans' colony, but also for hatred of the Corcyraeans; who being their colony yet contemned them, and allowed them not their due honour in public meetings, nor in the distribution of the sacrifice began at a Corinthian, as was the custom of other colonies; but being equal to the richest Grecians of their time for store of money, and strongly furnished with ammunition of war, had them in contempt. Also they stuck not sometimes to boast how much they excelled in shipping; and that Corcyra had been once inhabited by the Phæaces, who flourished in glory of naval affairs: which was also the cause why they the rather provided themselves

of a navy. And they were indeed not without power that way; for when they began this war, they had one hundred and twenty galleys.

The Corinthians send inhabitants to Epidamnus. A. C. 436. Ol. 86. 1. The Corcyræans angry at the aids sent by the Corinthians, make war on Epidamnus. A. C. 436. Ol. 86. 1. The Corcyræans besiege Epidamnus.

The Corinthians therefore having all these crinations against them, relieved Epidamnus willingly, not only giving leave to whosoever would to go and dwell there, but also sent thither a garrison of Ambraciots, Leucadians, and of their own citizens. Which succours, for fear the Corcyræans should have hindered their passage by sea, marched by land to Apollonia. The Corcyræans, understanding that new inhabitants and a garrison were gone to Epidamnus, and that the colony was delivered to the Corinthians, were vexed extremely at the same; and sailing presently thither with twenty-five galleys, and afterwards with another fleet, in an insolent manner commanded them both to recall those whom they had banished, (for these banished men of Epidamnus had been now at Corcyra, and pointing to the sepulchres of their ancestors and claiming kindred, had entreated the Corcyræans to restore them), and to send away the garrison and inhabitants sent thither by the Corinthians. But the Epidamnians gave no ear to their commandments. Whereupon the Corcyræans with forty galleys, together with the banished men, (whom they pretended to reduce), and with the Illyrians, whom they had joined to their part, warred upon them; and having laid siege to the city, made proclamation, that such of the Epidamnians as would, and all strangers, might depart safely, or otherwise were to be proceeded against as enemies. But when this prevailed not, the place being an isthmus, they enclosed the city in on every side.

The Corinthians send an army to relieve it.

The Corinthians, when news was brought from Epidamnus how it was besieged, presently made ready their army: and at the same time caused a

proclamation to be made for the sending thither of a colony, and that such as would go should have equal and like privileges with those that were there before: and that such as desired to be sharers in the same, and yet were unwilling to go along in person at that present, if they would contribute fifty Corinthian drachmas, might stay behind. And they were very many, both that went and that laid down their silver. Moreover they sent to the Megareans, for fear of being stopped in their passage by the Corcyræans, to aid them with some galleys: who accordingly furnished out eight; the citizens of Pale in Cephalaria, four. They also required galleys of the Epidaurians, who sent them five: the citizens of Hermione, one: the Trœzenians, two: the Leucadians, ten: the Ambraciots, eight. Of the Thebans and Phliasians they required money: of the Eleans, both money and empty galleys. And of the Corinthians themselves, there were ready thirty galleys and three thousand men of arms.

C. 435. Ol. 86. 2. The Corcyræans offer to stand to arbitrement. The Corinthians unwilling to accept it, and not without cause.

The Corcyræans, advertised of this preparation, went to Corinth in company of the ambassadors of the Lacedæmonians and of the Sicyonians, whom they took with them; and required the Corinthians to recall the garrison and inhabitants which they had sent to Epidamnus, as being a city, they said, wherewith they had nothing to do; or if they had anything to allege, they were content to have the cause judicially tried in such cities of Peloponnesus as they should both agree on; and they then should hold the colony, to whom the same should be adjudged. They said also, that they were content to refer their cause to the oracle at Delphi: that war they would make none; but if they must needs have it, they should, by the violence of them, be forced in their own defence to seek out better friends than those whom they already had. To this the Corinthians answered, that if they would put off with their fleet and dismiss the barbarians from before

Epidamnus, they would then consult of the matter: for before they could not honestly do it; because whilst they should be pleading the case, the Epidamnians should be suffering the misery of a siege. The Corcyræans replied to this, that if they would call back those men of theirs already in Epidamnus, that then they also would do as the Corinthians had required them; or otherwise they were content to let the men on both sides stay where they were, and to suspend the war till the cause should be decided.

C. 435. Ol. 86. 2. The Corinthian fleet. A. C. 435. Ol. 86. 2. The Corcyræan fleet. The Corcyræans have the victory at sea, and on the same day take the city.

The Corinthians not assenting to any of these propositions, since their galleys were manned and their confederates present, having defied them first by a herald, put to sea with seventy-five galleys and two thousand men of arms, and set sail for Epidamnus against the Corcyræans. Their fleet was commanded by Aristeus the son of Pellicas, Callicrates the son of Callias, and Timanor the son of Timanthes: and the land forces by Archetimus the son of Eurytimus, and Isarchidas the son of Isarchus. After they were come as far as Actium, in the territory of Anactorium, (which is a temple of Apollo, and ground consecrated unto him), in the mouth of the Gulf of Ambracia, the Corcyræans sent a herald to them at Actium, to forbid their coming on; and in the meantime manned out their fleet; and having repaired and made fit for service their old galleys, and furnished the rest with things necessary, shipped their munition and went aboard. The herald was no sooner returned from the Corinthians with an answer not inclining to peace, but having their galleys already manned and furnished to the number of eighty sail, (for forty attended always the siege of Epidamnus), they put to sea, and arranging themselves came to a battle: in which the Corcyræans were clearly victors; and on the part of the Corinthians there perished fifteen galleys. And the same day it happened likewise, that they that

besieged Epidamnus had the same rendered unto them, with conditions, that the strangers therein found should be ransomed, and the Corinthians kept in bonds till such time as they should be otherwise disposed of.

C. 435. Ol. 86. 2. The Corcyræans masters of the sea. A. C. 435. Ol. 86. 2.

The battle being ended, the Corcyræans, after they had set up their trophy in Leucimna, a promontory of Corcyra, slew their other prisoners, but kept the Corinthians still in bonds. After this, when the Corinthians with their vanquished fleet were gone home to Corinth, the Corcyræans, masters now of the whole sea in those parts, went first and wasted the territory of Leucas, a Corinthian colony; and then sailed to Cyllene, which is the arsenal of the Eleans, and burnt it, because they had both with money and shipping given aid to the Corinthians. And they were masters of those seas, and infested the confederates of Corinth, for the most part of that year; till such time as in the beginning of the summer following the Corinthians sent a fleet and soldiers unto Actium, the which, for the more safe keeping of Leucas and of other cities their friends, encamped about Chimerium in Thesprotis: and the Corcyræans, both with their fleet and land soldiers, lay over against them in Leucimna. But neither part stirred against the other; but after they had lyen quietly opposite all the summer, they retired in winter both the one side and the other to their cities.

C. 434. 3. Ol. 86. 3. 4. The Corinthians prepare a greater navy. Both Corcyræans and Corinthians send their ambassadors to Athens. A. C. 433. Ol. 86. 3. 4.

All this year, as well before as after the battle, the Corinthians, being vexed at the war with the Corcyræans, applied themselves to the building of galleys and to the preparing of a fleet, the strongest they were able to make, and to procure mariners out of Peloponnesus and all other parts of Greece. The Corcyræans having intelligence of their preparations, began to fear; and

(because they had never been in league with any Grecian city, nor were in the roll of the confederates either of the Athenians or Lacedæmonians) thought it best now to send to Athens, to see if they could procure any aid from thence. This being perceived by the Corinthians, they also sent their ambassadors to Athens, lest the addition of the Athenian navy to that of the Corcyræans might hinder them from carrying the war as they desired. And the assembly at Athens being met, they came to plead against each other; and the Corcyræans spake to this effect.

C. 433. Ol. 86. 3. 4. oration of the ambassadors of corcyra. A. C. 433. Ol. 86. 3. 4.

“Men of Athens, it is but justice that such as come to implore the aid of their neighbours, (as now do we), and cannot pretend by any great benefit or league some precedent merit, should, before they go any farther, make it appear, principally, that what they seek conferreth profit, or if not so, yet is not prejudicial at least to those that are to grant it: and next, that they will be constantly thankful for the same: and if they cannot do this, then not to take it ill though their suit be rejected. And the Corcyræans being fully persuaded that they can make all this appear on their own parts, have therefore sent us hither, desiring you to ascribe them to the number of your confederates. Now so it is, that we have had a custom, both unreasonable in respect of our suit to you, and also for the present unprofitable to our own estate. For having ever till now been unwilling to admit others into league with us, we are now not only suitors for league to others, but also left destitute by that means of friends in this our war with the Corinthians. And that which before we thought wisdom, namely, not to enter with others into league, because we would not at the discretion of others enter into danger, we now find to have been our weakness and imprudence. Wherefore, though alone we repulsed the Corinthians in the late battle by sea, yet since they are set to invade us with greater preparation out of Peloponnesus and

the rest of Greece; and seeing with our own single power we are not able to go through; and since also the danger, in case they subdue us, would be very great to all Greece: it is necessary that we seek the succours both of you and of whomsoever else we can; and we are also to be pardoned, though we make bold to cross our former custom of not having to do with other men, proceeding not from malice, but error of judgment.

C. 433. Ol. 86. 3. 4.

“Now if you yield unto us in what we request, this coincidence on our part of need will on your part be honourable, for many reasons. First, in this respect, that you lend your help to such as have suffered, and not to such as have committed the injustice. And next, considering that you receive into league such as have at stake their whole fortune, you shall so place your benefit as to have a testimony of it, if ever any can be so, indelible. Besides this, the greatest navy but your own, is ours. Consider then, what rarer hap, and of greater grief to your enemies, can befall you, than that that power, which you would have prized above any money or other requital, should come voluntarily, and without all danger or cost present itself to your hands; bringing with it reputation amongst most men, a grateful mind from those you defend, and strength to yourselves. All which have not happened at once to many. And few there be of those that sue for league, that come not rather to receive strength and reputation, than to confer it. If any here think, that the war wherein we may do you service will not at all be, he is in an error, and seeth not how the Lacedæmonians, through fear of you, are already in labour of the war; and that the Corinthians, gracious with them and enemies to you, making way for their enterprize, assault us now in the way to the invasion of you hereafter, that we may not stand amongst the rest of their common enemies, but that they may be sure beforehand, either to weaken us, or to strengthen their own estate. It must therefore be your part,

we offering and you accepting the league, to begin with them, and to anticipate plotting rather than to counterplot against them.

C. 433. Ol. 86. 3. 4.

“If they object injustice, in that you receive their colony, henceforth let them learn that all colonies, so long as they receive no wrong from their mother city, so long they honour her; but when they suffer injury from her, they then become alienate; for they are not sent out to be the slaves of them that stay, but to be their equals. That they have done us the injury, is manifest; for when we offered them a judicial trial of the controversy touching Epidamnus, they chose to prosecute their quarrel rather by arms than judgment. Now let that which they have done unto us, who are their kindred, serve you for some argument, not to be seduced by their demands, and made their instruments before you be aware. For he lives most secure, that hath fewest benefits bestowed upon him by his enemies to repent of.

C. 433. Ol. 86. 3. 4. A. C. 433. Ol. 86. 3. 4.

“As for the articles between you and the Lacedæmonians, they are not broken by receiving us into your league, because we are in league with neither party. For there it is said, that whosoever is confederate of neither party, may have access lawfully to either. And sure it were very unreasonable, that the Corinthians should have the liberty to man their fleet out of the cities comprised in the league, and out of any other parts of Greece, and not the least out of places in your dominion; and we be denied both the league now propounded, and also all other help from whencesoever. And if they impute it to you as a fault, that you grant our request; we shall take it for a greater, that you grant it not. For therein you shall reject us that are invaded, and be none of your enemies; and them, who are your enemies and make the invasion, you shall not only not oppose, but also suffer to raise unlawful forces in your dominions. Whereas you ought in truth, either not to suffer them to take up mercenaries in your

states, or else to send us succours also, in such manner as you shall think good yourselves; but especially by taking us into your league, and so aiding us. Many commodities, as we said in the beginning, we show unto you, but this for the greatest; that whereas they are your enemies, (which is manifest enough), and not weak ones, but able to hurt those that stand up against them, we offer you a naval, not a terrestrial league; and the want of one of these is not as the want of the other. Nay rather, your principal aim, if it could be done, should be to let none at all have shipping but yourselves; or at least, if that cannot be, to make such your friends as are best furnished therewith.

C. 433. Ol. 86. 3. 4.

“If any man now think thus, that what we have spoken is indeed profitable, but fears, if it were admitted, the league were thereby broken: let that man consider, that his fear joined with strength will make his enemies fear, and his confidence, having (if he reject us) so much the less strength, will so much the less be feared. Let him also remember, that he is now in consultation no less concerning Athens than Corcyra; wherein he forecasteth none of the best, (considering the present state of affairs), that makes a question, whether against a war at hand and only not already on foot, he should join unto it or not that city, which with most important advantages or disadvantages will be friend or enemy. For it lieth so conveniently for sailing into Italy and Sicily, that it can both prohibit any fleet to come to Peloponnesus from thence, and convoy any coming from Peloponnesus thither: and is also for divers other uses most commodious. And to comprehend all in brief, consider whether we be to be abandoned or not, by this. For Greece having but three navies of any account, yours, ours, and that of Corinth, if you suffer the other two to join in one by letting the Corinthians first seize us, you shall have to fight by sea at one time both against the Corcyræans and the Peloponnesians; whereas by making league

with us, you shall, with your fleet augmented, have to deal against the Peloponnesians alone.”

Thus spake the Corcyraeans: and after them the Corinthians, thus.

oration of the ambassadors of corinth. A. C. 433. Ol. 86. 3. 4. A. C. 433. Ol. 86. 3. 4.

“The Corcyraeans in their oration having made mention not only of your taking them into league, but also that they are wronged and unjustly warred on; it is also necessary for us first to answer concerning both those points, and then afterwards to proceed to the rest of what we have to say: to the end you may foreknow that ours are the safest demands for you to embrace, and that you may upon reason reject the needy estate of those others. Whereas they allege in defence of their refusing to enter league with other cities, that the same hath proceeded from modesty, the truth is, that they took up that custom, not from any virtue, but mere wickedness; as being unwilling to have any confederate for a witness of their evil actions, and to be put to blush by calling them. Besides, their city being by the situation sufficient within itself, giveth them this point; that when they do any man a wrong, they themselves are the judges of the same, and not men appointed by consent. For going seldom forth against other nations, they intercept such as by necessity are driven into their harbour. And in this consisteth their goodly pretext for not admitting confederates, not because they would not be content to accompany others in doing evil, but because they had rather do it alone; that where they were too strong, they might oppress; and when there should be none to observe them, the less of the profit might be shared from them; and that they might escape the shame, when they took any thing. But if they had been honest men, (as they themselves say they are), by how much the less they are obnoxious to accusation, so much the more means they have, by giving and taking what is due, to make their honesty appear. 38. But they are not such, neither towards others nor towards us. For

being our colony, they have not only been ever in revolt; but now they also make war upon us, and say they were not sent out to be injured by us. But we say again, that we did not send them forth to be scorned by them, but to have the leading of them, and to be regarded by them as is fit. For our other colonies both honour and love us much: which is an argument, seeing the rest are pleased with our actions, that these have no just cause to be offended alone; and that without some manifest wrong, we should not have had colour to war against them. But say we had been in an error, it had been well done in them to have given way to our passion, as it had been also dishonourable in us to have insulted over their modesty. But through pride and wealth they have done wrong, both in many other things, and also in this; that Epidamnus being ours, which whilst it was vexed with wars they never claimed, as soon as we came to relieve it, was forcibly seized by them, and so holden.

C. 433. Ol. 86. 3. 4.

“They say now, that before they took it, they offered to put the cause to trial of judgment. But you are not to think that such a one will stand to judgment, as hath advantage and is sure already of what he offereth to plead for; but rather he, that before the trial will admit equality in the matter itself as well as in the pleading. Whereas contrarily, these men offered not this specious pretence of a judicial trial, before they had besieged the city, but after, when they saw we meant not to put it up. And now hither they be come, not content to have been faulty in that business themselves, but to get in you; into their confederacy? no; but into their conspiracy; and to receive them in this name, that they are enemies to us. But they should have come to you then, when they were most in safety; not now, when we have the wrong, and they the danger; and when you, that never partaked of their power, must impart unto them of your aid, and having been free from their faults, must have an equal share from us of the blame. They should

communicate their power before hand, that mean to make common the issue of the same; and they that share not in the crimes, ought also to have no part in the sequel of them.

C. 433. Ol. 86. 3. 4. A. C. 440. Ol. 85. 1.

“Thus it appears, that we come for our parts with arguments of equity and right; whereas the proceedings of these other are nothing else but violence and rapine. And now we shall show you likewise, that you cannot receive them in point of justice. For although it be in the articles, that the cities written with neither of the parties may come in to whether of them they please; yet it holds not for such as do so to the detriment of either; but only for those, that having revolted from neither part, want protection, and bring not a war with them instead of peace to those (if they be wise) that receive them. For you shall not only be auxiliaries unto these; but to us, instead of confederates, enemies. For if you go with them, it follows, they must defend themselves not without you. You should do most uprightly, to stand out of both our ways; and if not that, then to take our parts against the Corcyræans; (for between the Corinthians and you there are articles of peace, but with the Corcyræans you never had so much as a truce); and not to constitute a new law, of receiving one another’s rebels. For neither did we give our votes against you, when the Samians revolted, though the rest of Peloponnesus was divided in opinion; but plainly alleged, that it was reason, that every one should have liberty to proceed against their own revolting confederates. And if you shall once receive and aid the doers of wrong, it will be seen that they will come over as fast from you to us; and you shall set up a law, not so much against us, as against yourselves.

C. 433. Ol. 86. 3. 4. A. C. 491. Ol. 72. 2.

“These are the points of justice we had to show you, conformable to the law of the Grecians. And now we come to matter of advice, and claim of favour; which (being not so much your enemies as to hurt you, nor such

friends as to surcharge you) we say, ought in the present occasion to be granted us by way of requital. For when you had want of long barks against the Æginetæ, a little before the Medan war, you had twenty lent unto you by the Corinthians; which benefit of ours, and that other against the Samians, when by us it was that the Peloponnesians did not aid them, was the cause both of your victory against the Æginetæ, and of the punishment of the Samians. And these things were done for you in a season, when men, going to fight against their enemies, neglect all respects but of victory. For even a man's domestic affairs are ordered the worse, through eagerness of present contention.

C. 433. Ol.86.3.4.

“Which benefits considering, and the younger sort taking notice of them from the elder, be you pleased to defend us now in the like manner. And have not this thought: that though in what we have spoken there be equity, yet, if the war should arise, the profit would be found in the contrary. For utility followeth those actions most, wherein we do the least wrong; besides that the likelihood of the war, wherewith the Corcyræans frightening you go about to draw you to injustice, is yet obscure, and not worthy to move you to a manifest and present hostility with the Corinthians; but it were rather fit for you, indeed, to take away our former jealousies concerning the Megareans. For the last good turn done in season, though but small, is able to cancel an accusation of much greater moment. Neither suffer yourselves to be drawn on by the greatness of the navy which now shall be at your service by this league. For to do no injury to our equals, is a firmer power, than that addition of strength, which, puffed up with present shows, men are to acquire with danger.

“And since we be come to this, which once before we said at Lacedæmon, that every one ought to proceed as he shall think good against his own confederates, we claim that liberty now of you; and that you that

have been helped by our votes, will not hurt us now by yours, but render like for like; remembering, that now is that occasion, wherein he that aideth us is our greatest friend, and he that opposeth us our greatest enemy: and that you will not receive these Corcyræans into league against our wills, nor defend them in their injuries. These things if you grant us, you shall both do as is fit, and also advise the best for the good of your own affairs.”

This was the effect of what was spoken by the Corinthians.

C. 433. Ol.86.3.4. A league defensive made between the Athenians and Corcyræans.

Both sides having been heard, and the Athenian people twice assembled; in the former assembly they approved no less of the reasons of the Corinthians than of the Corcyræans. But in the latter they changed their minds; not so as to make a league with the Corcyræans both offensive and defensive, that the friends and enemies of the one should be so of the other; (for then, if the Corcyræans should have required them to go against Corinth, the peace had been broken with the Peloponnesians); but made it only defensive, that if any one should invade Corcyræ or Athens, or any of their confederates, they were then mutually to assist one another. For they expected that even thus they should grow to war with the Peloponnesians, and were therefore unwilling to let Corcyræ, that had so great a navy, to fall into the hands of the Corinthians; but rather, as much as in them lay, desired to break them one against another; that if need required, they might have to do with the Corinthians, and others that had shipping, when they should be weakened to their hands. And the island seemed also to lie conveniently for passing into Italy and Sicily.

They aid Corcyræ with ten galleys. A. C. 432. Ol. 87. 1.

With this mind the people of Athens received the Corcyræans into league; and when the Corinthians were gone, sent ten galleys not long after to their aid. The commanders of them were Lacedæmonius the son of

Cimon, Diotimus the son of Strombichus, and Proteas the son of Epicles; and had order not to fight with the Corinthians, unless they invaded Corcyra, or offered to land there or in some other place of theirs: which, if they did, then with all their might to oppose them. This they forbad, because they would not break the peace concluded with the Peloponnesians. So these galleys arrived at Corcyra.

The Corinthian fleet. A. C. 432. Ol. 87. 1.

The Corinthians, when they were ready, made towards Corcyra with one hundred and fifty sail; of the Eleans ten, of the Megareans twelve, of the Leucadians ten, of the Ambraciots twenty-seven, of the Anactorians one, and ninety of their own. The commanders of these were men chosen out of the said several cities, for the several parts of the fleet which they sent in; and over those of Corinth was Xenocleides the son of Euthicles, with four others. After they were all come together upon the coast of the continent over against Corcyra, they sailed from Leucas, and came to Chimerium in the country of Thesprotis. In this place is a haven, and above it, farther from the sea, the city of Ephyra, in that part of Thesprotis which is called Elæatis; and near unto it disbogueth into the sea the lake Acherusia, and into that (having first passed through Thesprotis) the river Acheron, from which it taketh the name. Also the river Thyamis runneth here, which divideth Thesprotis from Cestrine; betwixt which two rivers ariseth this promontory of Chimerium. To this part of the continent came the Corinthians, and encamped.

The Corcyraean fleet.

The Corcyraeans understanding that they made against them, having ready one hundred and ten galleys under the conduct of Miciades, Æsimides, and Eurybatus, came and encamped in one of the islands called Sybota: and the ten galleys of Athens were also with them. But their land forces stayed in the promontory of Leucimna, and with them one thousand

men of arms of the Zacynthians that came to aid them. The Corinthians also had in the continent the aids of many barbarians, which in those quarters have been evermore their friends.

The Corinthians set forward. A. C. 432. Ol. 87. 1.

The Corinthians, after they were ready and had taken aboard three days' provision of victual, put off by night from Chimerium with purpose to fight; and about break of day, as they were sailing, descried the galleys of the Corcyræans, which were also put off from Sybota and coming on to fight with the Corinthians. As soon as they had sight one of another, they put themselves into order of battle. In the right wing of the Corcyræans were placed the galleys of Athens; and the rest being their own, were divided into three commands, under the three commanders, one under one. This was the order of the Corcyræans. The Corinthians had in their right wing the galleys of Megara and of Ambracia; in the middle, other their confederates in order; and opposite to the Athenians and right wing of the Corcyræans they were themselves placed, with such galleys as were best of sail, in the left.

The battle. A. C. 432. Ol. 87. 1. The Corinthians have the better. The Athenians and Corinthians fight. A. C. 432. Ol. 87. 1.

The standard being on either side lift up, they joined battle; having on both parts both many men of arms and many archers and slingers, but after the old fashion as yet somewhat unskilfully appointed. The battle was not so artificially as cruelly fought; near unto the manner of a fight at land. For after they had once run their galleys up close aboard one of another, they could not for the number and throng be easily gotten asunder again, but relied for the victory especially upon their men of arms, who fought where they stood whilst the galleys remained altogether without motion. Passages through each other they made none, but fought it out with courage and strength, rather than with skill. Insomuch as the battle was in every part not without much tumult and disorder: in which the Athenian galleys, being

always, where the Corcyræans were oppressed, at hand, kept the enemies in fear, but yet began no assault, because their commanders stood in awe of the prohibition of the Athenian people. The right wing of the Corinthians was in the greatest distress; for the Corcyræans with twenty galleys had made them turn their backs, and chased them dispersed to the continent; and sailing to their very camp, went aland, burnt their abandoned tents and took away their baggage. So that in this part the Corinthians and their confederates were vanquished, and the Corcyræans had the victory. But in the left wing, where the Corinthians were themselves, they were far superior; because the Corcyræans had twenty galleys of their number, which was at first less than that of the Corinthians, absent in the chase of the enemy. And the Athenians, when they saw the Corcyræans were in distress, now aided them manifestly; whereas before, they had abstained from making assault upon any. But when once they fled outright, and that the Corinthians lay sore upon them, then every one fell to the business without making difference any longer: and it came at last to this necessity, that they undertook one another, Corinthians and Athenians.

Sybota of the continent, a haven. A. C. 432. Ol. 87. 1. A supply of twenty sail from Athens.

The Corinthians, when their enemies fled, staid not to fasten the hulls of the galleys they had sunk unto their own galleys, that so they might tow them after; but made after the men, rowing up and down, to kill rather than to take alive; and through ignorance (not knowing that their right wing had been discomfited) slew also some of their own friends. For the galleys of either side being many and taking up a large space at sea, after they were once in the medley they could not easily discern who were of the victors, and who of the vanquished party. For this was the greatest naval battle, for number of ships, that ever had been before of Grecians against Grecians. When the Corinthians had chased the Corcyræans to the shore, they

returned to take up the broken galleys and bodies of their dead; which for the greatest part they recovered and brought to Sybota, where also lay the land-forces of the barbarians that were come to aid them. This Sybota is a desert haven of Thesprotis. When they had done, they reunited themselves, and made again to the Corcyraeans. And they likewise, with such galleys as they had fit for the sea remaining of the former battle, together with those of Athens, put forth to meet them, fearing lest they should attempt to land upon their territory. By this time the day was far spent, and the song which they used to sing when they came to charge, was ended, when suddenly the Corinthians began to row astern: for they had descried twenty Athenian galleys, sent from Athens to second the former ten; for fear lest the Corcyraeans (as it also fell out) should be overcome, and those ten galleys of theirs be too few to defend them.

The Corinthians fall off. A. C. 432. Ol. 87. 1.

When the Corinthians therefore had sight of these galleys, suspecting that they were of Athens and more in number than they were, by little and little they fell off. But the Corcyraeans (because the course of these galleys was unto them more out of sight) descried them not, but wondered why the Corinthians rowed astern; till at last some that saw them, said they were enemies; and then retired also the Corcyraeans. For by this time it was dark, and the Corinthians had turned about the heads of their galleys and dissolved themselves. And thus were they parted, and the battle ended in night. The Corcyraeans lying at Leucimna, these twenty Athenian galleys, under the command of Glaucon the son of Leagrus, and Andocides the son of Leogorus, passing through the midst of the floating carcasses and wrecks, soon after they were descried arrived at the camp of the Corcyraeans in Leucimna. The Corcyraeans at first (being night) were afraid they had been enemies, but knew them afterwards; so they anchored there.

The Corcyraeans offer battle again. A. C. 432. Ol. 87. 1. The Corinthians expostulate with the Athenians, to sound their purpose. The answer of the Athenians.

The next day, both the thirty galleys of Athens and as many of Corcyra as were fit for service, went to the haven in Sybota, where the Corinthians lay at anchor, to see if they would fight. But the Corinthians, when they had put off from the land and arranged themselves in the wide sea, stood quiet, not meaning of their own accord to begin the battle; both for that they saw the supply of fresh galleys from Athens, and for many difficulties that happened to them, both about the safe custody of their prisoners aboard, and also for that being in a desert place their galleys were not yet repaired; but took thought rather how to go home, for fear lest the Athenians, having the peace for already broken in that they had fought against each other, should not suffer them to depart. 53. They therefore thought good to send afore unto the Athenians certain men without privilege of heralds, for to sound them, and to say in this manner: "Men of Athens, you do unjustly to begin the war and violate the articles: for whereas we go about to right us on our enemies, you stand in our way and bear arms against us: if therefore you be resolved to hinder our going against Corcyra or whatsoever place else we please, dissolve the peace, and laying hands first upon us that are here, use us as enemies." Thus said they: and the Corcyraeans, as many of the army as heard them, cried out immediately to take and kill them. But the Athenians made answer thus: "Men of Peloponnesus, neither do we begin the war nor break the peace; but we bring aid to these our confederates, the Corcyraeans: if you please therefore to go any whither else, we hinder you not; but if against Corcyra, or any place belonging unto it, we will not suffer you."

The Corinthians go home. Both the Corcyraeans and Corinthians challenge the victory, and both set up trophies. A. C. 432. Ol. 87. 1.

54. When the Athenians had given them this answer, the Corinthians made ready to go home, and set up a trophy in Sybota of the continent. And the Corcyræans also both took up the wreck and bodies of the dead, which carried every way by the waves and the winds that arose the night before, came driving to their hands; and, as if they had had the victory, set up a trophy likewise in Sybota the island. The victory was thus challenged on both sides upon these grounds. The Corinthians did set up a trophy, because in the battle they had the better all day, having gotten more of the wreck and dead bodies than the other, and taken no less than a thousand prisoners, and sunk about seventy of the enemies' galleys. And the Corcyræans set up a trophy, because they had sunk thirty galleys of the Corinthians, and had, after the arrival of the Athenians, recovered the wreck and dead bodies that drove to them by reason of the wind; and because the day before, upon sight of the Athenians, the Corinthians had rowed astern and went away from them: and lastly, for that when they went to Sybota, the Corinthians came not out to encounter them. Thus each side claimed victory.

The Corinthians in their way home, take Anactorium, and keep two hundred and fifty of the best men prisoners, being Corcyræans, and use them well. A. C. 432. Ol. 87. 1.

55. The Corinthians in their way homeward took in Anactorium, a town seated in the mouth of the Gulf of Ambracia, by deceit; (this town was common to them and to the Corcyræans); and having put into it Corinthians only, departed and went home. Of the Corcyræans, eight hundred that were servants, they sold; and kept prisoners two hundred and fifty, whom they used with very much favour, that they might be a means, at their return, to bring Corcyra into the power of the Corinthians; the greatest part of these being principal men of the city. And thus was Corcyra delivered of the war of Corinth, and the Athenian galleys went from them. This was the first cause that the Corinthians had of war against the Athenians: namely,

because they had taken part with the Corcyræans in a battle by sea against the Corinthians, with whom they were comprised in the same articles of peace.

The second pretext of the war: Potidæa suspected. Potidæa commanded to give hostages, and to pull down part of their wall. A. C. 432. Ol. 87. 2.

56. Presently after this, it came to pass that other differences arose between the Peloponnesians and the Athenians, to induce the war. For whilst the Corinthians studied to be revenged, the Athenians, who had their hatred in jealousy, commanded the citizens of Potidæa, a city seated in the Isthmus of Pallene, a colony of the Corinthians, but confederate and tributary to the Athenians, to pull down that part of the wall of their city that stood towards Pallene, and to give them hostages, and also to send away and no more receive the *Epidemiurgi*, (magistrates so called), which were sent unto them year by year from Corinth; fearing lest through the persuasion of Perdiccas and of the Corinthians they should revolt, and draw to revolt with them their other confederates in Thrace.

The Athenians give orders to the generals they were sending against Perdiccas, to secure their cities in those parts. A. C. 432. Ol. 87. 1.

57. These things against the Potidæans, the Athenians had precontrived presently after the naval battle fought at Corcyra. For the Corinthians and they were now manifestly at difference; and Perdiccas, who before had been their confederate and friend, now warred upon them. And the cause why he did so was, that when his brother Philip and Derdas joined in arms against him, the Athenians had made a league with them. And therefore being afraid, he both sent to Lacedæmon to negotiate the Peloponnesian war, and also reconciled himself to the Corinthians the better to procure the revolt of Potidæa. And likewise he practised with the Chalcideans of Thrace, and with the Bottiæans, to revolt with them: for if he could make these confining cities his confederates, with the help of them he thought his war

would be the easier. Which the Athenians perceiving, and intending to prevent the revolt of these cities, gave order to the commanders of the fleet, (for they were now sending thirty galleys with a thousand men of arms, under the command of Archestratus the son of Lycomedes, and ten others, into the territories of Perdiccas), both to receive hostages of the Potidæans, and to demolish their walls; and also to have an eye to the neighbouring cities, that they revolted not.

The Potidæans seek the protection of the Lacedæmonians. The revolt of Potidæa, Bottiæa, and Chalcidice, from the Athenians. A. C. 432. Ol. 87. 1.

58. The Potidæans having sent ambassadors to Athens, to try if they could persuade the people not to make any alteration amongst them; by other ambassadors, whom they sent along with the ambassadors of Corinth to Lacedæmon, dealt with the Lacedæmonians at the same time, if need required, to be ready to revenge their quarrel. When after long solicitation at Athens and no good done, the fleet was sent away against them no less than against Macedonia: and when the magistrates of Lacedæmon had promised them, if the Athenians went to Potidæa, to invade Attica: then at last they revolted, and together with them the Chalcideans and Bottiæans, all mutually sworn in the same conspiracy. For Perdiccas had also persuaded the Chalcideans to abandon and pull down their maritime towns, and to go up and dwell at Olynthus, and that one city to make strong: and unto those that removed, gave part of his own, and part of the territory of Mygdonia, about the lake Bolbe, to live on, so long as the war against the Athenians should continue. So when they had demolished their cities, and were gone up higher into the country, they prepared themselves to the war.

The Athenian fleet, finding Potidæa and other cities already lost, go into Macedonia.

59. The Athenian galleys, when they arrived in Thrace, found Potidæa and the other cities already revolted. And the commanders of the fleet

conceiving it to be impossible, with their present forces, to make war both against Perdiccas and the towns revolted, set sail again for Macedonia, against which they had been at first sent out; and there staying, joined with Philip and the brothers of Derdas, that had invaded the country from above.

The Corinthians send their forces to Potidæa to defend it.

60. In the meantime after Potidæa was revolted, and whilst the Athenian fleet lay on the coast of Macedonia, the Corinthians, fearing what might become of the city, and making the danger their own, sent unto it, both of their own city, and of other Peloponnesians which they hired, to the number of sixteen hundred men of arms and four hundred light armed. The charge of these was given to Aristeus the son of Adimantus, for whose sake most of the volunteers of Corinth went the voyage: for he had been ever a great favourer of the Potidæans. And they arrived in Thrace after the revolt of Potidæa forty days.

C. 432. Ol. 87. 1. The Athenians send forces against Potidæa. Veria.

61. The news of the revolt of these cities was likewise quickly brought to the Athenian people; who hearing withal of the forces sent unto them under Aristeus, sent forth against the places revolted two thousand men of arms and forty galleys, under the conduct of Callias the son of Calliades. These coming first into Macedonia, found there the former thousand, who by this time had taken Therme, and were now besieging the city of Pydna; and staying, helped for a while to besiege it with the rest. But shortly after they took composition; and having made a necessary league with Perdiccas, (urged thereto by the affairs of Potidæa, and the arrival there of Aristeus), departed from Macedonia. Thence coming to Berrhœa, they attempted to take it: but when they could not do it, they turned back, and marched towards Potidæa by land. They were of their own number three thousand men of arms, besides many of their confederates; and of Macedonians that had served with Philip and Pausanias, six hundred horsemen. And their

galleys, seventy in number, sailing by them along the coast, by moderate journeys came in three days to Gigonus, and there encamped.

C. 432. Ol. 87. 1. The Athenians and those with Aristeus prepare themselves for battle. A. C. 432. Ol. 87. 1. The victory falleth to the Athenians. A. C. 432. Ol. 87. 1.

62. The Potidæans and the Peloponnesians under Aristeus, in expectation of the coming of the Athenians, lay now encamped in the isthmus near unto Olynthus, and had the market kept for them without the city. And the leading of the foot the confederates had assigned to Aristeus, and of the horse to Perdiccas: for he fell off again presently from the Athenians, and having left Iolaus governor in his place, took part with the Potidæans. The purpose of Aristeus was, to have the body of the army with himself within the isthmus, and therewith to attend the coming on of the Athenians; and to have the Chalcideans and their confederates without the isthmus, and also the two hundred horse under Perdiccas, to stay in Olynthus, and when the Athenians were passed by, to come on their backs and to inclose the enemy betwixt them. But Callias the Athenian general, and the rest that were in commission with him, sent out before them their Macedonian horsemen and some few of their confederates to Olynthus, to stop those within from making any sally from the town; and then dislodging marched on towards Potidæa. When they were come on as far as the isthmus, and saw the enemy make ready to fight, they also did the like; and not long after they joined battle. That wing wherein was Aristeus himself, with the chosen men of the Corinthians and others, put to flight that part of their enemies that stood opposite unto them, and followed execution a great way. But the rest of the army of the Potidæans and Peloponnesians were by the Athenians defeated, and fled into the city. 63. And Aristeus, when he came back from the execution, was in doubt what way to take, to Olynthus or to Potidæa. In the end he resolved of the shortest way, and with his soldiers about him ran as

hard as he was able into Potidæa; and with much ado got in at the pier through the sea, cruelly shot at, and with the loss of a few, but the safety of the greatest part of his company. As soon as the battle began, they that should have seconded the Potidæans from Olynthus, (for it is at most but sixty furlongs off, and in sight), advanced a little way to have aided them; and the Macedonian horse opposed themselves likewise in order of battle, to keep them back. But the Athenians having quickly gotten the victory, and the standards being taken down, they retired again; they of Olynthus into that city, and the Macedonian horsemen into the army of the Athenians. So that neither side had their cavalry at the battle. After the battle the Athenians erected a trophy, and gave truce to the Potidæans for the taking up of the bodies of their dead. Of the Potidæans and their friends there died somewhat less than three hundred; and of the Athenians themselves one hundred and fifty, with Callias one of their commanders.

The Athenians begin to besiege Potidæa. The Athenians send Phormio with sixteen hundred men of arms to Potidæa. A. C. 432. Ol. 87. 1. Potidæa straightly besieged on all sides.

64. Presently upon this, the Athenians raised a wall before the city on the part towards the isthmus, which they kept with a garrison; but the part to Pallene—ward they left unwallled. For they thought themselves too small a number, both to keep a guard in the isthmus, and withal to go over and fortify in Pallene; fearing lest the Potidæans and their confederates should assault them when divided. When the people of Athens understood that Potidæa was unwallled on the part toward Pallene, not long after they sent thither sixteen hundred men of arms under the conduct of Phormio the son of Asopius: who arriving in Pallene, left his galleys at Aphytis, and marching easily to Potidæa wasted the territory as he passed through. And when none came out to give him battle, he raised a wall before the city on that part also that looketh towards Pallene. Thus was Potidæa on both sides

strongly besieged; and also from the sea by the Athenian galleys, that came up and rode before it.

The advice of Aristeus, to carry all the people but five hundred men out of the city, that their victual might the better hold out, refused. Aristeus getteth out of the city, unseen of the Athenians. And staying in Chalcidice, slew certain of the city of Sermylus by ambushment. Phormio wasteth the territories of the Chalcideans and Bottiæans.

65. Aristeus, seeing the city enclosed on every side, and without hope of safety save what might come from Peloponnesus or some other unexpected way, gave advice to all but five hundred, taking the opportunity of a wind, to go out by sea, that the provision might the longer hold out for the rest; and of them that should remain within offered himself to be one. But when his counsel took not place, being desirous to settle their business, and make the best of their affairs abroad, he got out by sea unseen of the Athenian guard; and staying amongst the Chalcideans, amongst other actions of the war, laid an ambush before Sermylus and slew many of that city, and solicited the sending of aid from Peloponnesus. And Phormio, after the siege laid to Potidæa, having with him his sixteen hundred men of arms, wasted the territory of the Chalcideans and Bottiæans, and some small towns he took in.

C. 432. Ol. 87. 1. The solicitation of the war by the Corinthians and other confederates of the Lacedæmonians. Complaints exhibited against the Athenians in the council of Sparta. A. C. 432. Ol. 87. 1.

66. These were the quarrels between the Peloponnesians and the Athenians. The Corinthians quarrelled the Athenians, for besieging Potidæa, and in it the men of Corinth and Peloponnesus. The Athenians quarrelled the Peloponnesians, for causing their confederate and tributary city to revolt; and for that they had come thither, and openly fought against them in the behalf of Potidæa. Nevertheless the war brake not openly forth

as yet, and they yet abstained from arms; for this was but a particular action of the Corinthians. 67. But when Potidæa was once besieged, both for their men's sakes that were within, and also for fear to lose the place, they could no longer hold. But out of hand, they procured of their confederates to go to Lacedæmon; and thither also they went themselves with clamours and accusations against the Athenians, that they had broken the league and wronged the Peloponnesians. The Æginetæ, though not openly by ambassadors for fear of the Athenians, yet privily instigated them to the war as much as any; alledging that they were not permitted to govern themselves according to their own laws, as by the articles they ought to have been. So the Lacedæmonians having called together the confederates, and whosoever else had any injustice to lay to the charge of the Athenians, in the ordinary council of their own state commanded them to speak. Then presented every one his accusation; and amongst the rest the Megareans, besides many other their great differences, laid open this especially, that contrary to the articles they were forbidden the Athenian markets and havens. Last of all, the Corinthians, when they had suffered the Lacedæmonians to be incensed first by the rest, came in and said as followeth.

oration of the ambassadors of corinth. A. C. 432. Ol 87. 1.

68. "Men of Lacedæmon, your own fidelity, both in matter of estate and conversation, maketh you the less apt to believe us, when we accuse others of the contrary. And hereby you gain indeed a reputation of equity, but you have less experience in the affairs of foreign states. For although we have oftentimes foretold you, that the Athenians would do us a mischief; yet from time to time when we told it you, you never would take information of it; but have suspected rather, that what we spake hath proceeded from our own private differences. And you have therefore called hither these confederates, not before we had suffered, but now when the evil is already

upon us. Before whom our speech must be so much the longer, by how much our objections are the greater, in that we have both by the Athenians been injured, and by you neglected. If the Athenians lurking in some obscure place, had done these wrongs unto the Grecians, we should then have needed to prove the same before you as to men that knew it not. But now what cause have we to use long discourse, when you see already that some are brought into servitude, and that they are contriving the like against others, and especially against our confederates; and are themselves, in case war should be made against them, long since prepared for it? For else they would never have taken Corcyra, and holden it from us by force, nor have besieged Potidæa; whereof the one was most commodious for any action against Thrace, and the other had brought unto the Peloponnesians a most fair navy.

C. 432. Ol. 87. 1. A. C. 432. Ol. 87. 1.

69. “And of all this you are yourselves the authors, in that you suffered them upon the end of the Persian war to fortify their city, and again afterwards to raise their long walls; whereby you have hitherto deprived of their liberty, not only the states by them already subdued, but also your own confederates. For not he that bringeth into slavery, but he that being able to hinder it neglects the same, is most truly said to do it; especially if they assume the honour to be esteemed the deliverers of Greece [as you do]. And for all that, we are hardly yet come together, and indeed not yet with any certain resolution what to do. For the question should not have been put, whether or not we have received injury, but rather in what manner we are to repair it. For they that do the wrong, having consulted upon it beforehand, use no delay at all, but come upon them whom they mean to oppress, whilst they be yet irresolute. And we know, not only that the Athenians have incroached upon their neighbours, but also by what ways they have done it. And as long as they think they carry it closely through your blindness, they

are the less bold: but when they shall perceive that you see, and will not see, they will then press us strongly indeed. For, Lacedæmonians, you are the only men of all Greece, that sitting still defend others, not with your forces, but with promises; and you are also the only men, that love to pull down the power of the enemy, not when it beginneth, but when it is doubled. You have indeed a report to be sure; but yet it is more in fame that, than in fact. For we ourselves know, that the Persian came against Peloponnesus from the utmost parts of the earth, before you encountered him as became your state. And also now you connive at the Athenians, who are not as the Medes, far off, but hard at hand; choosing rather to defend yourselves from their invasion, than to invade them; and by having to do with them when their strength is greater, to put yourselves upon the chance of fortune. And yet we know that the barbarian's own error, and in our war against the Athenians, their own oversights, more than your assistance, was the thing that gave us victory. For the hope of your aid hath been the destruction of some, that relying on you, made no preparation for themselves by other means. Yet let not any man think that we speak this out of malice, but only by way of expostulation: for expostulation is with friends that err, but accusation against enemies that have done an injury.

C. 432. Ol. 87. 1. A. C. 432. Ol. 87. 1. A. C. 432. Ol. 87. 1.

70. "Besides, if there be any that may challenge to exprobate his neighbour, we think ourselves may best do it; especially on so great quarrels as these, whereof you neither seem to have any feeling, nor to consider what manner of men, and how different from you in every kind the Athenians be, that you are to contend withal. For they love innovation, and are swift to devise, and also to execute what they resolve on. But you on the contrary are only apt to save your own; not devise any thing new, nor scarce to attain what is necessary. They again are bold beyond their strength, adventurous above their own reason, and in danger hope still the best.

Whereas your actions are ever beneath your power, and you distrust even what your judgment assures; and being in a danger, never think to be delivered. They are stirrers, you studiers; they love to be abroad, and you at home the most of any. For they make account by being abroad to add to their estate; you, if you should go forth against the state of another, would think to impair your own. They, when they overcome their enemies advance the farthest, and when they are overcome by their enemies, fall off the least; and as for their bodies, they use them in the service of the commonwealth as if they were none of their own; but their minds, when they would serve the state, are right their own. Unless they take in hand what they have once advised on, they account so much lost of their own. And when they take it in hand, if they obtain any thing, they think lightly of it in respect of what they look to win by their prosecution. If they fail in any attempt, they do what is necessary for the present, and enter presently into other hopes. For they alone both have and hope for at once whatsoever they conceive, through their celerity in execution of what they once resolve on. And in this manner they labour and toil all the days of their lives. What they have, they have no leisure to enjoy, for continual getting of more: nor holiday esteem they any, but whereon they effect some matter profitable; nor think they ease with nothing to do, a less torment than laborious business. So that, in a word, to say they are men born neither to rest themselves, nor suffer others, is to say the truth. 71. Now notwithstanding, men of Lacedæmon, that this city, your adversary, be such as we have said, yet you still delay time; not knowing, that those only are they to whom it may suffice for the most part of their time to sit still, who, though they use not their power to do injustice, yet bewray a mind unlikely to swallow injuries; but placing equity belike in this, that you neither do any harm to others, nor receive it in defending of yourselves. But this is a thing you hardly could attain, though the states about you were of the same condition. But, as we have before declared,

your customs are in respect of theirs antiquated; and of necessity, as it happeneth in arts, the new ones will prevail. True it is, that for a city living for the most part in peace, unchanged customs are the best; but for such as be constrained to undergo many matters, many devices will be needful. Which is also the reason why the Athenian customs, through much experience, are more new to you than yours are to them. Here therefore give a period to your slackness; and by a speedy invasion of Attica, as you promised, relieve both Potidæa and the rest: lest otherwise you betray your friends and kindred to their cruellest enemies; and lest we and others be driven through despair to seek out some other league. Which to do were no injustice, neither against the Gods, judges of men's oaths, nor against men, the hearers of them. For not they break the league, who being abandoned have recourse to others; but they that yield not their assistance to whom they have sworn it. But if you mean to follow the business seriously, we will stay; for else we should do irreligiously, neither should we find any other more conformable to our manners, than yourselves. Therefore deliberate well of these points; and take such a course, that Peloponnesus may not by your leading fall into worse estate, than it was left unto you by your progenitors."

The Athenian ambassadors residing in Lacedæmon upon their business, desire to make answer to the oration of the Corinthians. A. C. 432. Ol. 87. 1.

72. Thus spake the Corinthians. The Athenian ambassadors, who chanced to be residing at Lacedæmon upon their business, when they heard of this oration, thought fit to present themselves before the Lacedæmonians, not to make apology for what they were charged with by the other cities, but to show in general, that it was not fit for them in this case to take any sudden resolution, but farther time to consider. Also they desired to lay open the power of their city; to the elder sort, for a remembrance of what

they knew already, and to the younger, for an information of what they knew not: supposing, that when they should have spoken, they would incline to quietness rather than to war. And therefore they presented themselves before the Lacedæmonians, saying, that they also, if they might have leave, desired to speak in the assembly; who willed them to come in. And the Athenians went into the assembly and spake to this effect.

oration of the ambassadors of athens. A. C. 432. Ol. 87. 1.

73. “Though our embassy was not to this end, that we should argue against our confederates, but about such other affairs as the city was pleased to employ us in; yet having heard of the great exclamation against us, we came into the court, not to make answer to the criminations of the cities, (for to plead before you here, were not to plead before the judges either of them or us), but to the end you may not be drawn away to take the worse resolution at the persuasion of the confederates, in matters of so great importance: and withal, touching the sum of the oration made against us, to inform you that what we possess, we have it justly, and that our city deserveth reputation. But what need we now to speak of matters long past, confirmed more by hearsay, than by the eyes of those that are to hear us relate them? But our actions against the Persian, and such as you yourselves know as well as we, those, though it be tedious to hear them ever objected, we must of necessity recite. For when we did them, we hazarded ourselves for some benefit, of which, as you had your parts in the substance, so must we have ours (if that be any benefit) in the commemoration. And we shall make recital of them, not by way of deprecation, but of protestation and declaration of what a city, in case you take ill advice, you have to enter the list withal. We therefore say, that we not only first and alone hazarded battle against the barbarian in the fields of Marathon, but also afterwards, when he came again, being unable to resist him by land, embarked ourselves, every man that was able to bear arms, and gave him battle amongst the rest by sea

at Salamis; which was the cause that kept him back from sailing to Peloponnesus, and laying it waste city after city: for against so many galleys you were not able to give each other mutual succour. And the greatest proof of this is the Persian himself; who when his fleet was overcome, and that he had no more such forces, went away in haste with the greatest part of his army.

C. 432. Ol. 87. 1. A. C. 432. Ol. 87. 1.

74. “Which being so, and evident that the whole state of the Grecians was embarked in their fleet, we conferred to the same the three things of most advantage; namely, the greatest number of galleys, the most prudent commander, and the most lively courage. For of four hundred galleys in the whole, our own were few less than two-thirds; and for commander Themistocles, who was the principal cause that the battle was fought in the strait, whereby he clearly saved the whole business, and whom, though a stranger, you your selves have honoured for it more than any man that came unto you. And a forwardness we showed more adventurous than any other, in this, that when none of them had aided us by land before, and the rest of the cities, as far as to our own, were brought into servitude, we were nevertheless content both to quit our city and lose our goods; and even in that estate, not to betray the common cause of the confederates, or divided from them to be unuseful, but to put ourselves into our navy and undergo the danger with them; and that without passion against you for not having formerly defended us in the like manner. So that we may say, that we have no less conferred a benefit upon you, than we received it from you. You came indeed to aid us, but it was from cities inhabited, and to the end you might still keep them so; and when you were afraid, not of our danger, but your own. Whereas we, coming from a city no more being, and putting ourselves into danger for a city hopeless ever to be again, saved both you in part, and ourselves. But if we had joined with the Persian, fearing (as others

did) to have our territories wasted; or afterwards, as men lost, durst not have put ourselves into our galleys, you must not have fought with him by sea, because your fleet had been too small; but his affairs had succeeded as he would himself.

C. 432. Ol. 87. 1. Oration of the Athenians. A. C. 432. Ol. 87. 1. Oration of the Athenians. A. C. 432. Ol. 87. 1. Oration of the Athenians. A. C. 432. Ol. 87. 1. Oration of the Athenians.

75. "Therefore, men of Lacedæmon, we deserve not so great envy of the Grecians, for our courage at that time and for our prudence, and for the dominion we hold, as we now undergo. Which dominion we obtained not by violence, but because the confederates, when yourselves would not stay out the relics of the war against the barbarian, came in and entreated us to take the command of their own accord. So that at first we were forced to advance our dominion to what it is, out of the nature of the thing itself; as chiefly for fear, next for honour, and lastly for profit. For when we had the envy of many, and had reconquered some that had already revolted, and seeing you were no more our friends as you had been, but suspected and quarrelled us, we held it no longer a safe course, laying by our power to put ourselves into your danger. For the revolts from us, would all have been made to you. Now it is no fault for men in danger, to order their affairs to the best. 76. For you also, men of Lacedæmon, have command over the cities of Peloponnesus, and order them to your best advantage. And had you, when the time was, by staying it out, been envied in your command, as we know well, you would have been no less heavy to the confederates than we, you must have been constrained to rule imperiously, or to have fallen into danger. So that, though overcome by three the greatest things, honour, fear, and profit, we have both accepted the dominion delivered us and refuse again to surrender it, we have therein done nothing to be wondered at nor beside the manner of men. Nor have we been the first in this kind, but it

hath been ever a thing fixed, for the weaker to be kept under by the stronger. Besides, we took the government upon us as esteeming ourselves worthy of the same; and of you also so esteemed, till having computed the commodity, you now fall to allegation of equity; a thing which no man that had the occasion to achieve anything by strength, ever so far preferred as to divert him from his profit. Those men are worthy of commendation, who following the natural inclination of man in desiring rule over others, are juster than for their own power they need. And therefore if another had our power, we think it would best make appear our own moderation; and yet our moderation hath undeservedly incurred contempt rather than commendation. 77. For though in pleas of covenants with our confederates, when in our own city we have allowed them trial by laws equal both to them and us, the judgment hath been given against us, we have then nevertheless been reputed contentious. None of them considering that others, who in other places have dominion and are toward their subject states less moderate than we, yet are never upbraided for it. For they that have the power to compel, need not at all to go to law. And yet these men having been used to converse with us upon equal terms, if they lose anything which they think they should not, either by sentence or by the power of our government, they are not thankful for the much they retain, but take in worse part the little they forego, than if at first, laying law aside, we had openly taken their goods by violence. For in this kind also they themselves cannot deny, but the weaker must give way to the stronger. And men, it seems, are more passionate for injustice, than for violence. For that, coming as from an equal, seemeth rapine; and the other, because from one stronger, but necessity. Therefore when they suffered worse things under the Medes' dominion, they bore it; but think ours to be rigorous. And good reason; for to men in subjection, the present is ever the worst estate. Insomuch as you also, if you should put us down and reign yourselves, you

would soon find a change of the love which they bear you now for fear of us, if you should do again as you did for a while, when you were their commanders against the Medes. For not only your own institutions are different from those of others, but also when any one of you comes abroad [with charge], he neither useth those of yours, nor yet those of the rest of Greece. 78. Deliberate therefore of this a great while, as of a matter of great importance; and do not upon the opinions and criminations of others procure your own trouble. Consider before you enter, how unexpected the chances of war be. For a long war for the most part endeth in calamity, from which we are equally far off; and whether part it will light on, is to be tried with uncertainty. And men, when they go to war, use many times to fall first to action, the which ought to come behind; and when they have taken harm, then they fall to reasoning. But since we are neither in such error ourselves, nor do find that you are, we advise you, whilst good counsel is in both our elections, not to break the peace nor violate your oaths; but according to the articles, let the controversy be decided by judgment; or else we call the gods you have sworn by to witness, that if you begin the war, we will endeavour to revenge ourselves the same way that you shall walk in before us.”

The Lacedæmonians amongst themselves take counsel how to proceed.

79. Thus spake the Athenians. After the Lacedæmonians had heard both the complaints of the confederates against the Athenians, and the Athenians’ answer, they put them every one out of the court, and consulted of the business amongst themselves. And the opinions of the greatest part concurred in this; that the Athenians had done unjustly, and ought speedily to be warred on. But Archidamus their king, a man reputed both wise and temperate, spake as followeth.

oration of archidamus. A. C. 432. Ol. 87. 1. Oration of Archidamus. A. C. 432. Ol. 87. 1. Oration of Archidamus. A. C. 432. Ol. 87. 1. Oration of

Archidamus. A. C. 432. Ol. 87. 1. Oration of Archidamus. A. C. 432. Ol. 87. 1. Oration of Archidamus.

80. "Men of Lacedæmon, both I myself have the experience of many wars, and I see you of the same age with me to have the like; insomuch as you cannot desire this war either through inexperience, as many do, nor yet as apprehending it to be profitable or safe. And whosoever shall temperately consider the war we now deliberate of, will find it to be no small one. For though in respect of the Peloponnesians and our neighbour states we have equal strength, and can quickly be upon them; yet against men whose territory is remote, and are also expert seamen, and with all other things excellently furnished, as money, both private and public, shipping, horses, arms, and number, more than any one part of Greece besides; and that have many confederates paying them tribute: against such, I say, why should we lightly undertake the war? And since we are unfurnished, whereon relying should we make such haste to it? On our navy? But therein we are too weak: and if we will provide and prepare against them, it will require time. On our money? But therein also we are more too weak; for neither hath the state any, nor will private men readily contribute. 81. But it may be, some rely on this; that we exceed them in arms and multitude of soldiers, so that we may waste their territories with incursions. But there is much other land under their dominion, and by sea they are able to bring in whatsoever they shall stand in need of. Again, if we essay to alienate their confederates, we must aid them with shipping, because the most of them are islanders. What a war then will this of ours be? For unless we have the better of them in shipping, or take from them their revenue, whereby their navy is maintained, we shall do the most hurt to ourselves. And in this case to let fall the war again, will be no honour for us, when we are chiefly thought to have begun it. As for the hope, that if we waste their country, the war will soon be at an end; let that never lift us up: for I fear we shall transmit it

rather to our children. For it is likely the Athenians have the spirit not to be slaves to their earth; nor as men without experience, to be astonished at the war. 82. And yet I do not advise that we should stupidly suffer our confederates to be wronged, and not apprehend the Athenians in their plots against them; but only not yet to take up arms, but to send and expostulate with them, making no great show neither of war nor of sufferance: and in the mean time to make our provision, and make friends both of Greeks and barbarians, such as in any place we can get of power either in shipping or money; (nor are they to be blamed, that being laid in wait for, as we are by the Athenians, take unto them not Grecians only, but also barbarians for their safety); and withal to set forth our own. If they listen to our ambassadors, best of all; if not, then two or three years passing over our heads, being better appointed, we may war upon them if we will. And when they see our preparation, and hear words that import no less, they will perhaps relent the sooner; especially having their grounds unhurt, and consulting upon commodities extant and not yet spoiled. For we must think their territory to be nothing but an hostage, and so much the more, by how much the better husbanded. The which we ought therefore to spare as long as we may; lest making them desperate, we make them also the harder to expugn. For if unfurnished as we be, at the instigation of the confederates we waste their territory; consider if in so doing we do not make the war both more dishonourable to the Peloponnesians, and also more difficult. For though accusations, as well against cities as private men, may be cleared again, a war for the pleasure of some taken up by all, the success whereof cannot be foreseen, can hardly with honour be letten fall again. 83. Now let no man think it cowardice, that being many cities, we go not presently and invade that one city. For of confederates that bring them in money, they have more than we; and war is not so much war of arms as war of money, by means whereof arms are useful; especially when it is a war of land-men

against sea-men. And therefore let us first provide ourselves of money, and not first raise the war upon the persuasion of the confederates. For we that must be thought the causers of all events, good or bad, have reason also to take some leisure in part to foresee them. 84. As for the slackness and procrastination wherewith we are reproached by the confederates, be never ashamed of it; for the more haste you make to the war, you will be the longer before you end it, for that you go to it unprovided. Besides, our city hath been ever free and well thought of: and this which they object, is rather to be called a modesty proceeding upon judgment. For by that it is, that we alone are neither arrogant upon good success, nor shrink so much as others in adversity. Nor are we, when men provoke us to it with praise, through the delight thereof moved to undergo danger more than we think fit ourselves; nor when they sharpen us with reprehension, doth the smart thereof a jot the more prevail upon us. And this modesty of ours maketh us both good soldiers, and good counsellors: good soldiers, because shame begetteth modesty, and valour is most sensible of shame: good counsellors, in this, that we are brought up more simply than to disesteem the laws, and by severity more modestly than to disobey them: and also in that, we do not, like men exceeding wise in things needless, find fault bravely with the preparation of the enemy and in effect not assault him accordingly; but do think our neighbour's cogitations like our own, and that the events of fortune cannot be discerned by a speech; and do therefore always so furnish ourselves really against the enemy, as against men well advised. For we are not to build our hopes upon the oversights of them, but upon the safe foresight of ourselves. Nor must we think that there is much difference between man and man; but him only to be the best, that hath been brought up amongst the most difficulties. 85. Let us not therefore cast aside the institutions of our ancestors, which we have so long retained to our profit; nor let us of many men's lives, of much money, of many cities, and much

honour, hastily resolve in so small a part of one day, but at leisure; the which we have better commodity than any other to do, by reason of our power. Send to the Athenians about the matter of Potidæa; send about that wherein the confederates say they are injured; and the rather, because they be content to refer the cause to judgment; and one that offereth himself to judgment, may not lawfully be invaded as a doer of injury, before the judgment be given. And prepare withal for the war. So shall you take the most profitable counsel for yourselves, and the most formidable to the enemy.”

Thus spake Archidamus. But Sthenelaidas, then one of the Ephori, stood up last of all and spake to the Lacedæmonians in this manner:

oration of sthenelaidas. A. C. 432. Ol. 87. 1. Oration of Sthenelaidas.

86. “For my part, I understand not the many words used by the Athenians; for though they have been much in their own praises, yet they have said nothing to the contrary but that they have done injury to our confederates and to Peloponnesus. And if they carried themselves well against the Medes, when time was, and now ill against us, they deserve a double punishment; because they are not good as they were, and because they are evil as they were not. Now are we the same we were; and mean not (if we be wise) either to connive at the wrongs done to our confederates, or defer to repair them; for the harm they suffer, is not deferred. Others have much money, many galleys, and many horses; and we have good confederates, not to be betrayed to the Athenians, nor to be defended with words, (for they are not hurt in words), but to be aided with all our power and with speed. Let no man tell me, that after we have once received the injury we ought to deliberate. No, it belongs rather to the doers of injury to spend time in consultation. Wherefore, men of Lancedæmon, decree the war, as becometh the dignity of Sparta; and let not the Athenians grow yet

greater, nor let us betray our confederates, but in the name of the Gods proceed against the doers of injustice.”

The Lacedæmonians by question conclude that the Athenians had broken the peace. A. C. 432. Ol. 87. 1.

87. Having thus spoken, being himself Ephor, he put it to the question in the assembly of the Lacedæmonians; and saying afterwards, that he could not discern whether was the greater cry, (for they used there to give their votes viva voce, and not with balls), and desiring that it might be evident that their minds were inclined most to the war, he put it unto them again, and said, “to whomsoever of you it seemeth that the peace is broken and that the Athenians have done unjustly, let him arise and go yonder,” and withal he showed them a certain place: “and to whomsoever it seemeth otherwise, let him go to the other side”. So they arose and the room was divided; wherein far the greater number were those that held the peace to be broken.

Then calling in the confederates, they told them, that for their own parts their sentence was that the Athenians had done them wrong: but yet they desired to have all their confederates called together, and then to put it to the question again; that if they would, the war might be decreed by common consent. This done, their confederates went home: and so did also afterwards the Athenians, when they had dispatched the business they came about. This decree of the assembly that the peace was broken, was made in the fourteenth year of those thirty years, for which a peace had been formerly concluded after the actions past in Eubœa.

C. 432. Ol. 87. 1. The true cause of this war being the fear the Lacedæmonians had of the power of Athens, the author digresseth to show how that power grew first up.

88. The Lacedæmonians gave sentence that the peace was broken and that war was to be made, not so much for the words of the confederates, as

for fear the Athenian greatness should still increase. For they saw that a great part of Greece was fallen already into their hands.

The means by which the Athenians came to have the command of the common forces of Greece against the Persian, by which they raised their empire. The Athenians return to their city. A. C. 432. Ol. 87. 1. They repair their city, and wall it.

89. Now the manner how the Athenians came to the administration of those affairs by which they so raised themselves, was this. After that the Medes, overcome by sea and land, were departed, and such of them as had escaped by sea to Mycale were there also utterly overthrown; Leotychides king of the Lacedæmonians, then commander of the Grecians at Mycale, with their confederates of Peloponnesus went home. But the Athenians with their confederates of Ionia and the Hellespont, as many as were already revolted from the king, staid behind and besieged Sestus, holden then by the Medes; and when they had lain before it all the winter, they took it abandoned by the barbarians. And after this they set sail from the Hellespont, every one to his own city. And the body of the Athenians, as soon as their territory was clear of the barbarians, went home also, and fetched thither their wives and children, and such goods as they had, from the places where they had been put out to keep; and went about the reparation of their city and walls. For there were yet standing some pieces of the circuit of their wall, and likewise a few houses (though the most were down) which the principal of the Persians had reserved for their own lodgings.

The Lacedæmonians advise them to the contrary for their own ends, pretending the common good. Themistocles adviseth them to build on. A. C. 432. Ol. 87. 1. His subtilty in deluding the Lacedæmonians. The building hastened. Themistocles goeth to Lacedæmon ambassador. He adviseth the Lacedæmonians to send ambassadors to see if the wall went up or not. A. C.

432. Ol. 87. 1. He sendeth letters to Athens secretly, to have those ambassadors stayed till the return of himself and his fellows from Lacedæmon. And hearing that the walls were finished, he justifies it. A. C. 478. Ol. 75. 3. The Lacedæmonians dissembled their dislike.

90. The Lacedæmonians hearing what they went about, sent thither their ambassadors, partly because they would themselves have been glad that neither the Athenians nor any other had had walls; but principally as incited thereto by their confederates, who feared not only the greatness of their navy, which they had not before, but also their courage showed against the Persians: and entreated them not to build their walls, but rather to join with them in pulling down the walls of what cities soever without Peloponnesus had them yet standing: not discovering their meaning, and the jealousy they had of the Athenians; but pretending this, that if the barbarian returned, he might find no fortified city to make the seat of his war, as he did of Thebes: and that Peloponnesus was sufficient for them all whereinto to retire, and from whence to withstand the war. But the Athenians, by the advice of Themistocles, when the Lacedæmonian ambassadors had so said, dismissed them presently with this answer; that they would presently send ambassadors about the business they spake of to Lacedæmon. Now Themistocles willed them to send himself to Lacedæmon for one, and that as speedily as they could; but such as were chosen ambassadors with him, not to send away presently, but to stay them till the walls were so raised as to fight upon them from a sufficient height; and that all the men in the city, in the mean time, both they and their wives and children, sparing neither private nor public edifice that might advance the work, but pulling all down whatsoever, should help to raise it. When he had thus instructed them, adding that he would himself do the rest at Lacedæmon, he took his journey. And when he came to Lacedæmon he went not to the state, but delaying the time excused himself; and when any of those that were in

office, asked him why he did not present himself to the state, answered, “that he stayed for his fellow-ambassadors, who upon some business that fell out were left behind, but he expected them very shortly and wondered they were not come already”. 91. Hearing this, they gave credit to Themistocles for the love they bore him; but when others coming thence averred plainly that the wall went up, and that it was come to good height already, they could not then choose but believe it. Themistocles, when he saw this, wished them not to be led by reports, but rather to send thither some of their own, such as were honest men, and having informed themselves would relate the truth: which they also did. And Themistocles sendeth privily to the Athenians about the same men, to take order for their stay with as little appearance of it as they could, and not to dismiss them till their own ambassadors were returned: (for by this time were arrived those that were joined with him, namely, Abronychus the son of Lysicles, and Aristides the son of Lysimachus, and brought him word that the wall was of a sufficient height): for he feared lest the Lacedæmonians, when they knew the truth, would refuse to let them go. The Athenians therefore kept there those ambassadors, according as it was written to them to do. Themistocles coming now to his audience before the Lacedæmonians, said plainly, “that the city of Athens was already walled, and that sufficiently for the defence of those within: and that if it shall please the Lacedæmonians upon any occasion to send ambassadors unto them, they were to send thenceforward as to men that understood what conduced both to their own, and also to the common good of all Greece. For when they thought it best to quit their city and put themselves into their galleys, he said, they were bold to do it without asking the advice of them: and in common counsel, the advice of the Athenians was as good as the advice of them. And now at this time their opinion is, that it will be best, both for themselves in particular and for all the confederates in common, that their city should be walled. For that in

strength unequal, men cannot alike and equally advise for the common benefit of Greece. Therefore, said he, either must all the confederate cities be unwalled, or you must not think amiss of what is done by us.” The Lacedæmonians when they heard him, though they made no show of being angry with the Athenians; (for they had not sent their ambassadors to forbid them, but by way of advice, to admonish them not to build the wall; besides they bare them affection then, for their courage shown against the Medes); yet they were inwardly offended, because they missed of their will. And the ambassadors returned home of either side without complaint.

The walls of Athens built in haste. A. C. 473. Ol. 76. 4. Themistocles author to the Athenians of assuming the dominion of the sea, and of fortifying Piræus. A. C. 493. Ol. 71. 4. The reason why Themistocles was most addicted to affairs by sea. A. C. 478. Ol. 75. 3.

93. Thus the Athenians quickly raised their walls; the structure itself making manifest the haste used in the building. For the foundation consisteth of stones of all sorts; and those in some places unwrought, and as they were brought to the place. Many pillars also taken from sepulchres, and polished stones were piled together amongst the rest. For the circuit of the city was set every way farther out, and therefore hastening they took alike whatsoever came next to hand. Themistocles likewise persuaded them to build up the rest of Piræus; for it was begun in the year that himself was archon of Athens; as conceiving the place both beautiful, in that it had three natural havens, and that being now seamen, it would very much conduce to the enlargement of their power. For he was indeed the first man that durst tell them, that they ought to take upon them the command of the sea, and withal presently helped them in the obtaining it. By his counsel also it was, that they built the wall of that breadth about Piræus which is now to be seen. For two carts carrying stones met and passed upon it one by another. And yet within it there was neither rubbish nor mortar [to fill it up], but it

was made all of great stones, cut square and bound together with iron and lead. But for height, it was raised but to the half, at the most, of what he had intended. For he would have had it able to hold out the enemy both by the height and breadth; and that a few and the less serviceable men might have sufficed to defend it, and the rest have served in the navy. For principally he was addicted to the sea, because, as I think, he had observed that the forces of the king had easier access to invade them by sea than by land; and thought that Piræus was more profitable than the city above. And oftentimes he would exhort the Athenians, that in case they were oppressed by land, they should go down thither, and with their galleys make resistance against what enemy soever. Thus the Athenians built their walls, and fitted themselves in other kinds, immediately upon the departure of the Persians.

Pausanias sent general of the Greeks, to pursue the relics of the Persian war. A. C. 477. Ol. 75. 3. Pausanias growing insolent, the Ionians offended desire the protection of the Athenians. Pausanias sent for home to answer to certain accusations. A. C. 477. Ol. 75. 3. In his absence, the Grecians give the Athenians the leading of them. Pausanias acquit, but sent general no more. The Grecians refuse the command of Dorcis, sent from Sparta to be their general.

94. In the meantime was Pausanias, the son of Cleombrotus, sent from Lacedæmon commander of the Grecians with twenty galleys out of Peloponnesus; with which went also thirty sail of Athens, besides a multitude of other confederates; and making war on Cyprus, subdued the greatest part of the same: and afterwards, under the same commander, came before Byzantium, which they besieged and won. 95. But Pausanias being now grown insolent, both the rest of the Grecians, and especially the Ionians, who had newly recovered their liberty from the king, offended with him, came unto the Athenians, and requested them for consanguinity's sake to become their leaders, and to protect them from the violence of Pausanias.

The Athenians accepting the motion, applied themselves both to the defence of these, and also to the ordering of the rest of the affairs there in such sort as it should seem best unto themselves. In the mean time the Lacedæmonians sent for Pausanias home, to examine him of such things as they had heard against him. For great crimes had been laid to his charge by the Grecians that came from thence; and his government was rather an imitation of tyranny, than a command in war. And it was his hap to be called home at the same time that the confederates, all but the soldiers of Peloponnesus, out of hatred to him had turned to the Athenians. When he came to Lacedæmon, though he were censured for some wrongs done to private men, yet of the greatest matters he was acquit; especially of Medising, the which seemed to be the most evident of all. Him therefore they sent general no more; but Dorcis, and some others with him, with no great army; whose command the confederates refused; and they finding that, went their ways likewise. And after that the Lacedæmonians sent no more; because they feared lest such as went out, would prove the worse for the state, as they had seen by Pausanias; and also because they desired to be rid of the Persian war, conceiving the Athenians to be sufficient leaders and at that time their friends.

C. 477. Ol. 75. 4. The Athenians assess their confederates for the sustaining of the war. A. C. 469. Ol. 77. 4. The original of the tribute paid to the Athenians.

96. When the Athenians had thus gotten the command, by the confederates' own accord for the hatred they bare to Pausanias, they then set down an order, which cities should contribute money for this war against the barbarians, and which galleys. For they pretended to repair the injuries they had suffered, by laying waste the territories of the king. And then first came up amongst the Athenians the office of Treasurers of Greece, who were receivers of the tribute; for so they called this money contributed. And

the first tribute that was taxed, came to four hundred and sixty talents. The treasury was at Delos, and their meetings were kept there in the temple.

C. 469. Ol. 77. 4. The history of the time between the Persian and Peloponnesian war, pretermitted by other writers, briefly delivered by Thucydides.

97. Now using their authority, at first, in such manner as that the confederates lived under their own laws, and were admitted to common council; by [the] war and administration of the common affairs of Greece from the Persian war to this, what against the barbarians, what against their own innovating confederates, and what against such of the Peloponnesians as chanced always in every war to fall in, they effected those great matters following. Which also I have therefore written, both because this place hath been pretermitted by all that have written before me: (for they have either compiled the Grecian acts before the invasion of the Persians, or that invasion only; of which number is Hellanicus, who hath also touched them in his Attic History, but briefly, and without exact mention of the times): and also because they carry with them a demonstration of how the Athenian empire grew up.

The steps of the Athenians towards their great dominion. The Athenians take Eion: A. C. 469. Ol. 77. 4. and Scyros: and Carystus: A. C. 467. Ol. 78. 2. and Naxos, their confederate. A. C. 466. Ol. 78. 3.

98. And first, under the conduct of Cimon the son of Miltiades they took Eion upon the river Strymon from the Medes by siege, and carried away the inhabitants captives. Then the isle Scyros, in the Ægean sea, inhabited by the Dolopes, the inhabitants whereof they also carried away captives, and planted therein a colony of their own. Likewise they made war on the Carystians alone without the rest of the Eubœans; and those also after a time came in by composition. After this they warred on the revolted Naxians, and brought them in by siege. And this was the first confederate

city, which contrary to the ordinance they deprived of their free estate; though afterwards, as it came to any of their turns, they did the like by the rest.

The cause of revolts from the Athenians. A. C. 466. Ol. 78. 3.

99. Amongst other causes of revolts, the principal was their failing to bring in their tribute and galleys, and their refusing (when they did so) to follow the wars. For the Athenians exacted strictly, and were grievous to them, by imposing a necessity of toil which they were neither accustomed nor willing to undergo. They were also otherwise not so gentle in their government as they had been, nor followed the war upon equal terms; and could easily bring back to their subjection such as should revolt. And of this the confederates themselves were the causes. For through this refusal to accompany the army, the most of them, to the end they might stay at home, were ordered to excuse their galleys with money, as much as it came to: by which means the navy of the Athenians was increased at the cost of their confederates; and themselves unprovided and without means to make war, in case they should revolt.

The Athenians defeat the Persian upon the river of Eurymedon. They war on Thasos. A. C. 465. Ol. 78. 3. 4. They take Amphipolis, and afterwards receive a great overthrow at Drabescus in Thrace. A. C. 465. Ol. 78. 3. 4. The Lacedæmonians intending to invade Attica, are hindered by an earthquake. A. C. 465. A. C. 463. Ol. 79. 1. 2. Thasos rendered to the Athenians. The Lacedæmonians send for aid to the Athenians, in their war against Ithome. A. C. 461. Ol. 79. 3. 4. The first dissension between the Lacedæmonians and the Athenians. The Athenians being had in suspicion by the Lacedæmonians, join with the Argives. A. C. 461. Ol. 79. 3. 4.

100. After this it came to pass that the Athenians and their confederates fought against the Medes, both by land and by water, upon the river of Eurymedon in Pamphilia; and in one and the same day the Athenians had

victory in both; and took or sunk all the Phœnician fleet, to the number of two hundred galleys. After this again happened the revolt of Thasos, upon a difference about the places of trade and about the mines they possessed in the opposite parts of Thrace. And the Athenians going thither with their fleet, overthrew them in a battle at sea, and landed in the island. But having about the same time sent ten thousand of their own and of their confederates' people unto the river of Strymon, for a colony to be planted in a place called then the Nine-ways, now Amphipolis; they won the said Nine-ways, which was held by the Eidonians; but advancing farther towards the heart of the country of Thrace, they were defeated at Drabescus, a city of the Eidonians, by the whole power of the Thracians, that were enemies to this new-built town of the Nine-ways. 101. The Thasians in the meantime, being overcome in divers battles and besieged, sought aid of the Lacedæmonians, and entreated them to divert the enemy by an invasion of Attica: which, unknown to the Athenians, they promised to do, and also had done it, but by an earthquake that then happened they were hindered. In which earthquake their Helots, and of neighbouring towns the Thuriatæ and Æthæans, revolted and seized on Ithome. Most of these Helots were the posterity of the ancient Messenians, brought into servitude in former times; whereby also it came to pass that they were called all Messenians. Against these had the Lacedæmonians now a war at Ithome. The Thasians in the third year of the siege rendered themselves to the Athenians, upon condition to raze their walls; to deliver up their galleys; to pay both the money behind and for the future, as much as they were wont; and to quit both the mines and the continent. 102. The Lacedæmonians, when the war against those in Ithome grew long, amongst other their confederates sent for aid to the Athenians; who also came with no small forces under the command of Cimon. They were sent for principally for their reputation in mural assaults, the long continuance of the siege seeming to require men of ability in that

kind; whereby they might perhaps have gotten the place by force. And upon this journey, grew the first manifest dissension between the Lacedæmonians and the Athenians. For the Lacedæmonians, when they could not take the place by assault, fearing lest the audacious and innovating humour of the Athenians, whom withal they esteemed of a contrary race, might, at the persuasion of those in Ithome, cause some alteration if they staid, dismissed them alone of all the confederates; not discovering their jealousy, but alleging that they had no farther need of their service. But the Athenians perceiving that they were not sent away upon good cause, but only as men suspected, made it a heinous matter; and conceiving that they had better deserved at the Lacedæmonians' hands, as soon as they were gone, left the league which they had made with the Lacedæmonians against the Persian, and became confederates with their enemies the Argives; and then both Argives and Athenians took the same oath and made the same league with the Thessalians.

The Helots in Ithome, after ten years' siege, compound and quit Peloponnesus. A. C. 455. Ol. 81. 1. 2. The Athenians receive them, and place them in Naupactus. Megara revolteth from the Lacedæmonians to the Athenians.

103. Those in Ithome, when they could no longer hold out, in the tenth year of the siege rendered the place to the Lacedæmonians, upon condition of security to depart out of Peloponnesus, and that they should no more return; and whosoever should be taken returning, to be the slave of him that should take him. For the Lacedæmonians had before been warned by a certain answer of the Pythian oracle, to let go the suppliant of Jupiter Ithometes. So they came forth, they and their wives and their children. And the Athenians, for hatred they bore to the Lacedæmonians, received them and put them into Naupactus; which city they had lately taken from the Locrians of Ozolæ. The Megareans also revolted from the Lacedæmonians

and came to the league of the Athenians, because they were holden down by the Corinthians with a war about the limits of their territories. Whereupon Megara and Pegæ were put into the hands of the Athenians; who built for the Megareans the long walls from the city to Nisæa, and maintained them with a garrison of their own. And from hence it was chiefly, that the vehement hatred grew of the Corinthians against the Athenians.

C. 460. Ol. 80. 1. The Athenians send an army into Egypt, to aid the rebels against the king of Persia. Cairo. The Athenians fight by land, against the Corinthians and Epidaurians. A. C. 458. Ol. 80. 2. 3. After that, against the Peloponnesians. Then against the Æginetæ. The Peloponnesians aid Ægina. A. C. 457. Ol. 80. 3. 4. A. C. 457. Ol. 80. 3. 4. The Corinthians receive a great loss in Megaris. A. C. 457. Ol. 80. 3. 4.

104. Moreover Inarus, the son of Psammeticus, an African, king of the Africans that confine on Egypt, making war from Mareia above Pharus, caused the greatest part of Egypt to rebel against the king Artaxerxes; and when he had taken the government of them upon himself, he brought in the Athenians to assist him; who chancing to be then warring on Cyprus with two hundred galleys, part their own and part their confederates, left Cyprus and went to him. And going from the sea up the river of Nilus, after they had made themselves masters of the river and of two parts of the city of Memphis, assaulted the third part, called the White-Wall. Within were of the Medes and Persians, such as had escaped, and of the Egyptians, such as had not revolted amongst the rest. 105. The Athenians came also with a fleet to Halias, and landing their soldiers fought by land with the Corinthians and Epidaurians; and the Corinthians had the victory. After this, the Athenians fought by sea against the fleet of the Peloponnesians at Cecryphaleia, and the Athenians had the victory. After this again, the war being on foot of the Athenians against the Æginetæ, a great battle was fought between them by sea upon the coast of Ægina, the confederates of

both sides being at the same, in which the Athenians had the victory; and having taken seventy galleys landed their army and besieged the city, under the conduct of Leocrates the son of Stræbus. After this, the Peloponnesians desiring to aid the Æginetæ, sent over into Ægina itself three hundred men of arms, of the same that had before aided the Corinthians and Epidaurians, and with other forces seized on the top of Geraneia. And the Corinthians and their confederates came down from thence into the territory of Megara; supposing that the Athenians, having much of their army absent in Ægina and in Egypt, would be unable to aid the Megareans, or if they did, would be forced to rise from before Ægina. But the Athenians stirred not from Ægina, but those that remained at Athens, both young and old, under the conduct of Myronides went to Megara; and after they had fought with doubtful victory, they parted asunder again, with an opinion on both sides not to have had the worse in the action. And the Athenians, who notwithstanding had rather the better, when the Corinthians were gone away erected a trophy. But the Corinthians having been reviled at their return by the ancient men of the city, about twelve days after came again prepared and set up their trophy likewise, as if the victory had been theirs. Hereupon the Athenians sallying out of Megara with a huge shout, both slew those that were setting up the trophy, and charging the rest got the victory. 106. The Corinthians being overcome, went their way; but a good part of them, being hard followed and missing their way, lighted into the enclosed ground of a private man, which fenced with a great ditch had no passage through. Which the Athenians perceiving, opposed them at the place by which they entered with their men of arms, and encompassing the ground with their light armed soldiers killed those that were entered with stones. This was a great loss to the Corinthians; but the rest of their army got home again.

The Athenians build their long walls from both sides of the city to the sea. A. C. 457. Ol. 80. 3. 4. The Lacedæmonians fight with the Athenians at

Tanagra. A. C. 457. Ol. 80. 4. A. C. 456. Ol. 80. 4. The Athenians overthrow the Bœotians at Cænophyta, [that is to say, the vineyards], and subdue Bœotia and Phocis. Ægina yielded to the Athenians. The Athenians sail round Peloponnesus, and waste it.

107. About this time the Athenians began the building of their long walls, from the city down to the sea, the one reaching to the haven called Phaleron, the other to Peiræus. The Phoceans also making war upon Bœum, Cytinium, and Erineus, towns that belonged to the Dorians, of whom the Lacedæmonians are descended, and having taken one of them, the Lacedæmonians, under the conduct of Nicomedes the son of Cleombrotus, in the place of Pleistoanactes son of king Pausanias, who was yet in his minority, sent unto the aid of the Dorians fifteen hundred men of arms of their own, and of their confederates ten thousand. And when they had forced the Phoceans upon composition to surrender the town they had taken, they went their ways again. Now if they would go home by sea through the Crisæan Gulf, the Athenians going about with their fleet would be ready to stop them; and to pass over Geraneia they thought unsafe, because the Athenians had in their hands Megara and Pegæ. For Geraneia was not only a difficult passage of itself, but was also always guarded by the Athenians. They thought good therefore to stay amongst the Bœotians, and to consider which way they might most safely go through. Whilst they were there, there wanted not some Athenians, that privily solicited them to come to the city, hoping to have put the people out of government, and to have demolished the long walls then building. But the Athenians, with the whole power of their city, and a thousand Argives, and other confederates as they could be gotten together, in all fourteen thousand men, went out to meet them: for there was suspicion that they came thither to depose the democracy. There also came to the Athenians certain horsemen out of Thessaly, which in the battle turned to the Lacedæmonians. 108. They

fought at Tanagra of Bœotia, and the Lacedæmonians had the victory; but the slaughter was great on both sides. Then the Lacedæmonians entering into the territories of Megara, and cutting down the woods before them, returned home by the way of Geraneaia and the Isthmus. Upon the two-and-sixtieth day after this battle, the Athenians, under the conduct of Myronides, made a journey against the Bœotians and overthrew them at Œenophyta, and brought the territories of Bœotia and Phocis under their obedience; and withal razed the walls of Tanagra, and took of the wealthiest of the Locrians of Opus a hundred hostages; and finished also at the same time their long walls at home. After this, Ægina also yielded to the Athenians on these conditions: that they should have their walls pulled down, and should deliver up their galleys, and pay their taxed tribute for the time to come. Also the Athenians made a voyage about Peloponnesus wherein they burnt the arsenal of the Lacedæmonians' navy, took Chalcis a city of the Corinthians, and landing their forces in Sicyonia overcame in the fight those that made head against them.

C. 456. Ol. 80. 4. The end of the Athenian forces in Egypt. A supply of Athenians going to Egypt, defeated by the forces of the king. A. C. 456. Ol. 80. 4.

109. All this while the Athenians stayed still in Egypt, and saw much variety of war. First the Athenians were masters of Egypt: and the king of Persia sent one Megabazus, a Persian, with money to Lacedæmon, to procure the Peloponnesians to invade Attica, and by that means to draw the Athenians out of Egypt. But when this took no effect, and money was spent to no purpose, Megabazus returned with the money he had left into Asia. And then was Megabazus the son of Zopyrus, a Persian, sent into Egypt with great forces, and coming in by land overthrew the Egyptians and their confederates in a battle, drave the Grecians out of Memphis, and finally inclosed them in the isle of Prosopis. There he besieged them a year and a

half, till such time as having drained the channel and turned the water another way, he made their galleys lie aground and the island for the most part continent, and so came over and won the island with land soldiers. 110. Thus was the army of the Grecians lost after six years' war; and few of many passing through Africa saved themselves in Cyrene: but the most perished. So Egypt returned to the obedience of the king, except only Amyrtæus, that reigned in the fens. For him they could not bring in, both because the fens are great, and the people of the fens of all the Egyptians the most warlike. But Inarus, king of the Africans, and author of all this stir in Egypt, was taken by treason and crucified. The Athenians moreover had sent fifty galleys more into Egypt, for a supply of those that were there already; which putting in at Mendesium, one of the mouths of Nilus, knew nothing of what had happened to the rest: and being assaulted from the land by the army, and from the sea by the Phœnician fleet, lost the greatest part of their galleys, and escaped home again with the lesser part. Thus ended the great expedition of the Athenians and their confederates into Egypt.

The Athenians invade Thessaly. A. C. 454. Ol. 81. 2. 3. The Athenians under Pericles besiege Cœniades.

111. Also Orestes the son of Echekratidas, king of the Thessalians, driven out of Thessaly, persuaded the Athenians to restore him. And the Athenians, taking with them the Bœotians and Phœceans, their confederates, made war against Pharsalus, a city of Thessaly; and were masters of the field as far as they strayed not from the army, (for the Thessalian horsemen kept them from straggling); but could not win the city nor yet perform anything else of what they came for, but came back again without effect, and brought Orestes with them. Not long after this, a thousand Athenians went aboard the gallies that lay at Pegæ, (for Pegæ was in the hands of the Athenians), under the command of Pericles the son of Xantippus, and sailed into Sicyonia, and landing put to flight such of the Sicyonians as made

head; and then presently took up forces in Achaia; and putting over made war on Cēnias, a city of Acarnania, which they besieged. Nevertheless they took it not, but returned home.

Truce for five years between the Athenians and Peloponnesians. The Athenians war on Cyprus. Cimon dieth. A. C. 449. Ol. 82. 3. 4. The Holy War. A. C. 448. Ol. 82. 4./83. 1. The Athenians recover Chæroneia, taken by the Bœotian outlaws A. C. 448. Ol. 82. 4./83. 1. The Athenians defeated at Coroneia by the outlaws, lose Bœotia Eubœa revolteth from the Athenians. A. C. 446. Ol. 83. 2. 3. Megara revolteth Ol. 83. 3. A. C. 445 Ol. 83. 3. Eubœa subdued by the Athenians Peace for thirty years between the Athenians and Peloponnesians. A. C. 440. Ol. 85. 1. The Athenians war upon Samos. A. C. 440. Ol. 85. 1. A. C. 440. Ol. 85. 1. Samos yielded to the Athenians. A. C. 440. Ol. 85. 1.

112. Three years after this, was a truce made between the Peloponnesians and Athenians for five years. And the Athenians gave over the Grecian war; and with two hundred galleys, part their own, and part confederates, under the conduct of Cimon, made war on Cyprus. Of these there went sixty sail into Egypt, sent for by Amyrtæus that reigned in the fens; and the rest lay at the siege of Citium. But Cimon there dying and a famine arising in the army, they left Citium; and when they had passed Salamis in Cyprus, fought at once both by sea and land against the Phœnicians, Cyprians, and Cilicians, and having gotten victory in both returned home, and with them the rest of their fleet, now come back from Egypt. After this, the Lacedæmonians took in hand the war called the holy war; and having won the temple at Delphi, delivered the possession thereof to the Delphians. But the Athenians afterward, when the Lacedæmonians were gone, came with their army, and regaining it, delivered the possession to the Phoceans. 113. Some space of time after this, the outlaws of Bœotia being seized of Orchomenus and Chæroneia and certain other places of

Bœotia, the Athenians made war upon those places, being their enemies, with a thousand men of arms of their own and as many of their confederates as severally came in, under the conduct of Tolmidas the son of Tolmæus. And when they had taken Chæroneia, they carried away the inhabitants captives, and leaving a garrison in the city departed. In their return, those outlaws that were in Orchomenus, together with the Locrians of Opus, and the Eubœan outlaws, and others of the same faction, set upon them at Coroneia, and overcoming the Athenians in battle some they slew and some they took alive. Whereupon the Athenians relinquished all Bœotia, and made peace with condition to have their prisoners released. So the outlaws and the rest returned, and lived again under their own laws. 114. Not long after revolted Eubœa from the Athenians; and when Pericles had already passed over into it with the Athenian army, there was brought him news that Megara was likewise revolted, and that the Peloponnesians were about to invade Attica; and that the Megareans had slain the Athenian garrison, except only such as fled into Nisæa. Now the Megareans, when they revolted, had gotten to their aid the Corinthians, Epidaurians, and Sicyonians. Wherefore Pericles forthwith withdrew his army from Eubœa; and the Lacedæmonians afterward brake into Attica, and wasted the country about Eleusine and Thriasium, under the conduct of Pleistoanax the son of Pausanias, king of Lacedæmon, and came no farther on, but so went away. After which the Athenians passed again into Eubœa, and totally subdued it: the Hestiæans they put quite out, taking their territory into their own hands; but ordered the rest of Eubœa according to composition made. 115. Being returned from Eubœa, within a while after they made a peace with the Lacedæmonians and their confederates for thirty years; and rendered Nisæa, Achaia, Pegæ, and Trœzene, (for these places the Athenians held of theirs), to the Peloponnesians. In the sixth year of this peace fell out the war between the Samians and Milesians, concerning Priene; and the Milesians

being put to the worse, came to Athens and exclaimed against the Samians. Wherein also certain private men of Samos itself took part with the Milesians, out of desire to alter the form of government. Whereupon the Athenians went to Samos with a fleet of forty galleys, and set up the democracy there, and took of the Samians fifty boys and as many men for hostages; which when they had put into Lemnos, and set a guard upon them, they came home. But certain of the Samians (for some of them not enduring the popular government were fled into the continent) entering into a league with the mightiest of them in Samos, and with Pissuthnes the son of Hystaspes, who then was governor of Sardis, and levying about seven hundred auxiliary soldiers, passed over into Samos in the evening, and first set upon the popular faction, and brought most of them into their power; and then stealing their hostages out of Lemnos, they revolted, and delivered the Athenian guard and such captains as were there into the hands of Pissuthnes, and withal prepared to make war against Miletus. With these also revolted the Byzantines. 116. The Athenians, when they heard of these things, sent to Samos sixty galleys, sixteen whereof they did not use; (for some of them went into Caria to observe the fleet of the Phœnicians, and some to fetch in succours from Chios and Lesbos); but with the forty-four that remained, under the command of Pericles and nine others, fought with seventy galleys of the Samians, (whereof twenty were such as served for the transport of soldiers), as they were coming altogether from Miletus; and the Athenians had the victory. After this came a supply of forty galleys more from Athens, and from Chios and Lesbos twenty-five. With these having landed their men, they overthrew the Samians in battle, and besieged the city; which they inclosed with a triple wall, and shut it up by sea with their galleys. But Pericles taking with him sixty galleys out of the road, made haste towards Caunus and Caria, upon intelligence of the coming against them of the Phœnician fleet. For Stesagoras with five galleys was already

gone out of Samos, and others out of other places, to meet the Phœnicians. 117. In the mean time, the Samians coming suddenly forth with their fleet and falling upon the harbour of the Athenians, which was unfortified, sunk the galleys that kept watch before it, and overcame the rest in fight; insomuch that they became masters of the sea near their coast for about fourteen days together, importing and exporting what they pleased. But Pericles returning shut them up again with his galleys. And after this, there came to him from Athens a supply of forty sail, with Thucydides, Agnon, and Phormio, and twenty with Tlepolemus and Anticles; and from Chios and Lesbos thirty more. And though the Samians fought against these a small battle at sea, yet unable to hold out any longer, in the ninth month of the siege they rendered the city upon composition: namely, to demolish their walls, to give hostages, to deliver up their navy, and to repay the money spent by the Athenians in the war at days appointed. And the Byzantines also yielded, with condition to remain subject to them in the same manner as they had been before their revolt.

The business about Corcyra and Potidæa, before related. Between the Persian and Peloponnesian war, fifty years. The oracle consulted by the Lacedæmonians, encourageth them to the war. A. C. 432. Ol. 86. 4. Consultation of the Peloponnesians in general, whether they should enter into a war or not. A. C. 432. Ol. 86. 4. / 87. 1.

118. Now not many years after this happened the matters before related, of the Corcyræans and the Potidæans, and whatsoever other intervenient pretext of this war. These things done by the Grecians one against another or against the barbarians, came to pass all within the compass of fifty years at most, from the time of the departure of Xerxes to the beginning of this present war. In which time, the Athenians both assured their government over the confederates, and also much enlarged their own particular wealth. This the Lacedæmonians saw, and opposed not, save now and then a little;

but, as men that had ever before been slow to war without necessity, and also for that they were hindered sometimes with domestic war, for the most part of the time stirred not against them: till now at last, when the power of the Athenians was advanced manifestly indeed, and that they had done injury to their confederates, they could forbear no longer; but thought it necessary to go in hand with the war with all diligence, and to pull down, if they could, the Athenian greatness. For which purpose it was by the Lacedæmonians themselves decreed, that the peace was broken and that the Athenians had done unjustly: and also having sent to Delphi, and enquired of Apollo, whether they should have the better in the war or not; they received, as it is reported, this answer: “That if they warred with their whole power, they should have victory, and that himself would be on their side, both called and uncalled”. 119. Now when they had assembled their confederates again, they were to put it to the question amongst them, “whether they should make war or not”. And the ambassadors of the several confederates coming in, and the council set, as well the rest spake what they thought fit, most of them accusing the Athenians of injury, and desiring the war; as also the Corinthians, who had before entreated the cities every one severally to give their vote for the war, fearing lest Potidæa should be lost before help came, being then present spake last of all to this effect.

oration of the ambassadors of corinth. A. C. 432. Ol. 86. 4./87. 1. Oration of the Corinthians. A. C. 432. Ol. 86. 4./87. 1. Oration of the Corinthians. A. C. 432. Ol. 86. 4./87. 1. Oration of the Corinthians. A. C. 432. Ol. 86. 4./87. 1. Oration of the Corinthians.

120. “Confederates, we can no longer accuse the Lacedæmonians, they having both decreed the war themselves, and also assembled us to do the same. For it is fit for them who have the command in a common league, as they are honoured of all before the rest, so also (administering their private affairs equally with others) to consider before the rest of the common

business. And though as many of us as have already had our turns with the Athenians, need not be taught to beware of them: yet it were good for those that dwell up in the land, and not as we, in places of traffic on the sea side, to know, that unless they defend those below, they shall with a great deal the more difficulty both carry to the sea the commodities of the seasons, and again more hardly receive the benefits afforded to the inland countries from the sea; and also not to mistake what is now spoken, as if it concerned them not; but to make account, that if they neglect those that dwell by the sea, the calamity will also reach to themselves; and that this consultation concerneth them no less than us; and therefore not to be afraid to change their peace for war. For though it be the part of discreet men to be quiet, unless they have wrong; yet it is the part of valiant men, when they receive injury, to pass from peace into war, and after success, from war to come again to composition: and neither to swell with the good success of war, nor to suffer injury through pleasure taken in the ease of peace. For he whom pleasure makes a coward, if he sit still, shall quickly lose the sweetness of the ease that made him so. And he that in war is made proud by success, observeth not that his pride is grounded upon unfaithful confidence. For though many things ill advised, come to good effect against enemies worse advised; yet more, thought well advised, have fallen but badly out against well advised enemies. For no man comes to execute a thing with the same confidence he premeditates it. For we deliver opinions in safety, whereas in the action itself we fail through fear. 121. As for the war, at this time we raise it, both upon injuries done us and upon other sufficient allegations; and when we have repaired our wrongs upon the Athenians, we will also in due time lay it down. And it is for many reasons probable that we shall have the victory: first, because we exceed them in number; and next, because when we go to any action intimated, we shall be all of one fashion. And as for a navy, wherein consisteth the strength of the Athenians, we shall provide it, both

out of every one's particular wealth, and with the money at Delphi and Olympia. For taking this at interest, we shall be able to draw from them their foreign mariners by offer of greater wages. For the forces of the Athenians are rather mercenary than domestic: whereas our own power is less obnoxious to such accidents, consisting more in the persons of men than in money. And if we overcome them but in one battle by sea, in all probability they are totally vanquished. And if they hold out, we also shall with longer time apply ourselves to naval affairs. And when we shall once have made our skill equal to theirs, we shall surely overmatch them in courage. For the valour that we have by nature, they shall never come unto by teaching; but the experience which they exceed us in, that must we attain unto by industry. And the money wherewith to bring this to pass, it must be all our parts to contribute. For else it were a hard case, that the confederates of the Athenians should not stick to contribute to their own servitude; and we should refuse to lay out our money to be revenged of our enemies and for our own preservation, and that the Athenians take not our money from us and even with that do us mischief. 122. We have also many other ways of war; as the revolt of their confederates, which is the principal means of lessening their revenue; the building of forts in their territory; and many other things which one cannot now foresee. For the course of war is guided by nothing less than by the points of our account, but of itself contriveth most things upon the occasion. Wherein he that complies with it with most temper, standeth the firmest; and he that is most passionate, oftenest miscarries. Imagine we had differences each of us about the limits of our territory with an equal adversary; we must undergo them. But now the Athenians are a match for us all at once, and one city after another too strong for us. Insomuch that unless we oppose them jointly, and every nation and city set to it unanimously, they will overcome us asunder without labour. And know, that to be vanquished (though it trouble you to hear it)

brings with it no less than manifest servitude: which but to mention as a doubt, as if so many cities could suffer under one, were very dishonourable to Peloponnesus. For it must then be thought that we are either punished upon merit, or else that we endure it out of fear, and so appear degenerate from our ancestors. For by them the liberty of all Greece hath been restored: whereas we for our part assure not so much as our own; but claiming the reputation of having deposed tyrants in the several cities, suffer a tyrant city to be established amongst us. Wherein we know not how we can avoid one of these three great faults, foolishness, cowardice, or negligence. For certainly you avoid them not by imputing it to that which hath done most men hurt, contempt of the enemy: for contempt, because it hath made too many men miscarry, hath gotten the name of foolishness.

C. 432. Ol. 86. 4./87. 1. Oration of the Corinthians.

123 “But to what end should we object matters past, more than is necessary to the business in hand? We must now by helping the present, labour for the future: for it is peculiar to our country to attain honour by labour. And though you be now somewhat advanced in honour and power, you must not therefore change the custom: for there is no reason that what was gotten in want, should be lost by wealth. But we should confidently go in hand with the war, as for many other causes so also for this, that both the God hath by his oracle advised us thereto and promised to be with us himself: and also for that the rest of Greece, some for fear and some for profit, are ready to take our parts. Nor are you they that first break the peace, which the God, inasmuch as he doth encourage us to the war, judgeth violated by them; but you fight rather in defence of the same. For not he breaketh the peace that taketh revenge, but he that is the first invader.

C. 432. Ol. 87. 1./86. 4. Oration of the Corinthians.

124. “So that seeing it will be every way good to make the war, and since in common we persuade the same; and seeing also that both to the

cities and to private men it will be the most profitable course, put off no longer neither the defence of the Potidæans; who are Dorians, and besieged (which was wont to be contrary) by Ionians; nor the recovery of the liberty of the rest of the Grecians. For it is a case that admitteth not delay, when they are some of them already oppressed, and others (after it shall be known we met and durst not right ourselves) shall shortly after undergo the like. But think, confederates, you are now at a necessity, and that this is the best advice: and therefore give your votes for the war, not fearing the present danger, but coveting the long peace proceeding from it. For though by war groweth the confirmation of peace; yet for love of ease to refuse the war, doth not likewise avoid the danger. But making account that a tyrant city set up in Greece, is set up alike over all, and reigneth over some already, and the rest in intention, we shall bring it again into order by the war; and not only live for the time to come out of danger ourselves, but also deliver the already enthralled Grecians out of servitude.” Thus said the Corinthians.

The war decreed by all the confederates.

125. The Lacedæmonians, when they had heard the opinion of them all, brought the balls to all the confederates present in order, from the greatest state to the least: and the greatest part gave their votes for the war. Now after the war was decreed, though it were impossible for them to go in hand with it presently, because they were unprovided, and every state thought good without delay severally to furnish themselves of what was necessary; yet there passed not fully a year in this preparation before Attica was invaded, and the war openly on foot.

The Lacedæmonians send embassages to the Athenians about expiation of sacrileges, only to pick better quarrels for the war. A. C. 612. Ol. 42. 1. A. C. 612. Ol. 42. 1. A. C. 612. Ol. 42. 1.

126. In the mean time they sent ambassadors to the Athenians with certain criminations, to the end that if they would give ear to nothing, they

might have all the pretext that could be for raising of the war. And first the Lacedæmonians, by their ambassadors to the Athenians, required them to banish such as were under curse of the goddess Minerva for pollution of sanctuary. Which pollution was thus. There had been one Cylon an Athenian, a man that had been victor in the Olympian exercises, of much nobility and power amongst those of old time, and that had married the daughter of Theagenes, a Megarean, in those days tyrant of Megara. To this Cylon, asking counsel at Delphi, the God answered, that on the greatest festival day he should seize the citadel of Athens. He therefore having gotten forces of Theagenes, and persuaded his friends to the enterprise, seized on the citadel at the time of the Olympic holidays in Peloponnesus, with intention to take upon him the tyranny: esteeming the feast of Jupiter to be the greatest, and to touch withal on his particular, in that he had been victor in the Olympian exercises. But whether the feast spoken of were meant to be the greatest in Attica, or in some other place, neither did he himself consider, nor the oracle make manifest. For there is also amongst the Athenians the Diasia, which is called the greatest feast of Jupiter Meilichius, and is celebrated without the city; wherein in the confluence of the whole people many men offered sacrifices, not of living creatures, but such as was the fashion of the natives of the place. But he, supposing he had rightly understood the oracle, laid hand to the enterprise. And when the Athenians heard of it, they came with all their forces out of the fields, and lying before the citadel besieged it. But the time growing long, the Athenians, wearied with the siege, went most of them away; and left both the guard of the citadel and the whole business to the nine archontes, with absolute authority to order the same as to them it should seem good. For at that time, most of the affairs of the commonweal were administered by those nine archontes. Now those that were besieged with Cylon, were for want of both victual and water in very evil estate; and therefore Cylon and a

brother of his fled privily out; but the rest, when they were pressed and some of them dead with famine, sat down as suppliants by the altar that is in the citadel. And the Athenians, to whose charge was committed the guard of the place, raising them upon promise to do them no harm, put them all to the sword. Also they had put to death some of those that had taken sanctuary at the altars of the severe Goddesses, as they were going away. And from this the Athenians, both themselves and their posterity, were called accursed and sacrilegious persons. Hereupon the Athenians banished those that were under the curse: and Cleomenes, a Lacedæmonian, together with the Athenians in a sedition, banished them afterwards again: and not only so, but disinterred and cast forth the bodies of such of them as were dead. Nevertheless there returned of them afterwards again; and there are of their race in the city unto this day.

C. 612. Ol. 42. 1. Pericles always adverse to the Lacedæmonians.

127. This pollution therefore the Lacedæmonians required them to purge their city of: principally forsooth, as taking part with the gods; but knowing withal, that Pericles the son of Xantippus, was by the mother's side one of that race. For they thought if Pericles were banished, the Athenians would the more easily be brought to yield to their desire. Nevertheless, they hoped not so much that he should be banished, as to bring him into the envy of the city; as if the misfortune of him were in part the cause of the war. For being the most powerful of his time, and having the sway of the state, he was in all things opposite to the Lacedæmonians; not suffering the Athenians to give them the least way, but inciting them to the war.

The Athenians require the Lacedæmonians to expiate the violation of sanctuary also on their parts. A. C. 466. Ol. 78. 3. The occasion and manner of the death of Pausanias in the temple of Pallas Chalciœca. A. C. 470. Ol. 77. 3. Pausanias practiseth with the king of Persia against the state of Greece. A. C. 478.7. Ol. 75. 3. The Letter of Pausanias to the king.

128. Contrariwise, the Athenians required the Lacedæmonians to banish such as were guilty of breach of sanctuary at Tænarus. For the Lacedæmonians, when they had caused their Helots, suppliants in the temple of Neptune at Tænarus, to forsake sanctuary, slew them: for which cause they themselves think it was, that the great earthquake happened afterwards at Sparta. Also they required them to purge their city of the pollution of sanctuary in the temple of Pallas Chalciœca; which was thus. After that Pausanias the Lacedæmonian was recalled by the Spartans from his charge in Hellespont, and having been called in question by them was absolved, though he was no more sent abroad by the state, yet he went again into Hellespont in a galley of Hermione as a private man, without leave of the Lacedæmonians; to the Grecian war, as he gave out, but in truth to negotiate with the king, as he had before begun, aspiring to the principality of Greece. Now the benefit that he had laid up with the king, and the beginning of the whole business, was at first from this. When after his return from Cyprus he had taken Byzantium; when he was there the first time, (which being holden by the Medes, there were taken in it some near to the king, and of his kindred), unknown to the rest of the confederates he sent unto the king those near ones of his which he had taken, and gave out they were run away. This he practised with one Gongylus, an Eretrian, to whose charge he had committed both the town of Byzantium and the prisoners. Also he sent letters unto him, which Gongylus carried, wherein, as was afterwards known, was thus written: "Pausanias, General of the Spartans, being desirous to do thee a courtesy, sendeth back unto thee these men, whom he hath by arms taken prisoners. And I have a purpose, if the same seem also good unto thee, to take thy daughter in marriage, and to bring Sparta and the rest of Greece into thy subjection. These things I account myself able to bring to pass, if I may communicate my counsels

with thee. If therefore any of these things do like thee, send some trusty man to the sea-side, by whose mediation we may confer together.”

C. 478.7. Ol. 75. 3. The Letter of Xerxes to Pausanias.

129. These were the contents of the writing. Xerxes being pleased with the letter, sends away Artabazus the son of Pharnaces to the sea-side, with commandment to take the government of the province of Dascylis, and to dismiss Megabates, that was governor there before: and withal, gives him a letter to Pausanias, which he commanded him to send over to him with speed to Byzantium, and to show him the seal, and well and faithfully to perform whatsoever in his affairs he should by Pausanias be appointed to do. Artabazus, after he arrived, having in other things done as he was commanded, sent over the letter; wherein was written this answer: “Thus saith king Xerxes to Pausanias: For the men which thou hast saved and sent over the sea unto me from Byzantium, thy benefit is laid up in our house indelibly registered for ever: and I like also of what thou hast propounded. And let neither night nor day make thee remiss in the performance of what thou hast promised unto me. Neither be thou hindered by the expense of gold and silver, or multitude of soldiers requisite, whithersoever it be needful to have them come. But with Artabazus, a good man whom I have sent unto thee, do boldly both mine and thine own business, as shall be most fit for the dignity and honour of us both.”

Pausanias groweth proud upon the receipt of these letters. A. C. 478.7. Ol. 75. 3.

130. Pausanias having received these letters, whereas he was before in great authority for his conduct at Plataea, became now many degrees more elevated; and endured no more to live after the accustomed manner of his country, but went apparelled at Byzantium after the fashion of Persia; and when he went through Thrace, had a guard of Medes and Egyptians, and his table likewise after the Persian manner. Nor was he able to conceal his

purpose; but in trifles made apparent beforehand the greater matters he had conceived of the future. He became moreover difficult of access; and would be in such choleric passions toward all men indifferently, that no man might endure to approach him; which was also none of the least causes why the confederates turned from him to the Athenians.

C. 470. Ol. 77. 3. A. C. 469. Ol. 77. 4. Pausanias his ambition, in dedication of the Tripode at Delphi. A. C. 469. Ol. 77. 4.

131 When the Lacedæmonians heard of it, they called him home the first time. And when being gone out the second time without their command in a galley of Hermione, it appeared that he continued still in the same practices; and after he was forced out of Byzantium by siege of the Athenians, returned not to Sparta, but news came that he had seated himself at Colonæ in the country of Troy, practising still with the barbarians, and making his abode there for no good purpose: then the ephori forebore no longer, but sent unto him a public officer with the scytale, commanding him not to depart from the officer; and in case he refused, denounced war against him. But he, desiring as much as he could to decline suspicion, and believing that with money he should be able to discharge himself of his accusations, returned unto Sparta the second time. And first he was by the ephori committed to ward; (for the ephori have power to do this to their king); but afterwards procuring his enlargement, he came forth, and exhibited himself to justice against such as had any thing to allege against him. 132. And though the Spartans had against him no manifest proof, neither his enemies nor the whole city, whereupon to proceed to the punishment of a man both of the race of their kings, and at that present in great authority: (for Plistarchus the son of Leonidas, being king and as yet in minority, Pausanias, who was his cousin-german, had the tuition of him yet): by his licentious behaviour, and affectation of the barbarian customs, he gave much cause of suspicion that he meant not to live in the equality of the

present state. They considered also that he differed in manner of life from the discipline established: amongst other things by this, that upon the tripode at Delphi, which the Grecians had dedicated as the best of the spoil of the Medes, he had caused to be inscribed of himself in particular this elegiac verse:

Pausanias, Greek General,
Having the Medes defeated,
To Phœbus in record thereof
This gift hath consecrated.

Pausanias accused of practice with the Helots. He sends letters to the king, which are opened by the way. Post A. C. 469. Ol. 77. 4. Pausanias by the art of the ephori made to betray himself.

But the Lacedæmonians then presently defaced that inscription of the tripode, and engraved thereon by name all the cities that had joined in the overthrow of the Medes, and dedicated it so. This therefore was numbered amongst the offences of Pausanias, and was thought to agree with his present design, so much the rather for the condition he was now in. They had information farther, that he had in hand some practice with the Helots. And so he had: for he promised them, not only manumission, but also freedom of the city, if they would rise with him and co-operate in the whole business. But neither thus, upon some appeachment of the Helots, would they proceed against him, but kept the custom which they have in their own cases, not hastily to give a peremptory sentence against a Spartan without unquestionable proof. Till at length (as it is reported) purposing to send over to Artabazus his last letters to the king, he was bewrayed unto them by a man of Argilus, in time past his minion and most faithful to him: who being terrified with the cogitation, that not any of those which had been formerly sent had ever returned, got him a seal like to the seal of Pausanias, (to the end that if his jealousy were false, or that he should need to alter anything in

the letter, it might not be discovered), and opened the letter; wherein (as he had suspected the addition of some such clause) he found himself also written down to be murdered. 133. The ephori, when these letters were by him shown unto them, though they believed the matter much more than they did before, yet desirous to hear somewhat themselves from Pausanias his own mouth; the man being upon design gone to Tænarus into sanctuary, and having there built him a little room with a partition in which he hid the ephori, and Pausanias coming to him and asking the cause of his taking sanctuary, they plainly heard the whole matter. For the man both expostulated with him for what he had written about him, and from point to point discovered all the practice: saying, that though he had never boasted unto him these and these services concerning the king, he must yet have the honour as well as many other of his servants to be slain. And Pausanias himself both confessed the same things, and also bade the man not to be troubled at what was past, and gave him assurance to leave sanctuary, intreating him to go on in his journey with all speed, and not to frustrate the business in hand.

Post A. C. 469. Ol. 77. 4. He flieth into sanctuary. Post A. C. 469. Ol. 77. 4.

134. Now the ephori, when they had distinctly heard him, for that time went their way; and knowing now the certain truth, intended to apprehend him in the city. It is said, that when he was to be apprehended in the street, he perceived by the countenance of one of the ephori coming towards him, what they came for: and when another of them had by a secret beck signified the matter for good will, he ran into the close of the temple of Pallas Chalciœca, and got in before they overtook him; (now the temple itself was hard by); and entering into a house belonging to the temple, to avoid the injury of the open air, there staid. They that pursued him, could not then overtake him: but afterwards they took off the roof and the doors of

the house, and watching a time when he was within, beset the house and mured him up, and leaving a guard there famished him. When they perceived him about to give up the ghost, they carried him, as he was, out of the house, yet breathing; and being out he died immediately. After he was dead, they were about to throw him into the Cæada, where they use to cast in malefactors: yet afterwards they thought good to bury him in some place thereabouts. But the oracle of Delphi commanded the Lacedæmonians afterward, both to remove the sepulchre from the place where he died; (so that he lies now in the entry of the temple, as is evident by the inscription of the pillar); and also (as having been a pollution of the sanctuary) to render two bodies to the goddess of Chalciœca for that one. Whereupon they set up two brazen statues, and dedicated the same unto her for Pausanias. 135. Now the Athenians, the god himself having judged this a pollution of sanctuary, required the Lacedæmonians to banish out of their city such as were touched with the same.

Post A. C. 469. Ol. 77. 4. Themistocles in the same treason Themistocles, pursued by the Athenians and Peloponnesians, flieth to Corcyra. Thence is put over to the main land, and goeth to the king of the Molossians. Post A. C. 469. Ol. 77. 3.

At the same time that Pausanias came to his end, the Lacedæmonians by their ambassadors to the Athenians accused Themistocles, for that he also had Medised together with Pausanias, having discovered it by proofs against Pausanias; and desired that the same punishment might be likewise inflicted upon him. Whereunto consenting, (for he was at this time in banishment by ostracism, and though his ordinary residence was at Argos, he travelled to and fro in other places of Peloponnesus), they sent certain men in company of the Lacedæmonians, who were willing to pursue him, with command to bring him in wheresoever they could find him. 136. But Themistocles, having had notice of it beforehand, flieth out of Peloponnesus

into Corcyra; to the people of which city he had formerly been beneficial. But the Corcyraeans, alleging that they durst not keep him there, for fear of displeasing both the Lacedaemonians and the Athenians, convey him into the opposite continent: and being pursued by the men thereto appointed, asking continually which way he went, he was compelled at a strait to turn in unto Admetus, king of the Molossians, his enemy. The king himself being then from home, he became a suppliant to his wife; and by her was instructed to take their son with him, and sit down at the altar of the house. When Admetus not long after returned, he made himself known to him, and desired him, that though he had opposed him in some suit in Athens, not to revenge it on him now in the time of his flight: saying, that being now the weaker, he must needs suffer under the stronger; whereas noble revenge is of equals upon equal terms: and that he had been his adversary but in matter of profit, not of life; whereas, if he delivered him up, (telling him withal, for what and by whom he was followed), he deprived him of all means of saving his life. Admetus having heard him bade him arise, together with his son whom he held as he sat: which is the most submiss supplication that is.

Thence he is conveyed to Pydna. A. C. 466. Ol. 77. 3. In danger to be cast upon the Athenian fleet at Naxos, he maketh himself known to the master of the ship. A. C. 466. Ol. 78. 3. He arriveth at Ephesus. His Letter to Artaxerxes.

137. Not long after came the Lacedaemonians and the Athenians: and though they alleged much to have him, yet he delivered him not, but sent him away by land to Pydna upon the other sea, (a city belonging to Alexander), because his purpose was to go to the king: where finding a ship bound for Ionia, he embarked, and was carried by foul weather upon the fleet of the Athenians that besieged Naxos. Being afraid, he discovered to the master (for he was unknown) who he was, and for what he fled; and said, that unless he would save him, he meant to say that he had hired him

to carry him away for money; and that to save him, there needed no more but this, to let none go out of the ship till the weather served to be gone; to which if he consented, he would not forget to requite him according to his merit. The master did so; and having lain a day and a night at sea upon the fleet of the Athenians, he arrived afterwards at Ephesus. And Themistocles having liberally rewarded him with money, (for he received there both what was sent him from his friends at Athens, and also what he had put out at Argos), he took his journey upwards in company of a certain Persian of the low countries, and sent letters to the king Artaxerxes, the son of Xerxes, newly come to the kingdom, wherein was written to this purpose: “I, Themistocles, am coming unto thee, who, of all the Grecians, as long as I was forced to resist thy father that invaded me, have done your house the maniest damages; yet the benefits I did him were more, after once I with safety, he with danger was to make retreat. And both a good turn is already due unto me”, (writing here, how he had forewarned him of the Grecians’ departure out of Salamis, and ascribing the then not breaking of the bridge falsely unto himself), “and at this time to do thee many other good services, I present myself, persecuted by the Grecians for thy friendship’s sake. But I desire to have a year’s respite, that I may declare unto thee the cause of my coming myself.”

Post A. C. 466. The praise of Themistocles. His death. Post A. C. 464.

138. The king, as is reported, wondered what his purpose might be, and commanded him to do as he had said. In this time of respite he learned as much as he could of the language and fashions of the place. And a year after coming to the court, he was great with the king more than ever had been any Grecian before; both for his former dignity, and the hope of Greece, which he promised to bring into his subjection; but especially for the trial he gave of his wisdom. For Themistocles was a man in whom most truly was manifested the strength of natural judgment, wherein he had something

worthy admiration different from other men. For by his natural prudence, without the help of instruction before or after, he was both of extemporary matters upon short deliberation the best discerner, and also of what for the most part would be their issue the best conjecturer. What he was perfect in, he was able also to explicate: and what he was unpractised in, he was not to seek how to judge of conveniently. Also he foresaw, no man better, what was best or worst in any case that was doubtful. And (to say all in few words) this man, by the natural goodness of his wit, and quickness of deliberation, was the ablest of all men to tell what was fit to be done upon a sudden. But falling sick he ended his life: some say, he died voluntarily by poison, because he thought himself unable to perform what he had promised to the king. His monument is in Magnesia in Asia, in the market-place: for he had the government of that country, the king having bestowed upon him Magnesia, which yielded him fifty talents by the year, for his bread; and Lampsacus for his wine, (for this city was in those days thought to have store of wine); and the city of Myus for his meat. His bones are said by his kindred, to have been brought home by his own appointment, and buried in Attica unknown to the Athenians: for it was not lawful to bury one there, that had fled for treason. These were the ends of Pausanias the Lacedæmonian, and Themistocles the Athenian; the most famous men of all the Grecians of their time.

C. 432. Ol. 87. 1.

139. And this is that which the Lacedæmonians did command, and were commanded, in their first embassy, touching the banishment of such as were under the curse.

The Lacedæmonians by ambassadors command the abrogation of the act against the Megareans. A. C. 432. Ol. 87. 1. The last ambassadors from Lacedæmon require the Athenians to lay down their dominion. The Athenians consult what to answer.

After this they sent ambassadors again to Athens, commanding them to levy the siege from before Potidæa and to suffer Ægina to be free; but principally and most plainly telling them, that the war should not be made in case they would abrogate the act concerning the Megareans: by which act they were forbidden both the fairs of Attica, and all ports within the Athenian dominion. But the Athenians would not obey them, neither in the rest of their commands nor in the abrogation of that act: but recriminated the Megareans for having tilled holy ground and unset out with bounds; and for receiving of their slaves that revolted. But at length, when the last ambassadors from Lacedæmon were arrived, namely, Ramphias, Melesippus, and Agesander, and spake nothing of that which formerly they were wont, but only this, that “the Lacedæmonians desire that there should be peace, which may be had if you will suffer the Grecians to be governed by their own laws”: the Athenians called an assembly, and propounding their opinions amongst themselves, thought good, after they had debated the matter, to give them an answer once for all. And many stood forth and delivered their minds on either side, some for the war, and some that this act concerning the Megareans ought not to stand in their way to peace, but to be abrogated. And Pericles the son of Xantippus, the principal man at that time of all Athens, and most sufficient both for speech and action, gave his advice in such manner as followeth.

Oration of Pericles. A. C. 432. Ol. 87. 1. Oration of Pericles. A. C. 432. Ol. 87. 1. Oration of Pericles. A. C. 432. Ol. 87. 1. Oration of Pericles. A. C. 432. Ol. 87. 1. Oration of Pericles. A. C. 432. Ol. 87. 1. Oration of Pericles.

140. “Men of Athens, I am still not only of the same opinion, not to give way to the Peloponnessians; (notwithstanding I know that men have not the same passions in the war itself, which they have when they are incited to it, but change their opinions with the events); but also I see, that I must now

advise the same things, or very near to what I have before delivered. And I require of you with whom my counsel shall take place, that if we miscarry in aught, you will either make the best of it, as decreed by common consent; or if we prosper, not to attribute it to your own wisdom only. For it falleth out with the events of actions, no less than with the purposes of man, to proceed with uncertainty: which is also the cause, that when any thing happeneth contrary to our expectation, we use to lay the fault on fortune. That the Lacedæmonians, both formerly and especially now, take counsel how to do us mischief, is a thing manifest. For whereas it is said [in the articles], that in our mutual controversies we shall give and receive trials of judgment, and in the meantime either side hold what they possess; they never yet sought any such trial themselves, nor will accept of the same offered by us. They will clear themselves of their accusations by war, rather than by words: and come hither no more now to expostulate, but to command. For they command us to arise from before Potidæa, and to restore the Æginetæ to the liberty of their own laws, and to abrogate the act concerning the Megareans. And they that come last, command us to restore all the Grecians to their liberty. Now let none of you conceive that we shall go to war for a trifle, by not abrogating the act concerning Megara; (yet this by them is pretended most, and that for the abrogation of it war shall stay); nor retain a scruple in your minds, as if a small matter moved you to the war. For even this small matter containeth the trial and constancy of your resolution. Wherein if you give them way, you shall hereafter be commanded a greater matter, as men that for fear will obey them likewise in that. But by a stiff denial, you shall teach them plainly to come to you hereafter on terms of more equality. 141. Resolve therefore from this occasion, either to yield them obedience before you receive damage; or if we must have war, (which for my part I think is best), be the pretence weighty or light, not to give way, nor keep what we possess in fear. For a

great and a little claim, imposed by equals upon their neighbours before judgment by way of command, hath one and the same virtue, to make subject. As for the war, how both we and they be furnished, and why we are not like to have the worse, by hearing the particulars you shall now understand. The Peloponnesians are men that live by their labour, without money either in particular or in common stock. Besides, in long wars and by sea they are without experience; for that the wars which they have had one against another, have been but short through poverty. And such men can neither man their fleets, nor yet send out their armies by land very often; because they must be far from their own wealth, and yet by that be maintained, and be besides barred the use of the sea. It must be a stock of money, not forced contributions, that support the wars; and such as live by their labour, are more ready to serve the wars with their bodies than with their money. For they make account that their bodies will outlive the danger, but their money they think is sure to be spent; especially if the war (as it is likely) should last. So that the Peloponnesians and their confederates, though for one battle they be able to stand out against all Greece besides, yet to maintain a war against such as have their preparations of another kind, they are not able; inasmuch as not having one and the same counsel, they can speedily perform nothing upon the occasion; and having equality of vote and being of several races, every one will press his particular interest; whereby nothing is like to be fully executed. For some will desire to take revenge on some enemy, and others to have their estates least wasted. And being long before they can assemble, they take the lesser part of their time to debate the common business, and the greater to dispatch their own private affairs. And every one supposeth, that his own neglect of the common estate can do little hurt, and that it will be the care of somebody else to look to that for his own good: not observing how by these thoughts of every one in several, the common business is jointly ruined.

142. But their greatest hindrance of all, will be their want of money; which being raised slowly, their actions must be full of delay; which the occasions of war will not endure. As for their fortifying here and their navy, they are matters not worthy fear. For it were a hard matter for a city equal to our own in time of peace to fortify in that manner; much less in the country of an enemy, and we no less fortified against them. And if they had a garrison here, though they might, by excursions and by the receiving of our fugitives, annoy some part of our territory: yet would not that be enough both to besiege us, and also to hinder us from sallying into their territories and from taking revenge with our fleet; which is the thing wherein our strength lieth. For we have more experience in land-service by use of the sea, than they have in sea-service by use of the land. Nor shall they attain the knowledge of naval affairs easily. For yourselves, though falling to it immediately upon the Persian war, yet have not attained it fully. How then should husbandmen, not seamen, whom also we will not suffer to apply themselves to it by lying continually upon them with so great fleets, perform any matter of value? Indeed, if they should be opposed but with a few ships, they might adventure, encouraging their want of knowledge with store of men: but awed by many, they will not stir that way; and not applying themselves to it, will be yet more unskilful, and thereby more cowardly. For knowledge of naval matters is an art as well as any other, and not to be attended at idle times and on the by; but requiring rather, that whilst it is a-learning, nothing else should be done on the by. 143. But say they should take the money at Olympia and Delphi, and therewith, at greater wages, go about to draw from us the strangers employed in our fleet; this indeed, if going aboard both ourselves and those that dwell amongst us, we could not match them, were a dangerous matter. But now we can both do this, and (which is the principal thing) we have steersmen and other necessary men for the service of a ship, both more and better of our own

citizens, than are in all the rest of Greece. Besides that, not any of these strangers upon trial would be found content to fly his own country, and withal upon less hope of victory, for a few days' increase of wages, take part with the other side.

C. 432. Ol. 87. 1. Oration of Pericles.

“In this manner, or like to this, seemeth unto me to stand the case of the Peloponnesians: whereas ours is both free from what in theirs I have reprehended, and hath many great advantages besides. If they invade our territory by land, we shall invade theirs by sea. And when we have wasted part of Peloponnesus, and they all Attica; yet shall theirs be the greater loss. For they, unless by the sword, can get no other territory instead of that we shall destroy: whereas for us, there is other land both in the islands and continent. For the dominion of the sea is a great matter. Consider but this. If we dwelt in the islands, whether of us then were more inexpugnable? We must therefore now, drawing as near as can be to that imagination, lay aside the care of fields and villages; and not for the loss of them, out of passion, give battle to the Peloponnesians, far more in number than ourselves. For though we give them an overthrow, we must fight again with as many more: and if we be overthrown, we shall lose the help of our confederates, which are our strength; for when we cannot war upon them, they will revolt. Nor bewail ye the loss of fields or houses, but of men's bodies: for men may acquire these, but these cannot acquire men. And if I thought I should prevail, I would advise you to go out and destroy them yourselves; and show the Peloponnesians, that you will never the sooner obey them for such things as these.

C. 432. Ol. 87. 1. Oration of Pericles. A. C. 432. Ol. 87. 1. Oration of Pericles.

144. “ There be many other things that give hope of victory, in case you do not, whilst you are in this war, strive to enlarge your dominion, and

undergo other voluntary dangers; (for I am afraid of our own errors, more than of their designs); but they shall be spoken of at another time, in prosecution of the war itself. For the present, let us send away these men with this answer: ‘that the Megareans shall have the liberty of our fairs and ports, if the Lacedæmonians will also make no banishment of us nor of our confederates as of strangers’: for neither our act concerning Megara, nor their banishment of strangers, is forbidden in the articles: ‘also, that we will let the Grecian cities be free, if they were so when the peace was made; and if the Lacedæmonians will also give leave unto their confederates to use their freedom, not as shall serve the turn of the Lacedæmonians, but as they themselves shall every one think good: also that we will stand to judgment according to the articles, and will not begin the war, but be revenged on those that shall’. For this is both just, and for the dignity of the city to answer. Nevertheless you must know, that of necessity war there will be; and the more willingly we embrace it, the less pressing we shall have our enemies; and that out of the greatest dangers, whether to cities or private men, arise the greatest honours. For our fathers, when they undertook the Medes, did from less beginnings, nay abandoning the little they had, by wisdom rather than fortune, by courage rather than strength, both repel the barbarian and advance this state to the height it now is at. Of whom we ought not now to come short, but rather to revenge us by all means upon our enemies; and do our best to deliver the state unimpaired by us to posterity.”

The answer of the Athenians to the ambassadors of Lacedæmon.

145. Thus spake Pericles. The Athenians liking best of his advice, decreed as he would have them; answering the Lacedæmonians according to his direction, both in particulars as he had spoken, and generally, “that they would do nothing on command, but were ready to answer their accusations upon equal terms by way of arbitrement”. So the ambassadors went home; and after these there came no more.

146. These were the quarrels and differences on either side, before the war: which quarrels began presently upon the business of Epidamnus and Corcyra. Nevertheless there was still commerce betwixt them, and they went to each other without any herald, though not without jealousy. For the things that had passed were but the confusion of the articles, and matter of the war to follow.

**THE SECOND BOOK OF THE HISTORY OF
THUCYDIDES.**

THE PRINCIPAL CONTENTS.

THE ENTRY OF the Theban soldiers into Plataea by the treason of some within. — Their repulse and slaughter. — The irruption of the Peloponnesians into Attica. — The wasting of the coast of Peloponnesus by the Athenian fleet. — The public funeral of the first slain. — The second invasion of Attica. — The pestilence in the city of Athens. — The Ambraciotes war against the Amphilochi. — Plataea assaulted: besieged. — The Peloponnesian fleet beaten by Phormio before the strait of the Gulf of Crissa. — The same fleet repaired and reinforced; and beaten again by Phormio before Naupactus. — The attempt of the Peloponnesians on Salamis. — The fruitless expedition of the Thracians against the Macedonians. This in the first three years of the war.

Year 1. A. C. 431. Ol. 87. 1.

The war between the Athenians and the Peloponnesians beginneth now from the time they had no longer commerce one with another without a herald, and that having once begun it they warred without intermission. And it is written in order by summers and winters, according as from time to time the several matters came to pass.

Year 1. A. C. 431. Ol. 87. 1. Plataea surprised by the Thebans by treason. year 1. A. C. 431. Ol. 87. 1. The Thebans execute not the design of the traitors: but offer composition.

The peace, which after the winning of Eubœa, was concluded for thirty years, lasted fourteen years. But in the fifteenth year, being the forty-eighth of the priesthood of Chrysis in Argos: Ænesias being then ephor at Sparta,

and Pythadorus, archon of Athens, having then two months of his government to come: in the sixth month after the battle at Potidæa and in the beginning of the spring, three hundred and odd Thebans, led by Pythangelus the son of Phyleides, and Diemporus the son of Onetoridas, Bœotian rulers, about the first watch of the night entered with their arms into Plataea, a city of Bœotia and confederate of the Athenians. They were brought in, and the gates opened unto them, by Naucleides and his complices, men of Plataea, that for their own private ambition intended both the destruction of such citizens as were their enemies, and the putting of the whole city under the subjection of the Thebans. This they negotiated with one Eurymachus the son of Leontiadas, one of the most potent men of Thebes. For the Thebans foreseeing the war, desired to preoccupate Plataea, which was always at variance with them, whilst there was yet peace and the war not openly on foot. By which means they more easily entered undiscovered, there being no order taken before for a watch. And making a stand in their arms in the market-place, they did not, as they that gave them entrance would have had them, fall presently to the business, and enter the houses of their adversaries; but resolved rather to make favourable proclamation, and to induce the city to composition and friendship. And the herald proclaimed, “that if any man, according to the ancient custom of all the Bœotians, would enter into the same league of war with them, he should come and bring his arms to theirs”: supposing the city by this means would easily be drawn to their side.

The Plataeans accept it. year 1. A. C. 431. Ol. 87. 1. The Plataeans take heart: and unite themselves by digging through the common walls of their houses. They assault the Thebans. year 1. A. C. 431. Ol. 87. 1. The Thebans fly, but cannot get out. year 1. A. C. 431. Ol. 87. 1. The Thebans penned up in a house, which they entered into by mistaking the door for the city gate. They yield to discretion.

The Plataeans, when they perceived that the Thebans were already entered and had surprised the city, through fear, and opinion that more were entered than indeed were, (for they could not see them in the night), came to composition, and accepting the condition rested quiet; and the rather, for that they had yet done no man harm. But whilst that these things were treating, they observed that the Thebans were not many; and thought that if they should set upon them, they might easily have the victory. For the Plataean commons were not willing to have revolted from the Athenians. Wherefore it was thought fit to undertake the matter; and they united themselves by digging through the common walls between house and house, that they might not be discovered as they passed the streets. They also placed carts in the streets without the cattle that drew them, to serve them instead of a wall; and every other thing they put in readiness, as they severally seemed necessary for the present enterprise. When all things according to their means were ready, they marched from their houses towards the enemies; taking their time whilst it was yet night, and a little before break of day; because they would not have to charge them when they should be emboldened by the light and on equal terms, but when they should by night be terrified, and inferior to them in knowledge of the places of the city. So they forthwith set upon them, and came quickly up to hand strokes. 4. And the Thebans seeing this, and finding they were deceived, cast themselves into a round figure, and beat them back in that part where the assault was made: and twice or thrice they repulsed them. But at last, when both the Plataeans themselves charged them with a great clamour, and their wives also and families shouted and screeched from the houses, and withal threw stones and tiles amongst them; the night having been also very wet; they were afraid, and turned their backs and fled here and there about the city; ignorant for the most part, in the dark and dirt, of the ways out by which they should have been saved; (for this accident fell out upon the

change of the moon); and pursued by such as were well acquainted with the ways to keep them in: insomuch as the greatest part of them perished. The gate by which they entered, and which only was left open, a certain Plataean shut up again with the head of a javelin, which he thrust into the staple instead of a bolt: so that this way also their passage was stopped. As they were chased up and down the city, some climbed the walls and cast themselves out, and for the most part died. Some came to a desert gate of the city, and with a hatchet given them by a woman cut the staple, and got forth unseen: but these were not many; for the thing was soon discovered. Others again were slain dispersed in several parts of the city. But the greatest part, and those especially who had cast themselves before into a ring, happened into a great edifice adjoining to the wall; the doors whereof, being open, they thought had been the gates of the city, and that there had been a direct way through to the other side. The Plataeans seeing them now pent up, consulted whether they should burn them as they were, by firing the house, or else resolve of some other punishment. At length both these, and all the rest of the Thebans that were straggling in the city, agreed to yield themselves and their arms to the Plataeans at discretion. And this success had they that entered into Plataea.

The whole power of Thebes come to rescue their fellows. year 1. A. C. 431. Ol. 87. 1. The Thebans seek to intercept the Plataeans in the villages. The Plataeans send to the Thebans to be gone, and promise to release their prisoners. The Thebans go off, and the Plataeans fetch in their men and goods, and kill their prisoners. year 1. A. C. 431. Ol. 87. 1.

But the rest of the Thebans, that should with their whole power have been there before day, for fear the surprise should not succeed with those that were in, came so late with their aid that they heard the news of what was done by the way. Now Plataea is from Thebes seventy furlongs, and they marched the slower for the rain which had fallen the same night. For

the river Asopus was swollen so high, that it was not easily passable. So that what by the foulness of the way, and what by the difficulty of passing the river, they arrived not till their men were already some slain and some taken prisoners. When the Thebans understood how things had gone, they lay in wait for such of the Plataëans as were without: (for there were abroad in the villages both men and household stuff, as was not unlikely, the evil happening unexpectedly and in time of peace): desiring, if they could take any prisoners, to keep them for exchange for those of theirs within, which (if any were so) were saved alive. This was the Thebans' purpose. But the Plataëans, whilst they were yet in council, suspecting that some such thing would be done, and fearing their case without, sent a herald unto the Thebans: whom they commanded to say, that what they had already done, attempting to surprise their city in time of peace, was done wickedly; and to forbid them to do any injury to those without, and that otherwise they would kill all those men of theirs that they had alive; which, if they would withdraw their forces out of their territory, they would again restore unto them. Thus the Thebans say; and that the Plataëans did swear it. But the Plataëans confess not that they promised to deliver them presently, but upon treaty if they should agree; and deny that they swore it. Upon this the Thebans went out of their territory; and the Plataëans, when they had speedily taken in whatsoever they had in the country, immediately slew their prisoners. They that were taken were one hundred and eighty; and Eurymachus, with whom the traitors had practised, was one. 6. When they had done they sent a messenger to Athens, and gave truce to the Thebans to fetch away the bodies of their dead; and ordered the city as was thought convenient for the present occasion.

The Athenians lay hands on such Bœotians as were in Attica. They victual Plataea, and put a garrison into it, and take their unnecessary people.

The news of what was done coming straightway to Athens, they instantly laid hands on all the Bœotians then in Attica; and sent an officer to Plataea, to forbid their farther proceeding with their Theban prisoners, till such time as they also should have advised of the matter: for they were not yet advertised of their putting to death. For the first messenger was sent away when the Thebans first entered the town; and the second, when they were overcome and taken prisoners: but of what followed after they knew nothing. So that the Athenians when they sent, knew not what was done; and the officer arriving found that the men were already slain. After this, the Athenians sending an army to Plataea, victualled it and left a garrison in it; and took thence both the women and children, and also such men as were unserviceable for the war.

Preparation of both sides for the war. year 1. A. C 431. Ol. 87 1.
Prophecies and oracles preceding the war. year 1. A. C. 431. Ol. 87. 1.

7. This action falling out at Plataea, and the peace now clearly dissolved, the Athenians prepared themselves for war; so also did the Lacedæmonians and their confederates; intending on either part to send ambassadors to the king, and to other barbarians, wheresoever they had hope of succours; and contracting leagues with such cities as were not under their own command. The Lacedæmonians besides those galleys which they had in Italy and Sicily, of the cities that took part with them there, were ordered to furnish, proportionably to the greatness of their several cities, so many more as the whole number might amount to five hundred sail, and to provide a sum of money assessed; and in other things not to stir farther, but to receive the Athenians coming but with one galley at once, till such time as the same should be ready. The Athenians, on the other side, surveyed their present confederates, and sent ambassadors to those places that lay about Peloponnesus, as Corcyra, Cephalonia, Acarnania, and Zacynthus; knowing that as long as these were their friends, they might with the more security

make war round about upon the coast of Peloponnesus. 8. Neither side conceived small matters, but put their whole strength to the war: and not without reason. For all men in the beginnings of enterprises are the most eager. Besides, there were then in Peloponnesus many young men, and many in Athens, who for want of experience not unwillingly undertook the war. And not only the rest of Greece stood at gaze to behold the two principal states in combat; but many prophecies were told, and many sung by the priests of the oracles, both in the cities about to war and in others. There was also a little before this an earthquake in Delos, which in the memory of the Grecians never shook before; and was interpreted for, and seemed to be a sign of what was to come afterwards to pass. And whatsoever thing then chanced of the same nature, it was all sure to be inquired after.

The affections of the Grecians towards the combatant states.

But men's affections for the most part went with the Lacedæmonians; and the rather, for that they gave out they would recover the Grecians' liberty. And every man, both private and public person, endeavoured as much as in them lay both in word and deed to assist them; and thought the business so much hindered, as himself was not present at it. In such passion were most men against the Athenians; some for desire to be delivered from under their government, and others for fear of falling into it. And these were the preparations and affections brought unto the war.

Year 1. A. C. 431. Ol. 87. 1. The confederates of the Lacedæmonians. The confederates of the Athenians.

9. But the confederates of either party, which they had when they began it, were these. The Lacedæmonians had all Peloponnesus within the isthmus, except the Argives and Achæans: (for these were in amity with both, save that the Pellenians at first, only of all Achaia, took their part; but afterwards all the rest did so likewise): and without Peloponnesus, the

Megareans, Locrians, Bœotians, Phoceans, Ambraciotes, Leucadians, and Anactorians. Of which the Corinthians, Megareans, Sicyonians, Pellenians, Eleians, Ambraciotes, and Leucadians found shipping: the Bœotians, Phoceans, and Locrians, horsemen: and the rest of the cities footmen. And these were the confederates of the Lacedæmonians. The Athenian confederates were these. The Chians, Lesbians, Platæans, the Messenians in Naupactus, most of the Acarnanians, Corcyræans, Zacynthians, and other cities their tributaries amongst those nations; also that part of Caria which is on the sea-coast, and the Dorians adjoining to them; Ionia, Hellespont, the cities bordering on Thrace; all the islands from Peloponnesus to Crete on the east, and all the rest of the Cyclades, except Melos and Thera. Of these the Chians, Lesbians, and Corcyræans found galleys; the rest footmen and money. These were their confederates and the preparation for the war on both sides.

Year 1. A. C. 431. Ol. 87. 1. The Lacedæmonian league meet in the isthmus.
